## PREFACE

THE NEW INTERNATIONAL YEAR BOOK, of which the present volume is the 30th issue, along with the NEW INTERNATIONAL ENCYCLOPÆDIA, during the year 1931 passed from the ownership of its founders into the control of FUNK AND WAGNALLS COMPANY. It is most appropriate that these two long-established reference works thus should become essential and important elements in an extensive list of publications that range from the weekly *Literary Digest* to the permanent *Standard Dictionary* and henceforth should bear the imprint of an international publishing organization. In the YEAR BOOK no change of editorial policy or plan has been involved, so that this 1931 annual comes to the ever-increasing number of world-minded readers as a comprehensive summary of one of the most interesting periods known to history.

At no time since the World War had any single nation been sufficient unto itself, but in 1931 this was specially emphasized in matters of national policy as well as in world economics. The now familiar financial depression was quite as evident in the East Indies, as it was in Europe and America in 1931. No one nation was strong enough to resist economic currents, as witness "the flight from the pound" of GREAT BRITAIN, a nation which united under a National Government to meet and face unprecedented conditions at home and abroad. With the abandonment of the gold standard and of free trade, came the epoch-marking Statute of Westminster, fixing the constitutional status of the British Dominions. In INDIA was recorded a truce between Gandhi and Lord Irwin leading to the Indian Round-Table Conference at London, only to be broken later. GERMANY continued a storm centre with the Hitler movement provoking widespread concern, and various financial and economic decrees were promulgated. In FRANCE, national anxieties prevailed, notwithstanding the flow of gold to Paris, and the visit of Premier Laval to Washington. In SPAIN must be marked the establishment of a republic after years of political threats and uprisings, while the UNION OF SOVIET SOCIALIST REPUBLICS, approached the completion of the Five-Year Plan, with a changed attitude of Stalin toward capitalism.

ASIA continued to present problems of grave concern to the world with CHINA in chaos and the government of Chiang Kai-Shek overthrown. An aggressive JAPAN was active in MANCHURIA in the face of remonstrance by the United States and the Council of the League of Nations. In AUSTRALIA, as a result of a general election, the Labor Government was ousted, while the Labor Party in NEW ZEALAND suffered substantial losses in the elections. The PHILIPPINE ISLANDS continued their agitation for independence and separation from the United States, while in HAWAII were manifested various forms of disorder. In South and Central America revolution was noted, as in CHILE, CUBA, SALVADOR, PARAGUAY, and HONDURAS, but on the other hand, the restoration of constitutional government in BOLIVIA and PERU could be recorded. In the Chaco new clashes occurred.

Looking at the European political situation broadly, the never-ending question of REPARATIONS had a new feature in the MORATORIUM proposed by President Hoover, while the LEAGUE OF NATIONS continued its formal activity. A feature of the year was the general tendency towards higher tariffs and restrictions of exchange, which acted to increase the economic disarrangement. Increased taxation prevailed and financial problems seemed greater than at the time of the World War.

## PREFACE

In the UNITED STATES, economic depression did not prevent active discussion of foreign and domestic political questions. Inevitably America came into contact with world problems in matters of world concern, while its position as a creditor nation in the midst of universal depression was far from enviable. In NICARAGUA and HAITI the United States inaugurated the withdrawal of its armed forces, and in the Far East was attempting to make its policy felt in an atmosphere which lacked international agreement. Notwithstanding disturbed foreign interests and a reduced foreign commerce and diminished gold resources, domestic politics, preliminary to a Presidential Campaign, held the attention of the American people. In connection with attempts to relieve financial depression and UNEMPLOYMENT, discussion in the national legislature was more general than definite, with few clearly defined issues between the great parties. Attempts were made to develop a policy that would meet the ever-increasing deficit in national finances. During 1931 nearly all of the State legislatures were in session and the usual grist of legislation ground included much both in the nature of unemployment relief and increased taxation. As a result of the times, social legislation and WELFARE WORK were more prominent than ever, though often without definite policy on the part of public or private authorities. PROHIBITION continued to be a topic of never-dying interest, discussed with varying degrees of heat and intelligence, not infrequently associated with collateral topics as in the consideration of CRIME made by the Wickersham Commission in its final report.

The Editors of the 1931 YEAR BOOK have not merely recorded the leading events but have endeavored to correlate the chronicle in a comprehensive picture. Each year the YEAR BOOK is able to call attention to new and special features. There is presented for the first time a CHRONOLOGY of important events the world over. Such a list, with its chronological arrangement has the further advantage of serving as an index, for under the country concerned or in the special field of knowledge involved, there also is adequate discussion of the event or circumstance. An increased NECROLOGY deals with those who died in 1931, while the article on the CENSUS includes the correct figures of population of cities and towns as revealed in the United States Census of 1930. Most of the contributors familiar to our readers again are represented by articles. A competent jurist discusses LAW and its progress, while new contributors of high professional qualifications write on NAVAL PROGRESS and on PAINTING, SCULPTURE, and ART EXHIBITIONS.

As usual, the YEAR BOOK in its articles on BANKS AND BANKING, BUSINESS REVIEW, FINANCIAL REVIEW, PUBLIC FINANCE, and TAXATION summarizes the important features of the year, particularly as they concern the United States. In SURGERY and MEDICINE the alleviation of such diseases as angina pectoris, poliomyelitis, influenza, and the common cold is treated. The YEAR BOOK through the interest of many correspondents is able to present the usual interesting summary of the activity of the UNIVERSITIES AND COLLEGES, while various learned, philanthropic, and other organizations contribute the summaries that indicate progress in the advancement of their special work. The reader, seeking the usual reviews in LITERATURE, THEATRE, SCIENCE, ENGINEERING, PHILOSOPHY, and HISTORY, will not be disappointed, and the bibliography found so valuable in earlier YEAR BOOKS has been extended. This year the illustration of the YEAR BOOK has been increased twofold so as to supplement the text by appropriate picture and diagram. As usual the Editor is under obligations to many government and other agencies whose cordial coöperation and assistance contributes in no small degree to the established character of this work.

HERBERT TREADWELL WADE

**EDITOR**  
**HERBERT TREADWELL WADE**  
**LIST OF CONTRIBUTORS**

**AGRICULTURE; AGRICULTURAL EXPERIMENT STATIONS; COTTON; TOBACCO**

HENRY M. STEECE, B.S. (AGR.), A.M.,  
SPECIALIST IN AGRONOMY, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

**AGRICULTURAL EXTENSION WORK**

REUBEN BRIGHAM, B.S. (AGR.),  
SENIOR AGRICULTURIST, IN CHARGE OF VISUAL INSTRUCTION AND EDITORIAL WORK, OFFICE OF COÖPERATIVE EXTENSION WORK, EXTENSION SERVICE, UNITED STATES DEPARTMENT OF AGRICULTURE.

**ANTHROPOLOGY (WITH ETHNOLOGY)**

LESLIE SPIER, PH.D.,  
RESEARCH ASSOCIATE IN ANTHROPOLOGY AND LINGUISTICS, YALE UNIVERSITY.

**ARCHÆOLOGY**

OLIVER SAMUEL TONKS, PH.D.,  
PROFESSOR OF ART, VASSAR COLLEGE.

**ARCHITECTURE**

TALBOT F. HAMLIN,  
MEMBER OF AMERICAN INSTITUTE OF ARCHITECTS.

**ASTRONOMY; METEOROLOGY; EARTHQUAKES; FLOODS; SEISMOLOGY**

EDGAR W. WOOLARD, PH.D.,  
DEPARTMENT OF MATHEMATICS, GEORGE WASHINGTON UNIVERSITY.

**AUTOMOBILES**

HENRY R. COBLEIGH, M.E.,  
MEMBER OF STAFF, NATIONAL AUTOMOBILE CHAMBER OF COMMERCE.

**BIOGRAPHY**

MARY CLAPP

**BOTANY**

CHARLES L. POLLARD, A.M.

**CHEMISTRY; EXPOSITIONS; CELEBRATIONS**

MARCUS BENJAMIN, PH.D., Sc.D., LL.D.,  
EDITOR FOR THE UNITED STATES NATIONAL MUSEUM.

**CIVIL ENGINEERING**

JAMES K. FINCH, C.E.,  
PROFESSOR OF CIVIL ENGINEERING, COLUMBIA UNIVERSITY.

**CROP PRODUCTION; UNITED STATES DEPARTMENT OF AGRICULTURE**

JOHN I. SCHULTE, B. AGR.,  
OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

**DAIRYING; LIVESTOCK; WOOL**

GEORGE HAINES, B.S., M.S., PH.D.,  
SENIOR ANIMAL HUSBANDMAN, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

**DRAMA AND THEATRE**

RALPH W. CAREY,  
NEW YORK DRAMATIC CORRESPONDENT, *The Hartford Courant*.

**ECONOMIC ENTOMOLOGY; VETERINARY MEDICINE**

WILLIAM A. HOOKER, B.S.C., LL.M., D.V.M.,  
OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

**ECONOMIC, SOCIAL, AND POLITICAL SCIENCE SUBJECTS**

LOUIS M. HACKER, A.M.,  
EDITORIAL STAFF, *Encyclopædia of the Social Sciences*; CO-AUTHOR *United States Since 1865*.

**EDUCATION; UNIVERSITIES**

MIL0 B. HILLEGAS, PH.D., LL.D.,  
PROFESSOR OF EDUCATION, COLUMBIA UNIVERSITY.

**ELECTRICAL ENGINEERING**

WALTER I. SLICHTER, E.E.,  
PROFESSOR OF ELECTRICAL ENGINEERING, COLUMBIA UNIVERSITY.

**FERTILIZERS AND SOILS**

ROBERT W. TRULLINGER, C.E.,  
ASSISTANT IN EXPERIMENT STATION ADMINISTRATION, SENIOR AGRICULTURAL ENGINEER, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

**FINANCE; BANKING; BUSINESS REVIEW; TAXATION**

H. PARKER WILLIS, PH.D.,  
PROFESSOR OF BANKING, COLUMBIA UNIVERSITY.

**FIRE PROTECTION**

ROBERT S. MOULTON,  
NATIONAL FIRE PROTECTION ASSOCIATION.

**FOOD AND NUTRITION; VITAMINS**

SYBIL L. SMITH, A.M.,  
SENIOR CHEMIST, OFFICE OF EXPERIMENT STATIONS, EDITOR, FOODS AND NUTRITION, *Experiment Station Record*, UNITED STATES DEPARTMENT OF AGRICULTURE.

**FORESTRY AND HORTICULTURE**

JOSEPH W. WELLINGTON, M.Sc.,  
HORTICULTURIST, OFFICE OF EXPERIMENT STATIONS, UNITED STATES DEPARTMENT OF AGRICULTURE.

**FRENCH LITERATURE**

ALBERT SCHINZ, PH.D.,  
PROFESSOR OF ROMANTIC LANGUAGES AND LITERATURES, UNIVERSITY OF PENNSYLVANIA.

**GEOLOGY**

WILLIAM M. AGAR, M.S., PH.D.,  
PROFESSOR OF GEOLOGY, COLUMBIA UNIVERSITY.

**GERMAN LITERATURE**

AMELIA VON ENDE.

**INSURANCE**

WILLIAM S. CRAWFORD,  
INSURANCE EDITOR, *The Journal of Commerce*.

**INTERNATIONAL ARBITRATION; INTERNATIONAL LAW; LEAGUE OF NATIONS; WORLD COURT; PEACE; ETC.**

CLINTON ROGERS WOODRUFF, LL.D.,  
HONORARY SECRETARY OF THE NATIONAL MUNICIPAL LEAGUE AND MEMBER OF THE MOHONK CONFERENCE; DIRECTOR OF PUBLIC WELFARE, PHILADELPHIA.

## ITALIAN LITERATURE

O. A. BONTEMPO, PH.C.,  
ROMANCE LANGUAGE DEPARTMENTS, COLUMBIA  
UNIVERSITY AND NEW YORK UNIVERSITY; DI-  
RECTOR, ITALICA ASSOCIATION OF AMERICA;  
EDITORIAL STAFF, *Romanic Review*.

## LABOR LEGISLATION

JOHN B. ANDREWS, PH.D.,  
SECRETARY OF THE AMERICAN ASSOCIATION FOR  
LABOR LEGISLATION AND EDITOR, *American  
Labor Legislation Review*.

## LAW, PROGRESS AND DEVELOPMENT

CHARLES SUMNER LOBINGIER, PH.D.,  
D.C.L., J.U.D., J.D.,  
JUDGE, COURT OF FIRST INSTANCE, PHILIPPINES,  
1914-18; JUDGE, UNITED STATES COURT FOR  
CHINA, 1914-24; PROFESSOR OF CIVIL AND COM-  
PARATIVE LAW, NATIONAL UNIVERSITY, WASH-  
INGTON, D. C., 1925.

## LITERATURE, ENGLISH AND AMERI- CAN

WILLIAM BENFIELD PRESSEY, A.M.,  
PROFESSOR OF ENGLISH, DARTMOUTH COLLEGE.

## MEDICINE AND SURGERY

H. WALTON COCHRAN, M.D.,  
JUNIOR FELLOW IN SURGERY, PRESBYTERIAN HOS-  
PITAL, NEW YORK CITY; ASSISTANT IN SURGERY,  
COLLEGE OF PHYSICIANS AND SURGEONS, COLUM-  
BIA UNIVERSITY.

## METALLURGY

EDWARD HODGES ROBIE,  
ASSISTANT SECRETARY, THE AMERICAN INSTI-  
TUTE OF MINING AND METALLURGICAL ENGI-  
NEERS.

## MILITARY PROGRESS

JOHN J. BRADLEY,  
BRIGADIER GENERAL, UNITED STATES ARMY,  
RETIRED.

## MINERALOGY

HERBERT P. WHITLOCK, C.E.,  
CURATOR, DEPARTMENT OF MINERALOGY, AMERI-  
CAN MUSEUM OF NATURAL HISTORY, NEW YORK.

## MOTION PICTURES

RICHARD WATTS, JR.,  
EDITORIAL DEPARTMENT, *New York Herald  
Tribune*.

## MUSIC

FRANCIS DAVENPORT PERKINS,  
ASSISTANT MUSIC CRITIC, *New York Herald  
Tribune*.

## NAVAL PROGRESS

C. H. McMORRIS,  
COMMANDER, UNITED STATES NAVY; EDITOR,  
*Journal of UNITED STATES NAVAL INSTITUTE*.

## PAINTING AND SCULPTURE

MARGARET R. SCHERER,  
ASSISTANT TO THE SECRETARY, THE METRO-  
POLITAN MUSEUM OF ART

## PHILOLOGY (CLASSICAL)

CHARLES KNAPP, PH.D.,  
PROFESSOR OF GREEK AND LATIN, BARNARD COL-  
LEGE, COLUMBIA UNIVERSITY; MANAGING EDITOR,  
*The Classical Weekly*.

## PHILOLOGY (MODERN)

JOHN LAWRENCE GERIG, A.M., PH.D.,  
LITT.D.,  
AD. HON. (UNIVERSITY OF ROME); PROFESSOR OF  
CELTIC DEPARTMENT OF ROMANCE LANGUAGES,  
COLUMBIA UNIVERSITY; HON. MEMBER, ITALIAN  
ACADEMY OF SCIENCES AND LETTERS; HON. DI-  
RECTOR, DEPARTMENT OF SPANISH STUDIES,  
UNIVERSITY OF PORTO RICO; AMERICAN MEMBER,

INTERNATIONAL COMMITTEE OF EXPERTS IN  
LINGUISTIC BIBLIOGRAPHY; AMERICAN MEMBER,  
INTERNATIONAL COMMISSION OF LITERARY HIS-  
TORY; EDITOR-IN-CHIEF, *Romanic Review*.

## PHILOSOPHY

V. JERAULD MCGILL, PH.D.,  
LECTURER AT HUNTER COLLEGE, NEW YORK.

## PHOTOGRAPHY

GLENN E. MATTHEWS, M.SC., F.R.P.S.,  
TECHNICAL EDITOR, KODAK RESEARCH LABORA-  
TORIES, ROCHESTER, N. Y.

## PHYSICS

HENRY D. HUBBARD,  
SECRETARY, U. S. BUREAU OF STANDARDS.

## POLITICAL HISTORY AND GAZETTEER

RONALD S. KAIN,  
EDITOR FOR FOREIGN POLITICS, GEOGRAPHY, AND  
STATISTICS.

## POWER ENGINEERING; POWER PLANTS; ETC.

ALFRED D. BLAKE, M.E.,  
MANAGING EDITOR OF *Power*.

## PSYCHICAL RESEARCH

THEODORE BESTERMAN,  
LIBRARIAN AND EDITOR OF THE SOCIETY FOR PSY-  
CHICAL RESEARCH, LONDON.

## PSYCHOLOGY

ALBERT T. POFFENBERGER, PH.D., SC.D.,  
PROFESSOR OF PSYCHOLOGY, COLUMBIA UNIVER-  
SITY.

## RAILWAYS

WILLIAM E. HOOPER,  
FORMER FINANCIAL EDITOR, *Railway Age*.

## RELIGIOUS BODIES AND SOCIETIES

MARY CLAPP,  
OFFICE EDITOR.

## ROMAN CATHOLIC CHURCH

THOMAS F. MEEHAN,  
EDITORIAL STAFF, *America*.

## SANITARY ENGINEERING AND MUNI- CIPAL SUBJECTS

MOSES NELSON BAKER, PH.D., C.E.,  
ASSOCIATE EDITOR, *Engineering News-Record*.

## SCANDINAVIAN LITERATURE

HARRY V. E. PALMBLAD, PH.D.,  
PROFESSOR OF GERMAN AND FRENCH, PHILLIPS  
UNIVERSITY.

## SPANISH LITERATURE; SPANISH- AMERICAN LITERATURES

JOHN D. FITZ-GERALD, PH.D., LITT.D.,  
PROFESSOR OF ROMANCE PHILOLOGY AND HEAD  
OF THE DEPARTMENT OF SPANISH, UNIVERSITY OF  
ARIZONA; CORRESPONDING MEMBER OF THE  
SPANISH ROYAL ACADEMY, AND OF THE ROYAL  
ACADEMY OF HISTORY OF MADRID; HONORARY  
MEMBER OF THE NATIONAL ACADEMY OF ARTS  
AND LETTERS OF CUBA.

## SPORTS

CASWELL ADAMS,  
SPORTS DEPARTMENT, *New York Herald Tribune*.

## TELEVISION

JOHN B. RUSSELL, B.SC.,  
INSTRUCTOR IN ELECTRICAL ENGINEERING, CO-  
LUMBIA UNIVERSITY.

## UNITED STATES AND STATE ARTICLES

PHILIP COAN,  
EDITORIAL STAFF, *The Brooklyn Daily Eagle*;  
FORMER EDITOR, *The New York Sun*.

## ZOOLOGY

AARON L. TREADWELL, PH.D.,  
DEPARTMENT OF ZOOLOGY, VASSAR COLLEGE.

## KEY TO PRONUNCIATION

<b>æ</b>	as in <i>ale, fate</i> . Also see <b>ē</b> , below.	<b>ð</b>	as in the Spanish <i>Almodovar, pulgada</i> , where it is nearly like <i>th</i> in English <i>then</i> , this.
<b>æ</b>	" " <i>senate, chaotic</i> .	<b>g</b>	" " <i>go, get</i> .
<b>ā</b>	" " <i>glare, care, and as e in there</i> . See <b>ē</b> , below.	<b>g</b>	" " the German <i>Landtag</i> , and <i>ch</i> in <i>Feuerbach, buch</i> ; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
<b>ā</b>	" " <i>am, at</i> .	<b>h</b>	" <i>j</i> in the Spanish <i>Jijona, g</i> in the Spanish <i>gila</i> ; where it is a fricative somewhat resembling the sound of <i>h</i> in English <i>hue</i> or <i>y</i> in <i>yet</i> , but stronger.
<b>ā</b>	" " <i>arm, father</i> .	<b>hw</b>	" <i>wh</i> in <i>which</i> .
<b>ā</b>	" " <i>ant, and final a in America, armada, etc.</i> In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short <i>u</i> ( <i>ū</i> ).	<b>κ</b>	" <i>ch</i> in the German <i>ich, Albrecht</i> , and <i>g</i> in the German <i>Arensberg, Mecklenburg</i> ; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of <i>h</i> in <i>hue</i> , or <i>y</i> in <i>yet</i> ; or the sound made by beginning to pronounce a <i>k</i> , but not completing the stoppage of the breath. The character <b>κ</b> is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of <i>kh</i> in the word <i>Khan</i> .
<b>α</b>	" " <i>final, regal, where it is of a neutral or obscure quality</i> .	<b>ñ</b>	" " in <i>sinker, longer</i> .
<b>α</b>	" " <i>all, fall</i> .	<b>ng</b>	" " <i>sing, long</i> .
<b>α</b>	" " <i>eve</i> .	<b>n</b>	" " the French <i>bon, Bourbon</i> , and <i>m</i> in the French <i>Étampes</i> ; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by <b>n</b> , as in the case of <i>São Antão</i> .
<b>ē</b>	" " <i>elate, evade</i> .	<b>sh</b>	" " <i>shine, shut</i> .
<b>ē</b>	" " <i>end, pet</i> . The characters <b>ē, ā, and d</b> are used for <b>ā, æ</b> in German, as in <i>Baedeker, Gräfe, Handel</i> , to the values of which they are the nearest English vowel sounds. The sound of Swedish <b>d</b> is also sometimes indicated by <b>ē</b> , sometimes by <b>ā</b> or <b>d</b> .	<b>th</b>	" " <i>thrust, thin</i> .
<b>ē</b>	" " <i>fern, her, and as i in sir</i> . Also for <b>ē, oe</b> , in German, as in <i>Göthe, Goethe, Ortel, Oertel</i> , and for <i>eu</i> and <i>oeu</i> in French, as in <i>Neufchâtel, Crèvecœur</i> ; to which it is the nearest English vowel sound.	<b>th</b>	" " <i>then, this</i> .
<b>e</b>	" " <i>agency, judgment, where it is of a neutral or obscure quality</i> .	<b>zh</b>	" <i>z</i> in <i>azure</i> , and <i>s</i> in <i>pleasure</i> .
<b>i</b>	" " <i>ice, quiet</i> .	An apostrophe ['] is sometimes used to denote a glide or neutral connecting vowel, as in <i>tā'b'l</i> (table), <i>kāz'm</i> (chasm).	
<b>i</b>	" " <i>quiescent</i> .	Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.	
<b>i</b>	" " <i>ill, fit</i> .	When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English and other words which are correctly accented. Pronunciation is discussed fully in THE NEW INTERNATIONAL ENCYCLOPÆDIA and in the NEW STANDARD DICTIONARY.	
<b>ō</b>	" " <i>old, sober</i> .		
<b>ō</b>	" " <i>obey, sobriety</i> .		
<b>ō</b>	" " <i>orb, nor</i> .		
<b>ō</b>	" " <i>odd, forest, not</i> .		
<b>o</b>	" " <i>atom, carol, where it has a neutral or obscure quality</i> .		
<b>oi</b>	" " <i>oil, boil, and for eu in German, as in Feuerbach</i> .		
<b>ou</b>	" " <i>food, fool, and as u in rude, rule</i> .		
<b>ou</b>	" " <i>house, mouse</i> .		
<b>ū</b>	" " <i>use, mule</i> .		
<b>ū</b>	" " <i>unite</i> .		
<b>ū</b>	" " <i>cut, but</i> .		
<b>ū</b>	" " <i>full, put, or as oo in foot, book</i> . Also for <b>ū</b> in German, as in <i>München, Müller</i> , and <b>u</b> in French, as in <i>Buchez, Budé</i> ; to which it is the nearest English vowel sound.		
<b>ū</b>	" " <i>urn, burn</i> .		
<b>y</b>	" " <i>yet, yield</i> .		
<b>h</b>	" " the Spanish <i>Habana, Córdoba</i> , where it is like a <i>v</i> made with the lips alone, instead of with the teeth and lips.		
<b>ch</b>	" " <i>chair, cheese</i> .		

# THE NEW INTERNATIONAL YEAR BOOK

**ABBEY, EDWIN A., MEMORIAL.** See PAINTING.

**ABKHAZ AUTONOMOUS REPUBLIC.** See TRANSCAUCASIAN SOCIALIST FEDERATED SOVIET REPUBLIC.

**ABORTION IN LIVESTOCK.** See LIVESTOCK; VETERINARY MEDICINE.

**ABYSSINIA.** See ETHIOPIA.

**ACADEMIES IN SOUTH AMERICA.** See SPANISH-AMERICAN LITERATURE.

**ACADEMY, FRENCH (ACADÉMIE FRANÇAISE).** The oldest of the five academies which make up the Institute of France and officially considered the highest; founded in 1635, reorganized in 1816. The membership is limited to 40. The list of the Immortals at the beginning of 1931, in order of their election, was as follows: Paul Bourget; Gabriel Hanotaux; Henri Lavedan; René Bazin; Maurice Donnay; Raymond Poincaré; Eugène Brieux; René Doumic; Marcel Prévost; Henri de Régnier; le maréchal Louis Lyautey; Pierre de la Gorce; Henri Bergson; le maréchal Joseph Joffre (q.v.); Louis Barthou; Mgr. Alfred Baudrillart; Jules Cambon; Henry Bordeaux; Joseph Bédier; André Chevrillon; Pierre de Nolhac; Georges Goyau; Henri Brémond; Edouard Estaunié; Henri Robert; Camille Jullian; Georges Lecomte; Emile Picard; Albert Besnard; Louis Bertrand; Auguste de Caumont, duc de la Force; Paul Valéry; Abel Hermant; Émile Mâle; Louis Madelin; Maurice Paléologue; le maréchal Henri Pétain; André Chaumeix; and Charles le Goffic.

At the meeting of the academy on June 11, 1931, the chairs formerly occupied by the late Marshal Joffre and Georges de Porto-Riche were filled by the elections of Gen. Max Weygand and Pierre Benoit. General Weygand, vice president of the *Conseil Supérieur de la Guerre*, was one of the leading Allied commanders during the World War. On the outbreak of the war he was appointed chief of general staff to Marshal Foch, and in August, 1916, was made a general of brigade. He won distinction during the Polish campaign against Russia in 1920, launching an effective offensive in the autumn that saved Warsaw from threatened capture by the Bolshevik army. In 1924 he became a member of the *Conseil Supérieur de la Guerre*, and also served from May to October of that year as high commissioner in Syria. On his return to Paris he was made commandant of the *Centre des Hautes Études Militaires*, and in January, 1930, was appointed French chief of staff. Pierre Benoit, the novelist, gained renown after the World War

through such works as *Königsmark*, *Pour don Carlos*, *Le Lac Salé*, and *La Chaussée des géants*, in which critics found a romantic strain to induce forgetfulness of the sorrows of the war. *L'Atlantide*, published in 1919, received the academy's *grand prix du roman*. His other works include: *Les suppliantes*; *L'Oublié*; *Mademoiselle de la Ferté*; *La Châtelaine du Liban*; *Les puits de Jacob*; *Le roi lépreux*; and *Azelle*.

**ACADEMY OF ARTS AND LETTERS, AMERICAN.** A society founded in 1904 by members of the National Institute of Arts and Letters, its charter of incorporation being approved by Act of Congress Apr. 17, 1916. It corresponds to the French Academy, its membership being limited to 50 chairs, and vacancies caused by death are filled by election by the members from the National Institute on the basis of lifetime achievement in literature, painting, sculpture, architecture, and music.

The membership of the academy as of Nov. 12, 1931, consisted of the following in the order of their election: Robert Underwood Johnson, Henry van Dyke, Edwin Howland Blashfield, George de Forest Brush, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Owen Wister, Herbert Adams, Augustus Thomas, Cass Gilbert, Robert Grant, Frederick MacMonnies, William Gillette, Paul Elmer More, Gari Melchers, Elihu Root, Brand Whitlock, Hamlin Garland, Paul Shorey, Charles Adams Platt, Archer Milton Huntington, Child Hassam, David Jayne Hill, Lorado Taft, Newton Booth Tarkington, Charles Dana Gibson, John Charles Van Dyke, Royal Cortissoz, Henry Hadley, Charles Downer Hazen, George Pierce Baker, Wilbur L. Cross, Herman A. MacNeil, John Russell Pope, Edwin Arlington Robinson, James Earle Fraser, John Huston Finley, William Mitchell Kendall, Edwin Markham, Robert Frost, Irving Babbitt, James Truslow Adams, Edith Wharton, and George Grey Barnard.

At the annual meeting on Nov. 12, 1931, the following new members were elected: Gamaliel Bradford, Charles Martin Loeffler, William Lyon Phelps, and Adolph Alexander Weinman. Ignace Jan Paderewski, the Polish pianist and statesman, was elected a corresponding member. The academy's gold medal for good diction over the radio was awarded to John Holbrook of the New York division of the National Broadcasting Company, being presented to Mr. Holbrook by Hamlin Garland. In the afternoon there was opened in the art gallery of the academy an exhibition of the works of Paul Wayland Bart-

lett, the sculptor, who was a member of the academy, and in the evening the fifth concert of all American music was held in the auditorium.

The officers of the academy in 1931 were: President, Nicholas Murray Butler; chancellor and treasurer, Wilbur L. Cross; secretary, Robert Underwood Johnson; directors, Herbert Adams, Royal Cortissoz, Hamlin Garland, Robert Grant, Cass Gilbert, Archer Milton Huntington. Administrative offices are at 633 West 115 Street, New York City.

**ACCIDENTS.** See RAILWAY ACCIDENTS; WORKMEN'S COMPENSATION.

**ACHESON, EDWARD GOODRICH.** An American chemist and inventor, died in New York City, July 6, 1931. He was born in Washington, Pa., Mar. 9, 1856, and received an elementary school education. In 1880 he became assistant draftsman in the laboratories of Thomas A. Edison at Menlo Park, N. J., where he took part in the development of the incandescent lamp and later installed the first electric-lighting systems in different European cities. His inventions, derived in large measure from the electric furnace, include the widely used abrasive, carborundum, a carbide of silicon, manufactured by the Carborundum Company of Niagara Falls, N. Y., and Acheson graphite, an artificial product that far surpassed the natural one in purity and industrial usefulness, manufactured by the International Graphite Company, also of Niagara Falls. In 1906-07 he succeeded in "deflocculating" or reducing graphite to an exceedingly fine, non-coalescing state, the lubricants made from it with grease, oil, or water being respectively called "Gredag," "Oildag," and "Aquadag." He also invented a method of manufacturing silicon by heating silica (sand) with coke in an electric furnace, and of treating clay to increase its plasticity (Egyptianized clay). He was a recipient of the Rumford Medal of the American Academy of Arts and Sciences, the Perkin Medal, and the John Scott Medal of the Franklin Institute. In 1909 the University of Pittsburgh conferred upon him the honorary degree of Doctor of Science, and in 1914, having been elected an honorary member of the Swedish Technological Society, he was made an officer of the Royal Order of the Polar Star of Sweden. He donated \$25,000 in 1928 to the American Electrochemical Society (of which he was a past president) to establish the Edward Goodrich Acheson prize. This prize was to be awarded biennially to the person contributing most to the advancement of the objects of the society.

**ACHESON MEDAL.** See CHEMISTRY, INDUSTRIAL.

**ADAMS, EDWARD DEAN.** An American banker, died in New York City May 20, 1931. He was born in Boston, Mass., Apr. 9, 1846. Following his graduation from Norwich University in 1864, he entered the banking house of Richardson, Hill & Co., Boston, becoming a partner in 1870. In 1878 he removed to New York City, where until 1893, he was a member of the firm of Winslow, Lanier & Co., bankers. He then became American representative of the Deutsche Bank, Berlin, in which capacity he acted until the outbreak of the World War. He was one of the first bankers to be interested in the development of hydro-electric power and from 1890 to 1899, was president of the Cataract Construction Company, and allied companies at Niagara Falls.

He was engaged in the organization and reorganization of numerous railroad companies, including the Central Railroad of New Jersey, the New York, Ontario & Western Railway, and the Northern Pacific Railway, and was chairman of the board, president, or director, at different periods, of more than 40 corporations engaged in engineering enterprises. Among the honors bestowed on him were Royal Order of the Crown of Prussia (second class, 1909); Médaille de la Reconnaissance Française (1921), in recognition of his services as a director of the American Committee for Devastated France; and the John Fritz Gold Medal (1926).

**ADISON'S DISEASE.** See MEDICINE, PROGRESS OF.

**ADELBERT COLLEGE.** The men's college of liberal arts and sciences at Western Reserve University (q.v.).

**ADELPHI COLLEGE.** A nonsectarian college of arts and sciences for women in Garden City, N. Y., incorporated in 1896. Adelphi was located in Brooklyn, N. Y., until the autumn of 1929 when it was transferred to its new home in Garden City, where it has a campus of about 70 acres and three buildings. The enrollment for the autumn term of 1931 was 524 students. The faculty numbered 48. The endowment was \$891,165, while the income for 1930-31 was \$250,020. The library contained 30,135 volumes. President, Frank Dickinson Blodgett, LL.D.

**ADEN, a'den or a'den.** An important, fortified coaling-station and transshipment point on the water route to the East, situated on a volcanic peninsula on the southwestern coast of Arabia about 100 miles east of the Strait of Bah-el-Mandeb; belonging to Great Britain since 1839. The area of the peninsula is 75 square miles and that of Aden protectorate, including the hinterland, the peninsula of Little Aden, and the island of Perim, 9000 square miles. Population of Aden and Perim in 1921, 54,923, largely Mohammedan.

The chief commercial centre of the Arabian peninsula, Aden's total imports of merchandise commodities in 1930-31 amounted to 54,648,000 rupees (about \$19,728,000 at par), compared with 69,099,000 rupees (\$25,013,000) in 1929-30. Exports aggregated 37,059,000 rupees (about \$13,378,000), as against 51,470,000 rupees (about \$18,632,000) in 1929-30. Cotton piece goods, grain, hides and skins, tobacco, coal, and provisions are the principal commodities of trade. Salt and cigarettes are manufactured locally. Merchant vessels entering the port of Aden in 1930-31 numbered 1577 of 5,805,530 net tons. Entrances at Perim numbered 556. In 1928-29, the gross revenue of the Aden settlement was 775,808 rupees (about \$283,100).

Attached to Aden are the Kuria Muria Islands, ceded by the Sultan of Muscat for use as a landing for the Red Sea cable. On Aug. 15, 1929, control of the military government was transferred from the Viceroy of India to the Resident and Commander-in-Chief at Aden. Internal administration remained in the hands of the government of India. Resident and Commander-in-Chief in 1931, Lieut.-Col. B. R. Reilly, appointed March, 1931.

**ADULT EDUCATION, AMERICAN ASSOCIATION FOR.** An organization founded in 1926 to serve as a national clearing house of information concerning adult education activities. The association is not an operating organization; it has no programme of instruction; it employs no teachers; it administers no teaching enterprise. Its main effort is directed toward supplying a medium of exchange for teachers and administrators who are in direct contact with adults and their demands. The association seeks, also, to publish and to assist in the publication of material useful to those who are working in the field of adult education, and to conduct studies of problems fundamental to adult education. Among the agencies which are actively promoting adult education, and with which the association is in close contact are the following: The public schools; libraries; museums; extension services of departments of the Federal government and of colleges, universities, and professional schools; corporation schools; workers' schools and classes; fraternal and religious associations; child-study and parent-education groups; and almost an infinite variety of clubs and other organizations.

During 1931 the American Association for Adult Education concentrated much of its attention upon the problems growing out of the economic depression and the consequent widespread unemployment. In December, 1930, the association invited a group of educators and other persons particularly interested in educational problems to attend a conference on unemployment held in New York City. In preparation for the conference several well-known economists were asked to submit papers, stating their views as to the magnitude and character of the unemployment problem. These papers, together with a transcript of the discussions that took place at the meeting, were published by the association under the title, *Unemployment and Adult Education*, edited by Morse A. Cartwright. The association also conducted a study of programmes of training and education for workers at their jobs and for their jobs. A comprehensive report, written by Nathaniel Peffer who made the study, was to be published by the association. Other forthcoming publications included results of a study of university correspondence courses, and an analysis and appraisal of adult education activities in rural districts and small towns.

The National Advisory Council on Radio in Education, which was established as a result of an investigation of educational broadcasting made for the association in 1930, held its first annual assembly in New York City in May, 1931. Upon that occasion the first of a series of radio lectures, entitled "Men of America," was delivered under the auspices of the National Advisory Council. Series of radio lectures upon economics and upon psychology were also sponsored by the council. The sixth annual meeting of the American Association for Adult Education was held in May, 1931, at the New School for Social Research, New York City. The following officers were elected for one year: President, Felix Warburg; vice presidents, Ethel Richardson Allen, L. D. Coffman, Dorothy Canfield Fisher, C. H. Judd, Everett Dean Martin; chairman, James E. Russell; secretary, Margaret E. Burton; treasurer, Chauncey J. Hamlin.

Headquarters are at 60 East Forty-second Street, New York City. See **LIBRARY PROGRESS.**

**ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE.** This organization was founded in 1848 to advance science, to give a stronger and more general impulse and more systematic direction to scientific research, and to procure for the labors of scientific men increased facilities and a wider usefulness. In 1931 its membership included more than 19,800 individuals interested in the advancement of science and the progress of knowledge and education. There were also 132 autonomous and independent associated scientific societies, of which 98 were officially affiliated with the association, 26 being local academies of science. The association has 15 sections representing the main current subdivisions of science: Mathematics, physics, chemistry, astronomy, geology and geography, zoological sciences, botanical sciences, anthropology, psychology, social and economic sciences, historical and philological sciences, engineering, medical sciences, agriculture, and education.

The eighty-ninth (annual) meeting of the association was held in New Orleans, La., Dec. 28, 1931, to Jan. 2, 1932, with an attendance of about 2500 scientists from all parts of the United States and Canada. There also were 35 scientific organizations meeting with the association. At the meetings of its sections more than 1300 papers and addresses were presented by speakers. The science exhibition also was well developed, with exhibits by commercial firms, individuals, and scientific organizations. One of the most important demonstrations was that of the cosmic ray, which Dr. Robert A. Millikan, director of the Norman Bridge Physical Laboratory of the California Institute of Technology, regards as proof of a "creative" evolution of the universe.

The annual prize of \$1000 for the paper read at the annual meeting describing "a noteworthy contribution to science" was awarded to Dr. Carl Caskey Speidel of the University of Virginia, who had established through his researches the "out-growth" theory of nerves as opposed to the "chain" theory. This theory proved once and for all that the nerves do not grow as a result of cells forming a chain but that each nerve grows out of a single cell in a central nervous system. A tribute also was paid to Thomas Alva Edison as scientist and inventor at a special memorial meeting.

Since a majority of its associated societies hold regular summer meetings of their own, the association inaugurated in 1931 a new plan of national summer meetings. The first meeting was held in Pasadena and Los Angeles, Calif., June 15-20, the institutional hosts being the California Institute of Technology, the Mount Wilson Observatory of the Carnegie Institution of Washington, and the Huntington Library and Art Gallery. The presidential address on "Race and Progress" was delivered by Dr. Franz Boas, who assumed office at the opening session. The summer meeting in 1932 was to be held in Syracuse, N. Y., June 20-25, and the winter meeting in Atlantic City, N. J., December 27-31.

The official organ of the association is a weekly journal, *Science*. In addition, the association issues the *Scientific Monthly*, an illustrated magazine of timely articles of general interest by eminent men of science, and publishes at four-year intervals a volume of *Summarized Pro-*

ceedings, including a directory of members. The permanent endowment of the association, the income from which is employed to advance scientific research, amounted on Sept. 30, 1931, to \$168,326; grants are made annually to individuals or scientific organizations to promote research. Two regional divisions are under the auspices of the association: The Pacific division, including the Pacific States, Alaska, and the Hawaiian Islands; and the Southwestern division, including Arizona, New Mexico, Colorado, western Texas, and northern Mexico. These divisions are autonomous, holding annual and other meetings and engaging in special projects in their respective fields.

The president of the association in 1931 was Franz Boas, professor of anthropology at Columbia University. The president-elect for 1932 was John J. Abel, professor of pharmacology at the Johns Hopkins University. The other officers who were to serve until 1932 were: Permanent secretary, Charles F. Roos; general secretary, Burton E. Livingston; and treasurer, John L. Wirt. Headquarters are in the Smithsonian Institution Building, Washington, D. C.

**ADVENT CHRISTIAN CHURCH.** See ADVENTISTS.

**ADVENTISTS.** The Advent Movement had its origin in America with William Miller, who believed not only in the coming of Christ in person, power, and glory, but that such an advent was at hand and that the date might be fixed with some definiteness. The movement, however, began in England and on the Continent, under the leadership of the Rev. Hugh McNeile and the Rev. Edward Irving, in England, and the Rev. Joseph Wolfe, D.D., LL.D., in Prussia. A Prophetic Conference was held in Albury Park in 1836, at the residence of Henry Drummond, Esq., afterwards a member of the British Parliament, with "eight days of serious study of the prophecies," at which the Rev. Hugh McNeile presided. The first general gathering in America of those interested took place in Boston in October, 1840, the movement at that time being wholly within the existing churches, but in April, 1845, a conference was held in Albany, N. Y., at which the adherents of the Adventist doctrine were organized and a declaration of principles adopted, embodying the views of Mr. Miller. For the next ten years this organization included practically all the Adventists, but gradually separate bodies developed, beginning with the Advent Christian Church, in 1855, and including the Seventh-Day Adventists, organized in 1860; Life and Advent Union, in 1864; The Church of God (Adventists), in 1866; and The Churches of God and Christ Jesus, in 1888.

**ADVENT CHRISTIAN CHURCH.** This church which is congregational in church government holds simply to the general imminence of Christ's return but takes the position that the day cannot be determined. Statistics reported for 1931, covering 43 conferences, showed 469 churches, 485 ordained ministers, 81 licensed ministers, 27,940 church members, 332 Sunday schools, 19,102 Sunday-school members. 93 Senior Young People's Societies of Loyal Workers, with 2181 members, and 19 Junior Young People's Societies with 325 members. The denomination maintains three publication societies and two educational institutions: Aurora College in Aurora, Ill., and the New England School of Theology in Boston. Periodicals published include *The World's Crisis*

(Boston), *Messiah's Advocate* (Oakland, Calif.), and *Present Truth Messenger* (Live Oak, Fla.). Among the philanthropic institutions of the denomination are the American Advent Christian Home and Orphanage in Dowling Park, Fla., and the Vernon Home for ministers and missionaries in South Vernon, Mass. The biennial general conference of the Advent Christian Church was held in Aurora, Ill., June 12-17, 1930. The officers in 1931 were Irving F. Barnes, D.D., president; C. O. Farnham, D.D., T. P. Stephens, Burr A. L. Bixler, Lee E. Baker, vice presidents; C. H. Hewitt, secretary; F. C. Webster, treasurer.

**SEVENTH-DAY ADVENTISTS.** This denomination, which is the largest of the Adventist group, embraces 12 union conferences in the United States and Canada. It believes that the seventh day of the week, from sunset on Friday to sunset on Saturday, is the Sabbath established by God's law and that immersion is the only proper form of baptism. The local church is congregational in government, although under the general supervision of the conference. The statistical report of the denomination for 1930 indicated 2227 churches in the North American division, 935 ordained ministers, and 120,560 church members; Sabbath schools numbered 2759 and the membership, 124,581. The foreign divisions, including the African, Australasian, Central European, Far Eastern, Inter-American, Northern European, South American, Southern Asia, Southern European, and Union of Socialist Soviet Republics divisions, consisted of 4514 churches, 1127 ordained ministers, 193,693 church members, and 7207 Sabbath schools, with an enrollment of 258,162. Throughout the world there was an increase in membership of 14,698 over 1929; the work was conducted in 141 countries by 71 union-conference, 160 local-conference, and 270 mission-field organizations, employing 21,461 evangelistic and institutional laborers. The movement maintains in the United States and Canada 107 educational institutions, which in 1930 had an enrollment of 17,759 students. There are also 94 educational institutions maintained in foreign countries, with an enrollment of 13,971 students. The denomination has 19 publishing houses in North America and 48 in other countries. During 1930 denominational literature was issued in 146 languages, and evangelistic work was conducted in 141 countries, total contributions from all sources for this work amounting to \$8,144,449 for the North American division and to \$3,968,160 for the other divisions. The headquarters of the General Conference of Seventh-Day Adventists are at Takoma Park, Washington, D. C.

**AERONAUTICS.** With other fields of engineering at a standstill or seriously handicapped by economic conditions, it was encouraging and interesting to note that in almost all branches of aeronautics progress was to be recorded. There was an extension of existing transportation routes in all quarters of the world and in general increased patronage or at least indications that there would be a considerable gain when conditions were once more normal. In Europe, government subsidies were granted to transportation routes to stimulate their development and operation, and everywhere the manufacture of aircraft was considered on a more wholesome basis. Many firms suddenly developed and with inadequate resources and technical skill were forced to yield to better organized concerns.

THE U. S. S. "AKRON" IN FLIGHT

SIKORSKY AMPHIBIAN AIRPLANE "AMERICAN CLIPPER"

Pan American Airways System

The *Graf Zeppelin* continued its activity while a new and larger airship built at Akron, O., for the U. S. Navy was put in commission, a fact that indicated that the American Navy still had confidence in this type of craft. Competitions of one kind or other led to improved airplanes and it was noteworthy that the speedy and powerful planes as developed in competition, either found their way into military service or influenced military design. Larger aircraft with increased comfort, speed, and capacity were placed in service and air travel in all parts of the earth made progress and was more and more appreciated. Such comparatively novel developments as the autogiro made trips across the American continent while instrumental equipment of one kind or another applied to aircraft made flying safer and speedier.

**WORLD ALTITUDE RECORD.** The world's altitude record for a balloon ascent, made on June 30, 1921 by Suring and Berson of Germany of 10,800 meters (35,424 feet), was broken on May 27 by Professor Piccard of Brussels University who, starting from Augsburg, Germany in a balloon, reached a height of 15,781 meters (51,775 feet) or nearly 10 miles. The balloon used had a diameter of 30 meters (98.425 feet) and a capacity of 14,000 cubic meters (494,400 cubic feet) but only about one-seventh of the envelope was inflated as provision was made for expansion to compensate for the decreased atmospheric pressure during the ascent. Professor Piccard and an assistant, Paul Kipfer, were in a hermetically sealed aluminum sphere, in place of the customary wicker car, with a lid screwed on tightly from within. Several small windows of thick glass were provided. Before the start from Augsburg, the sphere, in which the two aeronauts were seated, was knocked from its temporary support and, as a result of the jar, a slight crack developed. This was stopped with cotton

last had it not been for the malfunctioning of the defective valve. The balloon was in the air from early in the morning till 8 o'clock in the evening when a descent was made above Ober-gurgl in the Oetzwald Tirol and a landing was made on Gross Gurgl Ferner where a group of peasants climbed the mountain and brought the two aeronauts down. Professor Piccard regretted that the accident had prevented as much scientific observation as had been planned and that the results were not as encouraging as were anticipated. The aeronauts were able to see the moon under unusual conditions, it appearing brilliant even at noontime, and they ascertained the greater intensity of the cosmic rays in the upper atmosphere as compared with those on the earth's surface. Considerable data, however, were accumulated for systematic examination. At the highest altitude it was stated that a temperature of 67° to 76° Fahrenheit below zero or 100 degrees of frost was recorded.

**NATIONAL BALLOON RACES.** The National Balloon competition carrying with it the Paul W. Litchfield Trophy and the privilege of entering the International Balloon Race, was started at Akron, Ohio on July 19 with six competitors. It was won by Lieut. T. G. W. Settle, U. S. N. the chief inspector on the construction of the *U. S. S. Akron*, who had flown previously in competitions of this kind. The race was interfered with by rain and thunderstorms, and natural gas with far less lifting power than hydrogen was used. The distance flown by the winner, 195 miles, may be compared with the 768 miles of Roland J. Blair made in the 1930 competition. The official check by the National Aéronautic Association of the logs of pilots in the National Balloon Race, with the distances scaled by the U. S. Geological Survey from data given on the landing certificates submitted by each pilot, indicated the following results:

Place	Entrant	Pilot and aide	Place of landing	Distance
1.	U. S. Navy	T. G. W. Settle Wilfred Bushnell	18 mi. ESE of Buffalo, N. Y. 6 mi. NNE of E. Aurora, N. Y. 7 mi. SW of Alden, N. Y.	195 mi.
2.	Goodyear Zeppelin Corp.	F. A. Trotter R. J. Blair	9 1/4 mi. NW of Buffalo, N. Y. 11 1/2 mi. E of Welland, Ohio 3 1/2 mi. NE of Stevensville, Ont.	185 mi.
3.	Detroit Balloon Club	E. J. Hill A. G. Schlosser	8 mi. E of Erie, Pa. 8 mi. E of Westleyville, Pa.	110 mi.
4.	U. S. Army	K. S. Axtater H. H. Couch	1 mi. E of Custards, Pa. 10 mi. S of Meadville, Pa. 5 mi. W of Cochranston, Pa.	80 mi.
5.	Goodyear Zeppelin Corp.	L. P. Furcolow J. B. Rieker	4 mi. N of Ravenna, Ohio 5 mi. S of Mantua, Ohio 10 mi. NE of Kent, Ohio	18 mi.
6.	U. S. Army	F. M. Fogelsonger John A. Tarro	2 1/2 mi. NE of Brimfield, Ohio	11 mi.

waste and vaseline but required constant attention during the flight. A serious effect of this accident was to cause a leakage in the reserve supply of oxygen, which was only stopped after a certain quantity of the gas had been lost. The balloon in the first 25 minutes rose to a height of 15,000 meters (49,212.5 feet) but this caused an excessive vibration of the sphere and impaired the operation of the valve strings. It would have been possible to have reached an even greater height, say 17,000 meters, by throwing out bal-

**GORDON BENNETT BALLOON RACE.** In 1931 there was no contest for the Gordon Bennett Balloon Race, which ordinarily would have been held in the United States, as that country in 1930 was successful in this annual competition. The Contest Committee of the National Aéronautic Association decided to propose to the Fédération Aéronautique Internationale at the conference to be held Jan. 15, 1932, that the 1932 Gordon Bennett Balloon Race should be held in Europe in place of the United States.

planes was a Rolls-Royce R which had been developed from that design in 1929 and which enabled the Supermarine S6 to achieve a world's speed record of 357 miles per hour. Two types were developed, one employed in the Schneider race developing 2300 h.p. per hour, and the other, the so-called "Sprint" engine for the high speed record, developing 2600 h.p. These engines were developed during the year so that they would realize the designer's plan to run at full throttle for at least an hour. From a test run of 20 minutes at the end of April, by the middle of July these machines were improved so that 30 minutes without a breakdown was accomplished and finally on August 12, an hour's run was accomplished.

It was reported during the year that Italy was manifesting considerable interest in high speed planes and that work was being done on the development of a plane which would fly at a speed of 450 miles per hour. Flight Lieutenant Bellini who perished in a crash on Lake Garda on September 10 was reported to have made a speed of 453 miles per hour and would have been a competitor in the Schneider competition had he survived.

The accompanying table from *Aviation*, New York, November, 1931, gives the comparative specifications of five speed planes that made notable records in the United States and Great Britain during the year.

Plane and engine	Span (ft.-in.)	Chord (in.)	Length (ft.-in.)	Weight empty (lb.)	Gross weight (lb.)	Wing loading (lb. per sq. ft.)	Power loading (lb. per h.p.)	High speed *	Wing area (sq. ft.)
Gee Bee, Wasp Junior, 535 h.p. ....	23-6	50.4	15-1	1,400	2,280	30.20	4.26	269.	75
Laird, Wasp Junior, 535 h.p. ....	21-0	42.0	19-6	1,580	2,482	22.16	4.68	258.	112
San Franciscan, Menasco, 260 h.p. ....	21-4	60.0	16-6	800	942	14.50	3.60	200.	65
Wedell-Williams, Wasp Junior, 535 h.p.	26-0	60.0	21-0					255.	
S.6B, Rolls-Royce R, 2,300 h.p. ....	30-0	68.0	27-9	4,030	5,995	41.30	2.60	408.8	145

\* Approximate in some cases. Estimated from best data available.

**WORLD'S SPEED RECORD.** After the Schneider Race in Great Britain, Flight Lieut. G. H. Stainforth, R. N., on September 29, in flying over the 3-kilometer course at Calshot made an average speed of 408.8 miles per hour in four flights, one lap being covered at 415.2 miles per hour with a light wind. The record as accepted by the Federation Aéronautique Internationale, 655 kilometers (406.997 miles), was achieved in one of the planes, a S.6B Supermarine plane, previously built for the Schneider Races and equipped with a special Rolls-Royce engine which developed 2600 h.p. or about 300 h.p. more than was possible in the engines used in the Schneider competition. The machine was supplied with a Fairey-Reed propeller, and a refined fuel containing both tetra-ethyl lead and a high percentage of wood alcohol was employed. After this performance it was thought likely that there would be few, if any, future contests of this nature, as the Schneider competition had apparently outlived its usefulness, though the various events had marked the development of high speed and reliable engines and planes.

Attempts to beat the world landplane speed record of Bonnett of France (Dec. 11, 1924) of 278.48 m.p.h. were made during 1931 but without success. Lowell R. Bayles, who had made a notable flight at the National Air Races at Cleveland, on December 1 flew at Detroit and at first it was thought that he had made a record

of 301.2 m.p.h. in four flights over a 1.8 mile course, but a recheck of his flying time gave but 281.75, m.p.h. lacking a mile and a half of the mileage necessary to secure the recognition of the Federation Aéronautique Internationale. In his next attempt on December 5 he was killed in a crash while flying at low altitude at a speed estimated at about 300 m.p.h.

**ENDURANCE RECORD.** The Diesel engine first applied to an airplane in 1928 scored a notable achievement during the year when the duration record for airplane flight in closed circuit was made in a Bellanca monoplane powered by a Packard Diesel, 225 h.p. engine. This duration record, 84 hours, 32 minutes, was made by Walter E. Lees, and F. A. Brossy at Jacksonville Beach, Florida, May 25 to 28, 1931. This was the longest flight ever made without refueling and demonstrated the efficiency of the Diesel motor and its future application for commercial flight. Here was demonstrated not only reliability of power plant but also its aerodynamic efficiency and fuel economy.

The most notable long distance flight of the year was that of Wiley Post and Harold Gatty, pilot and navigator respectively, of the Lockheed-Vega monoplane, the *Winnie Mae* of Oklahoma, who flew around the world, a distance of 15,474 miles in 8 days, 15 hours, and 51 minutes. This flight was begun at Roosevelt Field, New York, on June 24 and was completed on July 10. The

first stage was to Harbor Grace, a distance of 1132 miles. The remaining thirteen stages into which the journey was divided were as follows:

Harbor Grace to Chester .....	2,195
Chester to Hanover .....	534
Hanover to Berlin .....	154
Berlin to Moscow .....	991
Moscow to Novo-Sibirsk .....	1,579
Novo-Sibirsk to Irkutsk .....	1,055
Irkutsk to Blagovestchensk .....	1,009
Blagovestchensk to Khabarovsk .....	361
Khabarovsk to Solomon Beach .....	2,500
Solomon Beach to Fairbanks .....	520
Fairbanks to Edmonton .....	1,450
Edmonton to Cleveland .....	1,600
Cleveland to New York .....	394

The flying time was 107 hours and 2 minutes or 146 miles per hour, the total elapsed time for the journey was 207 hours and 51 minutes. This was 13 days shorter than the trip of the *Graf Zeppelin* and 15 days less than the previous airplane record of Mears and Collyer who shipped their plane across the Atlantic and Pacific Oceans. The importance of the performance may be realized when it is recalled that the first trip around the earth by air was made by U. S. Army planes in 1924 (See YEAR BOOK for 1924) and required 175 days or 14 days, 15 hours of flying time. The *Winnie Mae* was powered by a 525-horse power Pratt & Whitney Wasp engine and was completely equipped for this trip which

was made with no extraordinary preparations. The plane itself weighed more than 3 tons with equipment and the two aviators.

The non-stop distance record was broken in a notable flight made by Russell Boardman and John Polando who flew, on July 28, from Floyd Bennett Airport, N. Y., arriving at Istanbul (Constantinople), Turkey, in 49 hours and 19 minutes, a distance of 5012 miles. This record was accepted officially by the Federation Aéronautique Internationale and supplanted the non-stop record of Dieudonne Coste and Maurice Bellonte made in September, 1929, from Le Bourget, France, to Coulart, China, a distance of 7905.14 kilometers (4948.590 miles). Boardman and Polando flew in a Bellanca monoplane, the *Cape Cod*, powered with a 300-horse power Wright engine and weighing 7500 lbs. as it left the ground carrying 25 gallons of oil, and 728 gallons of gasoline, all of which was consumed.

In an attempt to break the Coste-Bellonte record, a non-stop flight of 6000 miles from Paris to Tokyo was planned by Marcel Doret and Joseph Le Brix. Due to engine failure during a storm their Dewoitine monoplane crashed in mid-Siberia about 700 miles east of Moscow and was almost completely destroyed. Le Brix and a companion, Rene Mesmin, were killed but Doret escaped by his parachute. Interest was attached to this flight because the monoplane had established on June 7-10, 1931 at Istres, France a new world record of 10,372.05 kilometers (6444.88 miles) for distance in a closed circuit without refueling. These aviators were in the air 70 hours and 10 minutes in an effort to break the world's non-refueling endurance flying record previously established by Lees and Brossy as noted elsewhere. Although failing in this, they were able to supplant the former closed circuit distance of 5564 miles made by Paillard and Mermoz.

**WOMEN'S RECORDS.** The year 1931 witnessed the establishing of several new and important feminine records. Mme. Maryse Bastie of France, who had achieved a world record for duration without refueling of 37 hrs. 55 min. in a flight at Le Bourget, Sept. 2, 3, 4, 1930, flying in a Klemm airplane with a Salmson 40-h.p. engine, succeeded in making an air line distance record for a light airplane of the third category of 2976.910 km (1849.763 mi.) in a flight from Le Bourget to Russia, June 28-29, 1931. A record for duration with refueling was made at Los Angeles, Calif., Jan. 4-9, 1931, by Miss Evelyn (Bobbie) Trout and Miss Edna May Cooper in a Curtiss-Robin monoplane with Challenger 170-h.p. engine. They remained in the air 123 hours. Miss Ruth Nichols in a Lockheed Vega monoplane with a Pratt and Whitney Wasp 420-h.p. engine at Jersey City Airport, N. J., Mar. 6, 1931, achieved an altitude record of 8761 meters (28,743 ft.). In the same plane at Carleton, Mich., Apr. 13, 1931, she also made a maximum speed record of 338.987 km. per hour (210.636 m.p.h.). In a similar plane Miss Amelia Earhart in the previous year had made a record accepted by the Federation Aéronautique Internationale. At Detroit, June 25, 1930, Miss Earhart made a record for 100 kilometers of 281.470 k.p.h. (174.897 m.p.h.), and on the same day, with a pay load of 500 kilograms, she made a record for 100 kilometers of 275.904 k.p.h. (171.438 m.p.h.). A record for altitude in a light plane in the third category also came to the United States when

Miss Mae Haizlip in a Buhl Bull Pup with a Szekely 85-h.p. engine at St. Clair, Mich., June 13, 1931 climbed to 5516 meters (18,097 ft.).

**SCHNEIDER TROPHY COMPETITION.** The Schneider Trophy Competition for 1931 did not arouse the usual interest in view of the fact that the French and the Italian teams were forced to withdraw on account of accidents they had suffered and the refusal of the British to consent to a postponement for six months. Two planes belonging to Great Britain flown by Flight Lieut. J. N. Boothman and by Flight Lieut. G. H. Stainforth achieved new and notable records and secured the Trophy permanently for Great Britain, whose aviators had won it twice in succession. Lieutenant Boothman flew a Supermarine S.6B seaplane seven times over the 50 kilometer (31.07 miles) course at Calshot, near the Isle of Wight, at an average speed of 340.08 miles per hour, which was more than 11 miles per hour faster than the speed achieved in 1929, when the competition was won by the late Lieut. H. R. B. Waghorn. In the first two laps of Lieutenant Boothman's flight a new record for 100 kilometers (62.1 miles) of 342.9 miles per hour was made in place of the previous record of 331.75 miles per hour. In a second plane of the same type, Lieut. G. H. Stainforth made a world's speed record over a 3-kilometer course, averaging 379.05 miles per hour for four laps, or more than 21 miles better than the record established by Squadron Leader A. H. Orlebar in 1929.

The Supermarine monoplanes were notable for the high-powered S.6B Rolls-Royce engines which differed in a few important improvements from those used in 1929. They produced 2300 h.p. or about 20 per cent more than the 1800 h.p. made by the earlier models. An improved water-cooling system occupied the entire upper and lower surface of the wings, and the upper surface of the floats, so that there was available sufficient radiator surface to permit the plane to be flown with the engine at full throttle. The planes were provided with larger floats thus affording a greater fuel capacity and so designed as to reduce air resistance and afford additional lift.

**NATIONAL AIR RACE MEETING.** The National Air Race Meeting of 1931 was held at Cleveland, O., August 29 to September 7. In addition to the events at the Cleveland Municipal Airport, a Transcontinental Handicap Air Derby from Santa Monica, Calif., to Cleveland, and a Transcontinental Free-for-all Speed Derby—the Bendix Trophy Race—from Los Angeles, Calif., to Cleveland, were flown. The former included a Women's Division in which first place and \$3000 was won by Phoebe Omlie in a Monocoupe plane with Warner engine. First place in the Men's Division, with a \$3000 cash prize, was won by D. C. Warren in a D. H. Moth plane with Gypsy engine. In the Bendix Trophy Race, Maj. James H. Doolittle took first prize and \$7500, flying in a Laird monoplane with Wasp engine and making the trip in 9 hours, 10 minutes, 21 seconds, or a speed of 223.038 m.p.h.

The most important event of the forty or more on the programme was the Men's Free-for-all Thompson Race of 100 miles or 10 laps over a 10-mile course. It was won by Lowell Bayles of Springfield, Mass., from a field of eight contestants and carried with it a \$7500 money prize. Bayles flew in a Gee Bee plane with Wasp Jr. motor and recorded 25 minutes, 23.88 seconds for

the 100 miles or a speed of 236.239 m.p.h. The Women's Free-for-all Cleveland Trophy Race of 50 miles or 5 laps over a 10-mile course was won by Maud Tait flying in a Gee Bee Y plane with a Wasp C engine and scoring 15 minutes, 59.62 seconds or 187.574 m.p.h. This carried with it a first prize of \$3750.

In connection with the Transcontinental Competition for the Bendix Trophy at the National Air Races, Maj. James H. Doolittle flew from Burbank, Calif., on September 4 in a Laird plane with Wasp Junior engine with supercharger and after landing at the Cleveland Airport to check in for the competition and to refuel, proceeded to the Newark, N. J., Airport, making a record flight of 2450 air miles in 11 hours, 16 minutes, and 10 seconds, which was 1 hour and nearly 9 minutes better than the record set by Capt. Frank Hawks in his notable flight of Aug. 13, 1930. Major Doolittle then returned to Cleveland and took part in the Thompson Trophy Race but was forced out on the seventh lap due to an overheated engine. On October 20, Major Doolittle flew from Ottawa to Mexico City, a distance of 2510 miles in 12 hours and 36 minutes with refueling stops at Washington, D. C., Birmingham, Ala., and Corpus Christi, Tex. His actual flying time was 11 hours and 45 minutes.

**NATIONAL AIR TOUR.** The National Air Tour for the Edsel B. Ford Reliability Trophy was flown from July 4 to July 25, starting from Detroit, and out of 20 entries, 14 planes competed and 10 finished, having covered 4838 miles. The winner of the 1930 Tour, Harry Russell, again won first place flying in a Ford Trimotor equipped with two Wright J-6 and one Wright Cyclone motors, with a total horse power of 1175. The gross weight of the plane was 13,000 lbs. and its empty weight, 7844 lbs., thus affording a useful load of 5156 lbs. The total points scored amounted to 63,764.3, and the average speed of the flight was 143.20 miles per hour, the average speed being computed on the laps scored in each case showing the actual average flying speed.

Second place was also taken by a Ford Trimotor piloted by J. A. Smart and equipped with three P. & W. Wasp engines of 1200 horse power, and having a gross weight of 13,500 lbs., and an empty weight of 7960 lbs., giving a useful load of 5540 lbs. The points scored were 53,813, and the average speed was 143.20 miles per hour. Third place was won by the Cessna plane piloted by Eddie Schneider, equipped with a Warner motor of 110 h.p., and having a gross weight of 2260 lbs., and weighing empty 1267 lbs., with a useful load of 993 lbs. The points scored by this plane totaled 44,343.7, and the average speed was 120.99 miles per hour.

The Great Lakes Trophy for light planes was also contested on this tour and was won by L. R. Bayles, flying a Granville Gee Bee plane and scoring an average speed of 141 miles per hour. His plane was equipped with a Warner motor of 110 h.p., and had a gross weight of 1400 lbs., and an empty weight of 912 lbs., giving a useful load of 488 lbs. The points scored by this plane were 44,106.3.

**NOTABLE FLIGHTS.** The year witnessed a number of unusual flights on the score of distance, speed, or over new or unexplored regions marked perhaps by fewer catastrophes to the aviators who were seeking records or to develop new routes. New routes and possible speed perform-

ances in future commercial flying were tested in some cases in addition to the power, efficiency, and reliability of equipment. Among the many notable achievements of the year the following may be referred to briefly.

Colonel and Mrs. Charles A. Lindbergh flying from Washington, D. C., on July 29 in a specially constructed Lockheed Sirius seaplane proceeded north and across northern Canada, Alaska, Bering Sea, along the east coast of Siberia and reached the northernmost islands of Japan in 86 hours of flying time for a flight of 7830 miles. They were forced to land off one of the remote islands of the Kuirile group on account of fog and a wet spark plug developed so that with the rough water it could not be cleaned until a sheltered place was reached. Colonel and Mrs. Lindbergh received aid from a Japanese vessel and were received in Tokyo on August 26. The death of Mrs. Lindbergh's father forced the interruption of their trip.

An interesting transatlantic flight was that of Otto Lillig and Holger Hoiris, who flew from Harbor Grace, Newfoundland, on June 24 landing at Krefeld, Germany, the following day; thence they proceeded to Copenhagen where they landed on June 26 and were received with enthusiasm by the Danes. They flew in a Bellanca monoplane.

On July 15, two Hungarian aviators, Capt. George Endres and Capt. Alex Maygar, flew from Harbor Grace, Newfoundland, in the Lockheed-Sirius monoplane *Justice for Hungary* and on the following day with fuel exhausted they were forced down within 25 miles of Budapest, their objective, a distance estimated at about 3240 miles.

In an attempt to beat the record of Post and Gatty, Clyde Pangborn and Hugh Herndon, Jr., in a Bellanca monoplane with a 425-horse power Wasp engine, flew across the Atlantic, leaving New York on July 28. Reaching Moscow on July 31 they made their way successfully across northern Europe and Siberia making several stops, but at Khabarovsk, Siberia were forced, by delays due to a damaged wing, to abandon their attempt at the record. They proceeded to Japan, however, and announced they would try for the \$25,000 prize offered by the Tokyo newspaper *Asahi* for a non-stop flight from Japan to the United States. Alleged lack of discretion as shown in taking photographs and flying over fortified areas without official permission, brought on a conflict with the Japanese government and the plane was seized and they were duly apprehended and fined, though the matter was later adjudged. On October 3 they left Samushiro Beach near Tokyo and on October 5 landed at Wenatchee, Wash., after a flight of 4458 miles in 41 hours 13 minutes.

The British aviator, J. A. Mollison, on July 29, flew from Wyndham, West Australia and arrived at Croydon, near London, on August 6, a distance of 10,000 miles in 8 days, 20 hours, and 19 minutes, beating by two days the record made by Flight Lieut. C. W. A. Scott whose time was 10 days and 25 hours. Mollison was delayed by thunder storms over Europe and fog over the English Channel, and it is interesting to compare his time with that of Post and Gatty who flew around the world, a distance of 5000 miles more, in 4 hours less time.

Captain Wolfgang von Gronau, a German aviator, who had crossed the Atlantic in 1930 in a twin-engine seaplane, in 1931 made another im-

portant transatlantic flight in the Dornier flying boat *Gruenland-Wal*, from Westerland, Germany, on August 8, to Chicago, U. S. A., by way of Iceland, Greenland, Labrador, and Canada in order to ascertain data for the establishment of mail routes through the sub-Arctic regions. Stops were made en route and Chicago was reached on September 1. This flight included the first crossing of Greenland and totaled nearly 4700 miles.

Another record flight of the year was from England to the Cape of Good Hope, 7800 miles (October 30 to November 5) in 4 days, 6 hours, 40 minutes, made by Miss Peggy Salaman and A. Gordon Store who, flying in the Puss Moth plane *Good Hope*, reduced the record for this journey by 25 hours and 23 minutes. The flight was helped by good weather and adequate preparations at the various aerodromes across Africa so that night flying was possible. The flying time was 64 hours as against 56 hours for Lieutenant Commander Glen Kidston in his trip in the previous April which took 154 hours for the 7000 miles.

One of the successful long distance trips of the year was across Siberia by Miss Amy Johnson of England, who, leaving London on July 28, landed at Tokyo on August 6, completing a trip which she had begun in January but was forced to discontinue through a forced landing near Warsaw. Flying time for this trip, which she accomplished from London via Berlin, Moscow, Irkutsk, Harbin (Manchuria), and Seoul (Korea), was about 78 hours and 50 minutes.

The record for flight from England to Australia then was reduced by about an hour by C. A. Butler, flying October 31–November 9, in a Comper-Swift light airplane with 75-h.p. Popjoy engine. The plane weighed 546 lbs. or 100 lbs. lighter and with 25 less horse power than any plane that had previously made this flight. Butler's record was 9 days, 2 hours, 29 minutes.

The British aviator, Squadron Leader Bert Hinkler made the first west-to-east flight across the Southern Atlantic Ocean and the first solo ocean crossing since Lindbergh, when he flew from Natal, Brazil, to Bathurst in Gambia on the west coast of Africa, November 26–27. This also was the first transatlantic flight in a light plane, his machine being a Toronto built De Haviland Puss Moth monoplane with a 120-h.p. Gypsy engine, which differed from standard models only in extra fuel tanks and navigating equipment. The 1931 ocean trip was made in 22 hours with 160 gallons of gasoline. It will be remembered that Hinkler set the record for the England–Australia flight at 15½ days in 1928. In this journey from New York to England he flew 10,500 miles mostly in over-water flights of 1000 miles and longer.

An American aviator, Capt. Frank M. Hawks, during the year made a unique series of record-breaking flights over America and Europe. He landed at Cherbourg, France, Apr. 5, 1931, with a plane which he immediately put into commission and flew to Paris, making the 210 miles in 56 minutes on April 6. On April 13, he flew from Brussels to Amsterdam, 72 miles in 24 minutes, returning on April 15 in 19 minutes. On April 22, he breakfasted in London and flew to Rome for luncheon making the trip of 950 miles in 5 hours and 24 minutes, or an average speed of 167 miles an hour. He returned to London in time for tea, making the round trip of 1900 miles in 9 hours

and 44 minutes, or an average speed of about 190 m.p.h. A trip from Paris to London on April 23, 218 miles, was made in 59 minutes or a speed of 220 m.p.h., and was followed a week later by flights to and in Ireland. On May 12, Captain Hawks flew from London to Berlin, a distance of about 600 miles, in 2 hours and 57 minutes, or an average speed of 204 m.p.h., and on May 27 he left Le Bourget Aerodrome at Paris at 8.20 A.M. and reached Croydon Airport near London in 1 hour and 15 minutes, flying the 218 miles at a rate of 173.6 m.p.h. After breakfast he flew to Berlin, about 600 miles, in 3 hours and 15 minutes where he lunched, and arrived at Paris, 568 miles, in time for dinner, making the trip at a rate of 188.1 m.p.h. The total elapsed time for this trip, approximately 1386 miles, was 9 hours and 51 minutes. Captain Hawks then made a series of equally notable trips around France and other European cities, and shipping his airplane by steamer returned to America by way of Canada. On July 3 he flew from Quebec to Montreal for breakfast, 160 miles, in 50 minutes and from Montreal to Toronto for luncheon in 1 hour and 45 minutes; from Toronto to Ottawa, for tea, 225 miles, in 1 hour and 6 minutes, and returned from Ottawa to Montreal, 115 miles, in 32 minutes, making 850 miles in the flying time of 4 hours and 18 minutes. On his return to New York, Captain Hawks flew the 350 miles in 1 hour and 45 minutes, thus making a new record.

On July 23, 1931, Captain Hawks after breakfast in New York flew to Havana for luncheon and returned in time for dinner in New York, making a new record on the trip down of 8 hours, 8 minutes and 30 seconds, and for the return, 7 hours and 31 minutes. The round trip, including an hour and 25 minutes for luncheon and four fuel stops, totaled 2806 miles, requiring 17 hours, 2 minutes, and 30 seconds. Flying from New York to Chicago on August 12, he made the journey in 4 hours and 6 minutes, breaking the record of a week previous of Captain Hall. Proceeding to South Dakota, he enjoyed the honor of being named Chief Flying Hawk by the Sioux Indians and returned on the following day to New York City, surpassing his Chicago to New York record by 20 minutes, and making the 1546 miles from Hot Springs, S. D., to Roosevelt Field in 8 hours, 48 minutes.

On August 26 Captain Hawks broke nine city-to-city records from Atlanta to New York, making the Richmond to Washington flight of 103 miles in 30 minutes; Washington to Philadelphia, 128 miles, in 44 minutes, and Philadelphia to Newark, 72 miles, in 21 minutes. This record was beaten late in the year by Lou Reichers, who flew from Newark to Havana with one passenger in 6 hours, 41 minutes flying time for a distance of 1400 miles. He flew a Lockheed Altair plane with retractable landing gear and a Cyclone engine.

Captain James G. Hall, a former U. S. Army aviator, on June 19 flew the 1300 miles from Vancouver, B. C. to Agua Caliente, Mexico in 7 hours and 48 minutes, beating by 1 hour and 26 minutes the previous record held by Col. Roscoe Turner. He used a Lockheed Altair plane with retractable landing gears. Captain Hall established a New York to New Orleans record, flying 1184 miles with a passenger in 7 hours and 14 minutes without a stop. Captain Hall also broke the New York to Havana record on July

18, covering the 1400 miles in 8 hours and 35 minutes without a stop. On August 5 he flew from Roosevelt Field, New York, to Chicago in 4 hours and 12 minutes.

**AIRWAYS IN THE UNITED STATES.** According to the Aeronautics Branch of the U. S. Department of Commerce, at the end of the year 1931 there were in operation 50,339 miles of airways, of which mail airways amounted to 43,735 miles. The total average of airplane-miles schedules was 107,705 miles with United States contract mail, and 40,673 for non-mail service, making a total of all services of 158,378 miles. The air mail carried was approximately 9,000,000 pounds, while some 450,000 passengers were carried, some 116,000,000 passenger miles being recorded, these figures showing an increase over 1930.

The number of air transport services in operation in the United States on Dec. 15, 1931 were as follows: Domestic routes, 111; mail, 66; passenger, 94; express, 63. Foreign routes, 17; mail, 15; passenger, 11; express, 7. All routes, 126; mail, 79; passenger, 103; express, 70.

During the year slightly more than 2000 miles of new U. S. Mail Routes were added to the schedules, in the main extensions to existing contracts, and the usual practice was for passenger accommodations to go with the mail service, thus working for a permanent basis for air transport on the mail routes. There was a further development of lower cost air transportation and this seemed to stimulate travel. A rate of 6 cents per mile, which had been made by some companies in 1930, had become the average on most lines in 1931, and had every evidence of continuing under existing conditions. In fact a reduction of the fare between New York and Los Angeles from \$200 to \$160 or 7.5 cents to 6 cents a mile was announced for 1932. All of the leading transportation companies introduced various improvements, such as automatic pilots, and communication devices, while terminal facilities were materially improved. The airports were developed at various centres though here again financial conditions made the rate of increase slower than it should have been under normal circumstances. On Dec. 31, 1931, there were 2075 airports and landing fields in the United States distributed as follows: Municipal airports, 656; commercial airports, 675; Department of Commerce intermediate fields, 364; army airdromes, 52; naval air stations (including Marine and Coast Guard), 13; State operated fields, 4; marked auxiliary fields, 310; fields for miscellaneous Government activities, 1. Of the total number, 680 airports and landing fields had night lighting equipment. In addition there were 352 proposed airports.

**BRITISH AIR MAIL.** The British Air Mail Service during 1931 had a striking development and about two and a quarter million letters were dispatched by air, or an increase over 1930 of about a half a million letters, or approximately 10,000 letters a week. The total weight of the letter mail sent by air in 1930 was 52.4 tons or an increase of 29 per cent over 1930 and 74 per cent over 1929. Air parcel mail dispatched during 1931 aggregated 62½ tons or 10 tons more than the letter mail, but the figure was somewhat less than in 1930. The total weight of all British air mail, letters and parcels, for 1931 was 115 tons compared with 106 tons in 1930 and 88 tons in 1929.

**AIR ROUTES IN ASIA.** By the end of 1931 the advantages of air transportation in Asia, both for mail and for passengers, were fully recog-

nized and substantial financial support was being granted by Great Britain, France, and the Netherlands to air transport companies in order to assure scheduled and regular communication between Europe and India, French Indo-China, and Netherland East Indies. Through service and rates were established. It was recognized that self-support was not necessary for these transportation lines and that government assistance must be extended, for rapid conveyance of mails was an important trade advantage while passenger patronage was worthy of considerable encouragement. India, Indo-China, and the Netherland East Indies could be reached by air in less than one half or one quarter of the time required by the fastest means of surface transport, so that to secure speed, safety, and comfort through improved and efficient aircraft, the governments concerned were seeking to encourage and establish air lines. In 1931 between Europe and the Orient, 24,492 miles of established service were maintained with weekly service in some cases, and in the case of the German-Russian companies a daily service. Local transportation companies in the various Eastern countries were carrying on an improved service, and the total mileage of the scheduled routes for the more important countries was as follows: China, 1535 miles; Japan, 1888 miles; Netherland East Indies, 2698 miles; Persia, 2050 miles, and Siam, 503 miles. In the U. S. S. R., local service was maintained by the "Dobrolet" (Volunteer Aviation Company) to the amount of 16,257 miles, with a network of 27 services or more than double the amount available in 1928 when the five-year plan was adopted. The longest route was from Moscow to Irkutsk, 2920 miles with flights made on even dates in both directions. In the U. S. S. R., there was a total mileage of 16,257 miles. The grand total mileage of local service in Asia by the end of the year maintained 24,931 miles which, with the foreign service, made a grand total of 49,432 miles in Asia.

**AIRCRAFT INDUSTRY IN THE U. S.** In 1931, the American Aircraft Industry was estimated by the President of the Aeronautical Chamber of Commerce of America to have produced 2394 airplanes valued at \$19,626,766 and 3766 engines valued at \$14,609,949, making a total value of \$33,236,715. These figures may be compared with the 1929 production of 6034 airplanes and 7378 engines valued at \$70,053,130. This was, of course, the high water mark in the industry so far as production was concerned, but most of this very large production remained unsold at the end of the year. Examining the 1931 production in more detail, it was estimated that of the 2394 airplanes manufactured, 812 or 33.9 per cent were military, valued at \$12,971,028, and of the 3766 engines, 1800 or 47.8 per cent were military, valued at \$10,417,718. The commercial planes built in 1931 were estimated at 1582 or 66.1 per cent and were valued at \$6,655,738, while the commercial engines totaled 1976 or 52.2 per cent, valued at \$4,192,231. In other words, out of a total estimated production of \$33,236,715 in 1931, \$23,658,569 or 70.6 per cent represented sales to the United States War and Navy Departments, and \$10,848,969 or 30 per cent represented sales to private and business owners and aerial operators and operators of schedule transport lines. Estimating the commercial airplane production in 1931 at 1582 units there were 704 light airplanes with a value, including engines, of \$1,360,583;

299 cabin planes for business and aerial service use valued at \$1,680,274, and 65 multi-engined transports valued at \$1,478,206.

According to the U. S. Department of Commerce the number of aircraft, licensed and unlicensed, in the United States and its possessions on Dec. 31, 1931, was 10,780. Of the 17,739 pilots' licenses, 6881 were in the transport grade, 1586 limited commercial, 46 industrial and 9226 in private. The licensed pilots included 532 women, classified as follows: Transport, 42; limited commercial, 56; industrial, 1, and private, 433. The 9016 mechanics in the country include five women. Of the aircraft, 7553 were licensed, and 3227 unlicensed.

New York State had 1227 aircraft on Dec. 31, 1931, more than any other State, and California ranked second with 1186 planes. California had 3327 pilots as compared with 1820 in New York, and 1644 mechanics as against New York's 860. New York led in licensed planes with 973, California following with 959 and Illinois third with 511. New York had 254 unlicensed craft, California 227, and Illinois 223.

The National Advisory Committee for Aeronautics continued its experimental work in which the important investigations begun in the high pressure wind tunnel at Langley Field, Va., were further advanced by the construction of a tunnel capable of handling full-sized airplanes up to 45 ft. span and speed up to 150 m.p.h. This was the largest wind tunnel yet to be built. The equipment at Langley Field also was augmented by the completion of the largest towing basin available in any experimental or other air station. In this seaplane testing basin full-sized floats could be studied.

During the year, a number of important auxiliary devices were developed by various scientists which aimed to make flying safer and more even. Dr. Irving Langmuir of the General Electric Company devised apparatus for guiding airplanes through fog along a path of light beacons invisible to the eye of the pilot. He employed photoelectric cells which were able to take light sent out by the beacons through the fog which rendered these marks invisible to the human eye. Another interesting device was an instrument developed at the National Bureau of Standards by F. G. Kear and G. H. Wintermute, in which were received simultaneous visual range beacon signals and voice reports on the weather. The voice signals were filtered out and sent to the head phones of the aviator.

AUTOGIRO. Commercial application and further experimental work by inventors marked the year 1931, and the autogiro not only found a market and use but figured in a number of long flights. The Autogiro Company of America, which controlled in the United States the Cierva patents, licensed three companies, Pitcairn, Kellett, and Buhl, to undertake such construction and about 60 autogiros were built during the year. A cabin autogiro was developed by the Kellett Company and one with a pusher was brought out by the Buhl Aircraft Company. A machine with feathering rather than articulated vanes marked a new type of rotor-wing craft, which was developed by E. Burke Wilford, and showed a departure from previous designs. On April 12, the U. S. Department of Commerce granted an unrestricted, improved type certificate or license to the autogiro model PCA-2. The development of the autogiro in the United States had been due in large

measure to Harold F. Pitcairn and this was recognized on April 5 in the award to him by the National Aeronautic Association of the Collier Trophy for 1930. This award is made "for the greatest achievement in aviation in America, the value of which has been demonstrated by actual use of it the preceding year." In England, the Cierva Autogiro Company, Ltd., brought out two new types of machine during the year, one of which was an enclosed cabin two-seater, and was developing both a light single seater sports model and a large passenger-carrying machine. At the end of the year an autogiro had been completed in Germany.

The U. S. Navy acquired for experimental purposes an autogiro and equipped it with floats, while the British and French navies during the year were seeking to develop autogiro flying boats. Both types were planned to operate in rough water and thus extend the function of the ordinary type of flying boat so that the reconnaissance system based on the use of airships might be improved and simplified.

GLIDERS. An important achievement in connection with a motorless plane or glider was the crossing of the English Channel on July 19 by Lissant Beardmore, a Canadian, who was towed to the height of 9000 ft. by an airplane and was able to glide successfully across this body of water in one hour and a half. This crossing by a motorless sail-plane occurred 22 years after the first crossing of the Channel by Bleriot in his airplane driven by a motor. On the following day, July 20, Robert Kronfeld, an Austrian glider expert, crossed the Channel both ways the same day in a motorless plane, winning \$5000 offered by the *Daily Mail*.

BIBLIOGRAPHY. Among some of the more important works on Aeronautics that appeared during the year or in 1930 are the following: Lieut. D. W. Tomlinson, *The Sky's the Limit* (Philadelphia); E. W. Teale, *The Book of Gliders* (New York, 1930); R. S. Barnaby, *Gliders and Gliding* (New York, 1930); Aluminum Company of America, *Aluminum in Aircraft* (Pittsburgh, 1930); A. W. Judge, *Automobile and Aircraft Engine* (New York); R. Sidney Bowen, Jr., *Flying from the Ground Up* (New York); I. W. Miller, *The Aircraft Mechanic's Handbook* (New York); Capt. I. E. Elm, *Manual of Flight*, (Philadelphia, 1930); Dr. Alfred Wegerdt, *Deutsche Luftfahrtgesetzgebung* (Berlin, 1930); Lieut. V. C. Finch, *Preparing for Aviation* (New York); George R. White, *Zoom* (New York); B. F. Eddy, *Aircraft Radio* (New York); Augustus Post, *Skycraft* (New York, 1930); O. H. Kneen, *Everyman's Book of Flying* (New York, 1930); Malcolm Ross, *Sailing the Skies* (New York); Edward Shenton, *Couriers of the Clouds* (Philadelphia); Frederick Bedell, Ph.D., with Theodore E. Thompson, M.E., *The Airplane* (New York, 1930); Juan de la Cierva and Don Rose, *Wings of To-morrow: The Story of the Autogiro* (New York); Anthony H. Fokker and Bruce Gould, *The Flying Dutchman* (New York); K. W. Colegrove, *International Control of Aviation* (Boston); Ray F. Kuns, *Aviation Engines* (Chicago); Maj. Victor W. Page, *Aviation Engine Examiner* (New York); Lt. Col. W. Lockwood Marsh, Editor, *The Care and Maintenance of Aircraft* (London); W. L. G. Joerg, *Brief History of Polar Exploration Since the Introduction of Flying* (New York); Lieut. J. R. Johnson, *Peru from the Air* (New York); Frank Hawks, *Speed* (New

York); Hugh Allen, *The Story of the Airship* (Akron); J. C. Hylander, *Cruisers of the Air* (New York); Lieut. C. J. Maguire, U. S. N., *Aërology* (New York); Dr. Werner von Langsdorff, *Taschenbuch der Luftflotten und Das Segelflugzeug* (Munich); J. A. Van Den Broek, *Elastic Energy Theory* (New York); T. G. Whitlock, *Elementary Applied Aërodynamics* (New York); Maj. Oliver Steward, *Cross-Country Flying* (New York); Merrill Hamburg, *Beginning to Fly, The Book of Model Airplanes* (New York, 1930); Capt. Richard Duncan, *Stunt Flying* (Chicago); Wesley L. Smith, *Air Transport Operation* (New York); J. E. Younger and B. M. Woods, *Dynamics in Airplanes and Airplane Structures* (New York); M. M. Farleigh, *Aircraft Engines* (New York); G. A. Crocco, *Elementi di Aviazione* (Rome); John E. Gingrich, *Aërial and Marine Navigation Tables* (New York); Lieut. Comdr. P. V. H. Weems, U. S. N., *Air Navigation* (New York); Capt. Leslie S. Potter, *The Navigation of the Air and Meteorology* (New York); Wiley Post and Harold Gatty, *Around the World in Eight Days* (New York); Percival White and Mat White, *Gliding and Soaring* (New York); C. F. Snowden-Gamble, *The Air Weapon, A History of British Military Aëronautics*, vol. i, 1783-1914 (London); H. A. Jones, *The War in the Air, The Official History of the Part Played by the Royal Air Force in the Great War*, vol. iii (London); Prof. F. A. Magoun and Eric Hodgins, *History of Aircraft* (New York); C. C. Rohling, *National Regulation of Aëronautics* (Philadelphia); Squadron Leader C. G. Burge, Capt. J. L. Pritchard, and Lieut. Col. W. Lockwood Marsh, Editors, *Handbook of Aeronautics* (London); *Pilots' Handbook* (Los Angeles); J. D. Haddon, *An Introduction to Aëronautical Engineering*, vol. ii, *Structures* (London); J. L. Naylor and E. Ower, *Aviation of To-day* (London); Howard C. Stark, *Blind or Instrument Flying* (Newark, N. J.); John G. Younger, *Airplane Construction and Repair* (New York); P. C. Grose, *The Problem of Vertical Flight* (McComb, Ohio); F. D. Bradbrooke, *The Light Aeroplane Manual* (London); E. P. Warner and S. P. Johnston, *Aviation Handbook* (New York). *The Aircraft Year Book for 1932* (New York, 1932) contained a summary of progress especially in the United States for 1931 with full statistics for the industry in addition to descriptions and to accounts of technical progress. See MILITARY PROGRESS; NAVAL PROGRESS.

#### AEROPLANES. See AëRONAUTICS.

**AFGHANISTAN**, af-gân'-i'stân'. An independent kingdom of central Asia, serving as a buffer state between India and the Soviet Union. The estimates of the area vary from 245,000 to 270,000 square miles, while the population is roughly estimated at about 11,000,000. King in 1931, Muhammed Nadir Khan, who was called to the throne Oct. 16, 1929. Capital, Kabul, with a population of about 100,000.

Other important towns are Kandahâr (40,000). Herât (121,000), and Mazar-i-Sharif (40,200). The Afghan is the dominant race and the chief tribes are the Durrani and the Ghilzais, numbering about 2,200,000. There were about 70 Europeans in the country in 1931. The prevailing languages are Persian and Pushtoo and the dominant religion is Islam. Free elementary and secondary schools exist in various parts of the country, but the number of literate persons comprised a relatively small part of the total.

**PRODUCTION, ETC.** The largely mountainous country contains a number of fertile plains and valleys where irrigated crops of cereals, fruits, and vegetables are raised. Pears, apples, almonds, peaches, quinces, apricots, plums, pomegranates, grapes, figs, and cherries constitute a staple food of the population and much preserved fruit is exported. The native fat-tailed sheep is the principal domestic animal. Native industries, chiefly of the cottage type, supply the local demand for cloth, soap, boots, and other articles; carpets and rugs are woven for export. Army supplies are made at a state-owned factory in Kabul. Copper, lead, iron, coal, lapis lazuli, and some gold are found, the first named in large quantities. There is little mining activity, however. Afghanistan's trade with India averages about \$15,000,000 annually in normal times. The principal exports are wool, silk, cattle, hides, tobacco, timber, fruits, and vegetables, cereals, asafetida and other drugs, and spices. Imports in 1931 came chiefly from the Soviet Union. Cotton goods, sugar, leather, hardware, and silver treasure are the chief imports from India. The two leading trade routes to India are from Kabul to Peshawar by way of the Khyber Pass and from Kandahâr, centre of a rich fruit-growing region, to the railway terminal at Chaman, India. There are no railways in Afghanistan and transport is by caravan, or by motor over the rough roads connecting Kabul with the chief cities. A 40-year contract for the establishment of air lines from Herât to Kandahâr and Kabul, with branch lines to the northwest frontier of India, was obtained by the Junkers company of Germany in 1931. The lines would connect at Herât with the Teheran-Meshed Persian service, which extends to Europe. A Soviet weekly air service connects Kabul with Termez in Soviet Central Asia.

Constitutional government in the country, which was interrupted during the civil strife of 1929, was reestablished with the crowning of Muhammed Nadir Khan (born April 10, 1885). There are legislative and state assemblies and a Cabinet presided over by the King. The country is divided into five major and four minor provinces, each administered by a governor. In 1930 the Afghan consul general at Delhi announced that annual revenue approximated \$23,400,000. Other estimates placed it as low as \$5,000,000. The army, which was under reorganization in 1931, consisted of about 25,000 regular troops and a small air force. In addition, the war-like Afghan tribes constitute a large reserve of irregular troops.

**HISTORY.** Two years of civil war and insurrection, inaugurated by the revolt against King Amanullah in 1929, was succeeded in 1931 by peace and apparent contentment throughout most of the country. Opening the annual National Assembly at Kabul July 6, the King reported that his authority had been established throughout the country and that taxes were everywhere being paid. Nadir Khan had obviously profited from the unfortunate results of ex-King Amanullah's effort to modernize his wild subjects over-night. The King pursued a wisely tempered policy of progressive conservatism which appeared to have won the approval of the fanatical tribesmen. His last open opponent was eliminated with the expulsion from northern Afghanistan of Ibrahim Bey, so-called "Robin Hood of Bokhara." Some of the semi-

independent tribes along the Indian border continued their sporadic raids into Indian territory, however, despite the King's injunction against it (see INDIA under *History*). In his address to the National Assembly, King Nadir Khan announced that he had accepted an unconditional gift from Great Britain of a non-interest-bearing loan of £175,000, together with 10,000 rifles and 500,000 cartridges.

**AFRICA.** The various divisions of Africa in this volume are discussed under their own heads. See articles on the respective countries and territories, including ETHIOPIA; KENYA; EGYPT; MOROCCO; TUNIS; SOUTH AFRICA, UNION OF, etc. See also the articles ANTHROPOLOGY; ARCHAEOLOGY; PHILOLOGY, MODERN; and EXPLORATION.

**AGNES SCOTT COLLEGE.** An institution for the higher education of women in Decatur, Atlanta, Ga., founded in 1889. The enrollment for the autumn of 1931 was 475. The faculty numbered 51 members, and the officers of administration, 14. The endowment amounted to \$1,256,000, while the gross income for the year was approximately \$335,000. There were 23,250 volumes in the library. During 1931 steady progress was made on building development; among the buildings under construction were the Auditorium and Fine Arts Building. President, James Ross McCain, Ph.D., LL.D.

**AGNEW, WILLIAM HENRY.** An American clergyman and educator, died in Rochester, Minn., Feb. 13, 1931. He was born in Westphalia, Kan., Oct. 12, 1881, and was graduated from St. Louis University in 1905. Having been a member of the Society of Jesus for a number of years, he was ordained priest in the Roman Catholic Church in 1915. He served as dean of the department of science and mathematics at Loyola University, Chicago, Ill., for four years, and in a similar capacity at St. Louis University for one year. From 1919-20, he was professor of natural theology at St. Louis University, before becoming president of Loyola University in 1921. During 1927-28 he was rector of the Sacred Heart Church in Chicago, and at the time of his death was president of Creighton University, Omaha, Neb. At various times, he was chaplain of public institutions in Chicago and New York. He lectured widely at religious and educational institutions and was at one time editor of *The Queen's Work*, a magazine.

**AGORA IN ATHENS.** See ARCHAEOLOGY.

**AGRAMONTE, ARISTIDES.** A Cuban bacteriologist, died in New Orleans, La., Aug. 17, 1931. He was born in Camagüey, Cuba, June 3, 1869, and was brought to the United States in infancy. After attending the College of the City of New York during 1885-87, he entered the College of Physicians and Surgeons of Columbia University, from which he was graduated in 1892. He practiced in New York City until the outbreak of the Spanish-American War, when he became an assistant surgeon in the United States Army. He remained in Cuba after the war, being appointed professor of bacteriology and experimental pathology at the University of Havana.

In 1901 he was a member of the U. S. Army Board that discovered the transmission of yellow fever by the mosquito. He also served as chairman of the Board of Infectious Diseases and as a member of the National Board of Health of the Republic of Cuba. In 1922 he was made Secretary of Public Health in the

cabinet of President Zayas, and prior to his death had been made head of the department of tropical diseases at the Louisiana State University medical school and president of the Pan American Medical Association. He was a laureate of the Institut de France, for which he received the Bréant Prize, and had published more than 100 monographs and articles on hygiene and tropical medicine.

**AGRARIAN CONFERENCES.** See BULGARIA under *History*; AGRICULTURE under *World Agriculture*.

**AGRICULTURAL EXPERIMENT STATIONS.** Experiment stations in the United States, its territories, and insular possessions continued to deal with a wide range of intensive and productive agricultural research. About \$18,000,000 was available for the support of the stations, the Federal Government furnishing \$4,340,000 which included \$90,000 for each State and \$20,000 for Hawaii. Stations maintained by the Department of Agriculture in Alaska, Hawaii, Porto Rico, Guam, and Virgin Islands received appropriations totaling \$250,200.

Research projects active at the stations totaled over 7000; the Adams fund supported more than 400 and the Purnell fund more than 1300. Coöperation of the stations with the Department of Agriculture in more than 1000 projects covering national, regional, and local problems economized effort, coordinated different investigations, and prevented duplication of work. The *Experiment Station Record*, an important factor in the progress of agricultural research, reviewed during the year nearly 1300 station and departmental publications. Changes occurred in the directorships of the Arizona, Maine, New York Cornell, Porto Rico Insular, Virgin Islands, and Wisconsin Stations. The personnel, including those doing some teaching, exceeded 3600, of whom over 1900 devoted their time exclusively to station work.

Under an Act of Congress extending benefits of the Hatch Act to Alaska, a station was established in connection with the Alaska Agricultural College and School of Mines and was merged with a station operated by the U. S. Department of Agriculture at Fairbanks since 1907. The Kalsin Bay Station of Kodiak Island was closed June 15, and the Department work centred at Matanuska and at Sitka. In Hawaii, a consolidation of experiment station work under the joint supervision of the Department of Agriculture and the University of Hawaii, provided for by Act of Congress passed May 16, 1928, brought about increased efficiency and economy. A similar measure approved Mar. 4, 1931, also extended the benefits of the Hatch and supplementary acts to Porto Rico, and provided for the coordination of experiment station work in the island. The Virgin Islands Station was reorganized and received funds for expanding its work.

New buildings erected in 1931 included an agricultural engineering building at the Kentucky Station; the Dalrymple Memorial animal pathology plant at the Louisiana Station; a horticultural building at the Maryland Station; a dairy husbandry building, the first unit for an agricultural quadrangle, at Virginia Polytechnic Institute; and a refrigeration plant at the Florida Station. The Wisconsin Station was erecting a new animal research laboratory.

The Kansas Station and College received increased biennial appropriations aggregating \$2,-

751,600, largely for research, and for construction of a new dairy barn and dairy plant. An appropriation of \$900,000 as an unemployment relief building fund was to be used at Pennsylvania State College for a dairy husbandry building to cost \$500,000 and a home economics unit to cost \$400,000. The Minnesota Legislature provided for the erection and equipment of a farm crops field house at the University Farm, and for an office building and laboratory and more land for the fruit farm near Zumbra Heights. The Nebraska Station received appropriations for building the animal husbandry building, and the Oklahoma Station, for a meat laboratory and a horse barn.

The New York College of Agriculture of Cornell University, for the ensuing year, was provided State appropriations exceeding \$1,750,000 and the Home Economics College \$300,000. The building being constructed to house the departments of agricultural economics and farm management and of rural sociology was to cost nearly \$600,000. Plans were completed for a home economics building to cost about \$985,000. The budget of the New York State Station for the fiscal year 1931-32 totaled \$503,480, an increase of \$126,655 over 1930-31, and included \$80,000 for greenhouse equipment.

The State of New Jersey received as a gift from James Turner of Montclair for administration as a dairy research station, 1100 acres of crop and pasture land in Sussex County, 270 Guernsey and 55 Holstein cattle, elaborate buildings and equipment. In Montana a sheep station was developed at Fort Ellis near Bozeman.

The U. S. Department of Agriculture coöperating with the University of Tennessee opened a dairy experiment station at Lewisburg, Tenn., to serve the industry in the blue grass limestone region. In Florida, the Department opened the Florida Citrus Products Laboratory at Winter Haven, in buildings, grounds, and facilities furnished by the citrus industry of the State; and at Olustee, near the Osceola National Forest, was erecting twelve buildings for the Naval Stores Experiment Station, which was expected to be completed by Mar. 1, 1932. New stations were established in Washington for study of soil erosion in the Washington-Oregon-Idaho wheat belt and in Iowa for similar study in the rich loessial Corn Belt soil area in the Missouri River Valley.

Director James T. Jardine of the Oregon Station was appointed chief of the Office of Experiment Stations, U. S. Department of Agriculture, to the vacancy existing since the death of Edwin W. Allen in November, 1929, and assumed his new duties in September, 1931. Leland O. Howard, former chief of the Bureau of Entomology, Department of Agriculture, was awarded the 1931 Capper gold medal and \$5000 for distinguished service to American agriculture. The award, given annually by Senator Arthur Capper, of Kansas, was won in 1930 by Stephen M. Babcock (q.v.), professor emeritus of agricultural chemistry of the Wisconsin Station and University, who died July 1, 1931. In Canada, Frank T. Shutt retired as Dominion chemist and assistant director of Dominion Experimental Farms, terminating public service of 44 years.

**NECROLOGY.** Experiment station workers dying during 1931 included W. J. Morse, director of the Maine Station; Albert Dickens, professor of horticulture, at the Kansas Station; M. E. Jaffa,

professor emeritus of nutrition, and W. A. Lippincott, professor of poultry husbandry, both of the California Station; F. A. G. Muir, consulting entomologist of the Hawaiian Sugar Planters' Station; M. P. Sweeney, associate chemist of the New York State Station; and George Severance, head of the department of farm management and economics, and H. F. Holtz, associate in soils, both of the Washington Station. Among the pioneers of agricultural research dying were J. H. Comstock, former head of the entomology department of Cornell University; C. C. Georgeson, ex-director of the Alaska Stations; W. H. Jordan, former director of the New York State and Maine Stations; Lucius L. Van Slyke, former chemist and acting director of the New York State Station; and L. H. Pammel, former botanist in the Iowa Station.

Peter J. Wester, tropical horticulturist, who established the Lamao (P. I.) Experiment Station in 1912, died in Manila August 18. Edmond Rabaté, director of the National Institute of Agriculture of France and administrator of the National Institute of Colonial Agriculture, died April 18.

**BRITISH EMPIRE.** The new Imperial Agricultural Research Bureaus were fully organized and functioning actively and their location at existing research institutions enabled them to operate economically and efficiently. The bureau of soil science was located at Rothamsted Experimental Station, at Harpenden; of animal health, the Veterinary Laboratory, Weybridge, Surrey; of plant genetics (crops other than herbage), School of Agriculture, Cambridge; of fruit production, East Malling Research Station, East Malling; of agricultural parasitology, Winches Farm, St. Albans, Herts, all in England; of plant genetics (herbage), Aberystwyth, Wales; and of animal nutrition, Rowett Research Institute, Aberdeen, and of animal genetics, University of Edinburgh, both in Scotland. New fruit research laboratories, built by the Empire Marketing Board, were provided on the East Malling Station. The Ditton Laboratory, said to be the largest cold storage plant in existence, opened for research into fruit storage, contained a "model ship's hold" with a capacity of 120 tons of apples. A gift to the University of Cambridge by the International Education Board of £700,000 contingent upon the university securing £479,000 elsewhere became available, £162,000 being allotted for agricultural work, including the building and equipment of a new laboratory.

Ontario Agricultural College at Guelph, an important centre for agricultural research in Canada, occupied a new administration building and students' residence, and completed extensive greenhouses which supplement the new horticultural building. It was host from June 22 to 26 to the 11th annual convention of the Canadian Society of Technical Agriculturists, a Dominion-wide organization of station and extension workers. Research continued to go forward at the other Provincial Colleges of Agriculture and on the efficient Dominion Experimental Farms.

The Imperial Sugar Cane Research Conference, held by the Empire Marketing Board in June, 1931, recommended the establishment for West Indies, of a sugar cane breeding station in Barbados, and a sugar cane quarantine station, and other cane breeding stations in each of India, Mauritius, and Australia. The Board granted £15,790 over

five years for the development of rice research in India to increase yields and to improve quality.

In Southern Rhodesia, the main experiment station was in operation at Salisbury, and demonstration stations at Bulawayo, Gwelo, and Enkeldoorn. The government sand veld farm established in 1930 at Marandellas comprised a demonstration sand veld farm, tobacco, and pasture land research stations, and a crops experiment station. The British South Africa Company, to meet practical needs of the citrus industry in Southern Rhodesia, established a citrus experiment station at Mazoe.

**RUMANIA.** The Agricultural Research Institute of Rumania, formally organized in 1929, comprised sections of phytotechnology and phyto-genetics, chemistry, phytopathology, and rural economics, and was expected to add sections on animal production and rural engineering. It also took under its direction the Central Agronomic Station at Bucharest; the agricultural chemistry, agricultural technology, seed control, and medicinal plants stations at Cluj; the phytopathology station at Chişinău; the machinery testing station at Bucharest; the plant improvement and experiment stations at Jassy and Cluj; and experiment stations at Mărculeşti and Tighina.

**UNION OF SOVIET SOCIALIST REPUBLICS (Russia).** The Soviet Institute for Plant Protection, established under a decree of June 25, 1929, as one of the institutes of the Academy of Agricultural Science, and headed in 1931 by Director N. V. Kovalev, had for its object the development in a centralized way, of scientific work connected with the protection of plants and animals from diseases and other pests, and currently comprised divisions of administration, economics, applied entomology and zoology, phytopathology, and preventive measures. The administrative headquarters and certain activities were located on Yelagin Island, Leningrad, while other sections are elsewhere in Leningrad and in Moscow. Plans were for the central institute to be supplemented by similar institutes in the Ukraine, Transcaucasia, and Central Asia, while existing institutions were to be reorganized into 12 scientific experimental bases, and from 3 to 12 agricultural stations headed by the various institutes, were contemplated for each of the various regions and provinces of the Soviet Union.

**BIBLIOGRAPHY.** Consult also *Report on the Agricultural Experiment Stations, 1930*, by W. H. Beal and H. M. Steece (U. S. Department of Agriculture); *Report of the Acting Chief of the Office of Experiment Stations, 1931*, by Walter H. Evans (U. S. Department of Agriculture); *Survey of Land Grant Colleges and Universities (section on Research)* (U. S. Department of the Interior, Office of Education, Bul. 9, 1930); *Stations Expérimentales et Autres Institutions Officielles ou Privées s'occupant du Développement et de l'Amélioration de l'Agriculture dans les Pays Chauds* (International Institute of Agriculture, Rome, 1931).

#### AGRICULTURAL EXTENSION WORK.

Extension problems were more numerous, more complex, and more widespread during 1931 than ever before. Average farm prices declined 50 per cent over the previous low point reached in 1929. This added slump in prices came as a crowning capstone to a decade of agricultural depression marked by continuously falling prices, overproduc-

tion, droughts, storms, floods, insect plagues, and epidemics of diseases of crops and livestock.

Although generally there was no actual shortage of food or feed on the farms in the United States, cash was very scarce. Extension workers therefore devoted most of their efforts toward showing farmers how to supplement their sources of farm income and how to maintain as good a standard of living as possible with the income available. Extensive crop shifts were necessitated by the price-breaking surpluses of wheat and cotton that had accumulated. The development of new sources of income became imperative. Supplemental lines of production had to be considered and adopted. County extension agents throughout the year gave constant thought and study to the situations in which farmers found themselves individually and collectively. Reliable and practical information from the State agricultural colleges and the U. S. Department of Agriculture was in great demand. Consulting with farmers as to their operations was not a new activity of extension agents. Crop adjustments had been made before with the aid of extension workers in many counties and in entire States. It was a recent development, however, for the entire force of the cooperative extension service to focus its attention largely on problems of agricultural adjustment the country over.

Farmers were helped to plan their farm operations more intelligently with the primary purpose of achieving greater efficiency of production on less land, and that land only the best of the farm. Where it seemed advisable to curtail or abandon a line of production, substitute crops or enterprises were considered. Many farmers were encouraged to develop new activities. They were advised to take steps in adjusting their economic life to a sound programme of land utilization by withdrawing from cultivation the poorer land of the farm and returning it to the production of pasture or woodland. They grew home and farm supplies as much as possible and built up reserves of feed, seed, and livestock. This plan of farming, generally known as the "live-at-home" type, was of considerable benefit during the year. It helped farmers to increase the non-cash income of the farm family in food and feed crops and meat and other livestock products for use on the farm and it enabled them to reduce considerably their cash outlay.

In many districts definite systems of soil improvement were adopted, wood-lot and forest-area developments were started, and minor cash enterprises were launched to make up for deficiencies in the income from major crops. Production costs were reduced by the use of better seed and by more scientific handling and feeding of livestock.

The grading, pooling, and selling of marketable crops received closer attention by the agents during the year. Existing cooperative-marketing organizations were strengthened and new ones were organized with the advice and help of extension workers but without the assumption of undue responsibility. The establishment of credits on a sound basis was promoted and the use of credit where adequate returns could be expected was encouraged. In this field much help was extended to farmers in taking annual inventories and in preparing credit statements for the use of local banks. Extension work in the field of farm man-

agement became a well-established part of the basic programmes of most of the various States.

The U. S. Department of Agriculture and the State agricultural colleges speeded up the assembling of economic facts applying to local conditions. A national and four regional outlook conferences were held at which State and federal extension workers considered available economic data concerning farm industries and issued statements on the production and demand situation. State workers attending these conferences returned to their own fields better equipped with the data thus made available to aid in appraising local situations. Between the close of the national conferences held in Washington, D. C., in January and the planting season, 12,000 local outlook meetings attended by more than 800,000 farmers were conducted by State and county extension workers. At these local conferences, farmers were apprised of the economic situation and advised of the adjustments to make to bring their various lines of production into closer relationship with current economic needs.

Considerable help was given to farmers in crop production, in dairying, in animal husbandry, and in horticulture. Thousands of dollars were saved by farmers who were shown how to reduce losses from insect pests and from plant and animal diseases. Assistance was given in livestock improvement through culling out unprofitable cows and better management of animals. Tree and shrub planting was encouraged both for shelter and the beautification of home grounds. Farmers were taught how to build terraces and soil-saving dams to prevent erosion.

Through helpful service to the farm family and the farm home, the home demonstration agents proved their practical and financial worth. They helped farm women and girls to make many needed improvements in their home practices. More time for rest and recreation was released to many farm women who rearranged their household equipment, planned their housework on a more efficient basis, and added homemade or inexpensive purchased conveniences and labor-saving devices with the advice of home demonstration agents. Agents also assisted farm women in the development of the resources of the farm home through establishing home industries. Women were shown how to prepare and sell surplus garden, poultry, and dairy products. The sale of standardized preserved-food products proved profitable. Handicraft activities, such as the making of rugs, woven materials, baskets, leather articles, pillows, and the like were encouraged. Other sources of income which agents helped the farm women to establish were roadside markets and tourists' homes. Farm women and girls were assisted also in the economical buying of supplies, in the preservation of home-grown foods, in the refinishing of furniture, in the making of inexpensive improvements in the house, and in the planting and care of flowers and shrubbery. They were taught the relation of better food habits to health, and how to plan the family food needs, the construction, selection, and renovation of clothing, child care, and many other things of practical benefit.

Boys and girls on the farm joined in the general effort to increase farm incomes and maintain farm living standards. More than 845,000 boys and girls were enrolled in the 4-H clubs in 1931. Under the supervision of extension agents they learned how to grow cotton, corn, potatoes, and

other crops and how to care for calves, pigs, poultry, and sheep. They also received training in marketing their products, in handicraft work, in the preservation of fruits and vegetables, the cooking and serving of meals, the making and remodeling of clothing, and the furnishing and decorating of rooms. Reports indicate that there was an increase in the number of short courses at the colleges, summer camps, weekly and monthly club meetings, music-appreciation programmes, growth, health, and posture work, community improvement activities, and other co-operative undertakings that contribute to the general all-round development of farm boys and girls. The influence of 4-H club work was immeasurable. Former club members more than ever before were taking their places as leaders of adult farm groups and as officials of farmers' organizations.

Tentative arrangements for coöperation in extension work between the U. S. Department of Agriculture and the University of Porto Rico were made by C. W. Warburton, director of extension work, during a brief visit to the island in December. This coöperation was authorized by an act of Congress approved Mar. 4, 1931, which provided that the several extension acts should apply to Porto Rico beginning July 1, 1932. An initial appropriation of \$50,000 was provided, this sum to be increased by \$10,000 annually until the total to which Porto Rico is entitled under the federal act is reached.

Funds provided for coöperative extension work during the fiscal year ending June 30, 1932, from all sources totaled approximately \$25,922,000, a decrease of about \$200,000 from the previous year. This decrease was due principally to reductions in State and county appropriations. Of the total funds available for extension purposes, \$10,240,000, or 39.5 per cent, were contributed by the federal government; \$7,188,000, or 27.7 per cent, were from State appropriations to the agricultural colleges and other State agencies; and \$8,494,000, or 32.8 per cent, came from county appropriations for extension work and from local organizations. About 95.7 per cent of all funds allotted for coöperative extension work during the year came from public sources.

From Dec. 31, 1930, to Dec. 31, 1931, there was a net decrease of nine persons in the total number of extension workers. Of the 6104 persons engaged in extension work in the United States and Alaska, Hawaii, and Porto Rico at the end of the year, 2726 were in county agricultural agent work, 1404 in home demonstration work, 356 in work with 4-H clubs, and 326 in negro extension work. There were 50 extension directors, one in each State and the Territories of Hawaii and Alaska, 31 assistant directors, and 1211 subject-matter specialists.

A synopsis of the statistical results achieved in 1930 affords an idea of the volume of work carried on annually and the results obtained. Extension workers supervised a total of 934,182 result demonstrations that were carried on by farm men and farm women in 1930 as a means of showing others the improvement in farm income, comfort, and beauty that can be obtained by putting better farm and home practices into use. Boys' and girls' 4-H club members completed 971,300 demonstrations covering every phase of farm or farm home activity. These demonstrations were supplemented by personal visits made by extension workers to farms and farm homes,

by the preparation of articles for the press, meetings, tours, correspondence and circular letters, radio talks, office calls, short courses, and other means of keeping in contact with farm people. A total of 318,400 progressive farm men and women and older club members voluntarily contributed their time and effort in assisting county extension agents in their demonstration work. They acted as local leaders in their communities, helped formulate extension programmes, conducted demonstrations, trained 4-H club members, and in many other ways helped to bring about the wider adoption of better practices. Agents made 1,758,700 visits to farms to discuss better agricultural practices with the farmer and 910,000 visits to discuss improvements in the home with the farm woman. A total of 402,500 meetings were conducted by extension workers at which better methods of carrying on farm and home operations were explained to 7,219,100 persons. A total of 822,700 farm boys and girls were enrolled in 56,180 4-H clubs, or an increase in enrollment of 66,600 over 1929. Some of the results achieved by these boys and girls through their 4-H club work were the cultivation of 52,000 acres of corn, 30,000 acres of cotton, 5300 acres of potatoes, 4800 acres of wheat, 3700 acres of tobacco, and 22,300 acres of home gardens. They raised 78,700 hogs, 50,500 dairy and 15,300 beef cattle, 28,800 sheep, and 2,272,700 standard-bred fowls, and canned 3,504,000 jars of fruits, jellies, and vegetables.

Nine States conducted 2584 farmers' institutes extending over a period of 3752 days. Instruction was given during these institutes to 1,269,400 persons at 8569 sessions. The cost of these institutes was \$176,008, of which \$112,416 was from State appropriations and \$63,592 from local contributions. Although there was a slight decrease in the number of institutes held, number of days that they lasted, and sessions held, there was a slight increase in the number of persons attending and in the amount of money expended.

CANADA. Extension work through the provincial departments of agriculture was conducted, and farmers, farm women, and boys and girls were taught better practices in agriculture and home economics by agricultural representatives through the media of boys' and girls' clubs, short courses at the colleges, demonstration farms, women's institutes, judging competitions, lectures, demonstration trains, radio, and the like. In New Brunswick, poultry club work made substantial progress since its organization in 1918. The popularizing of bred-to-lay poultry in the province and the education of boys and girls have been the two important objects of the work. Each year a fair is held at which members compete for prizes. There is also a poultry-judging competition. Demonstrations are carried on throughout the year and an endeavor is made to give each member as much individual instruction and assistance as possible. In Ontario, junior farmers' associations held four conferences in 1929 which were attended by delegates from the various zones. Definite, well-balanced programmes were planned and carried out during these conferences. Important problems concerned with the progress of junior-farmer activities, programme planning, methods of attacking economic problems, and similar topics were presented and solutions discussed.

UNION OF SOUTH AFRICA. The division of agricultural education and extension of the Department of Agriculture conducted extension

activities through extension officers located in various districts throughout the Union. They gave personal advice and instruction to farmers, established demonstration plots, held lecture meetings, and directed the activities of four schools of agriculture, which were extension centres in their respective areas. In January, 1930, additional home-economics officers were appointed to work with the women in each of the four schools of agriculture. They were specialists trained in domestic-science subjects. They visited farm women and gave advice about food preparation, hygiene, dressmaking, laundering, and other subjects of use and interest in the home. Camps for boys were held annually in Poteschefstroom and Pretoria. Tents and cooking utensils were lent by the military authorities. Teachers accompany the boys and act as supervisors. The objects of the camps were to instruct the boys in agriculture at a place truly rural in character.

SWEDEN. Agriculture advisers, paid by contributions from the government and from the agricultural societies, traveled about the country giving advice to farmers, conducting demonstrations, giving courses in general agriculture, bookkeeping, and household economics, and gathering statistics. Practical work with farm boys and girls made good progress. This work, which the Ministry of Agriculture in 1929 placed under the administration and guidance of the Jordbrukare-Ungdomens Forbund (Association of Farm Youth), was taking the form of competitions. Agricultural societies continued to show their interest through financial contributions and many firms and individuals presented prizes for the encouragement and support of the work. In 1929 there were 15,572 active members enrolled in 346 groups. The number of competitions increased from 154 in 1924 in which 1094 members took part to 654 in 1929 in which 4741 members participated. These competitions were held in 16 of the 20 counties in Sweden in 1929. Great interest was shown in root-crop growing, care of kitchen gardens, plowing, milking, potato and flax growing, women's institutes, and kindred subjects in addition to competitions, the farm-youth instructors and advisers during 1929 gave 1083 lectures, held 7640 meetings, and conducted 436 discussions and 226 study trips.

FINLAND. Official control of boys' and girls' club work was assumed by the Ministry of Agriculture in 1930. Club work was made a permanent part of the training for rural young people. The support which it has received from official and private courses showed the importance with which it was regarded by the government, by business interests, and by individuals. In 1930, there were 176 demonstration districts with 203 agricultural club agents, 42 home-economics agents, seven supervising agents, and 20,932 club members who completed their work. All club girls in 127 of the 176 districts were given instruction in the use of their home-grown products in the daily diet, baking, and canning. Livestock raising was conducted in 61 districts in which 677 club members participated in the courses.

NORWAY. Norwegian farm wives made considerable progress through the activities carried on by the Norsk Bondekvinneag (the Norwegian Countrywomen's Association). The objects of the association are to arouse the interest of farm wives in working for economic, cultural, and social improvement, to interest young people in ag-

riculture, and to combat the forces seeking to break down the Christian and moral life of the nation. The association sought to awaken interest among farm people in a national style of architecture, in restoring traditional peasant culture, in the care of the young, in the development of home industries on the farm, in the use of home-grown products, and the like.

Extension activities in agriculture and home economics were also carried on in the following countries: Argentina, Australia, Austria, Belgium, Brazil, British Guiana, China, Cypress, Czechoslovakia, Denmark, Ecuador, Estonia, France, Germany, Great Britain, Guatemala, Hungary, India, Italy, Jamaica, Mexico, Netherlands, New Zealand, Paraguay, Poland, Scotland, Soviet Union, Spain, Switzerland, and Uruguay.

**BIBLIOGRAPHY.** Consult Report on Coöperative Extension Work, 1930, issued by the U. S. Department of Agriculture; *History of Agricultural Extension Work, 1785-1923*, by A. C. True (U. S. Department of Agriculture, Miscellaneous Publication 15, 1928); *History of Agricultural Education, 1785-1925*, by A. C. True (U. S. Department of Agriculture, Miscellaneous Publication 36, 1929).

**AGRICULTURE.** The American farming industry had the benefits of a fairly productive season in 1931, but suffered from another precipitous decline in prices. The drought and reduced incomes made 1930 bad enough but 1931 was even worse. The problems of the year included huge existing surpluses of wheat, cotton, and other commodities, bumper crops, lack of demand and market, grasshoppers, and drought. The usual questions of credit, mortgages and unpaid bills, taxation and labor, already burdensome in themselves, were often aggravated by the general depression.

**AGRICULTURAL DEPRESSION.** The world-wide business depression was of unprecedented scope, duration, and intensity. American industries, as the Federal Farm Board viewed the situation, for the most part could meet the reduced demand by limiting output, whereas the very nature of farming prevented the farmers from promptly readjusting production, nor were farmers organized so as to make such changes. Agricultural production continued virtually unchanged and, indeed, total crop acreage and numbers of livestock registered increases. The purchasing power of domestic consumers fell sharply with the increasing unemployment, but taxes, wage rates, retail prices, etc., fell but slowly, and as a consequence, the purchasing power available for buying food and clothing was reduced still further, and industrial readjustments needed to correct unemployment were prolonged. Domestic consumption for most farm products could be maintained only by marked price reductions. Consumption of cotton and wool decreased in spite of lowered prices. As a result, the price depression bore down upon American farmers with exceptional severity. Besides, little or no reduction occurred in many cash payments, as taxes and interest, which farmers must meet. The low level of agricultural income during the year and the great unevenness between sections caused by the drought of 1930 were important factors in intensifying adverse business conditions.

The European demand for American farm products likewise was curtailed by rising unemployment and declining consumer purchasing

power. Increased tariffs in most European countries and widely adopted regulations requiring the use of a high percentage of domestic grain in milling operations both reduced foreign consumption of American products. The great increase in Russian exports tended to disorganize farm product markets, and further increase the difficulties of American exporters. An additional unsettling influence in international trade was the heavy depreciation of the foreign exchange values of the currencies of several countries.

Many new farm relief proposals were brought forward to cope with the situation. One group continued to recommend the equalization fee while another advocated the export debenture. A programme of price fixing and debt holidays for farmers were wanted by others. Conservative opinion was that measures designed to raise prices artificially were dangerous, tending to encourage further increases in supply, and in turn to bring only relatively lower prices. It was asserted that no price stabilization measure could produce permanently constructive results unless accompanied by a practical method for controlling crop production.

Recognizing the possibilities of adjusting the total volume of agricultural production by shifting land to uses yielding less product or out of agriculture altogether into forest, wood lot, and similar uses, Secretary of Agriculture Hyde indicated the urgent need of adjustment in the national agricultural policy, particularly the land policy. Acting with the Association of Land Grant Colleges and Universities, he called a national conference of farmers, bankers, economists, journalists, educators, public officials, and others to meet in Chicago, Nov. 19-21, to formulate a land-use programme. The National Land Use Committee created by the conference was to be a research and fact-finding body composed of experts from Federal departments and boards and the land-grant colleges. The National Advisory and Legislative Committee on Land Use, made up of representatives of farm, bank, commercial, and other organizations, was to advise the other committee and assist in directing legislative actions to carry out their findings. Looking definitely to the establishment of a rational land-use policy, the conference adopted recommendations dealing with the administration of the public domain, protection of the water shed and school lands, agricultural credit, outlook work, economic inventory of land resources and classification of soils, homesteads, taxation, land development, regional competition, reclamation, use of marginal land, public retention or acquisition of land, soil conservation, land classification, and regional land-utilization conferences.

**DROUGHT AND PESTS.** Heat and prolonged drought took a heavy toll of wheat in the spring wheat States and severely damaged cultivated crops and pastures, causing particular distress in parts of North Dakota and Montana, a section suffering heavily from crop failure in 1930. The government extended financial assistance to the stricken areas through credit corporations and relief loans to provide feed for livestock. In the areas of the South drought-stricken in 1930, the virtual end of emergency conditions was reported early in the spring of 1931 by Secretary of Agriculture Hyde who observed that the Red Cross had relieved the suffering, that Federal loans had enabled the farmers to start new crops and that frequent and heavy rains had

definitely ended the drought. These factors, he said, had developed a new spirit among the people of the areas which suffered most.

Grasshoppers caused the most notable insect damage during 1931, threatening the destruction of thousands of acres of crops in the Great Plains area of the West and doing their worst in central South Dakota and northern Nebraska. These insects, not migratory except locally and always present in the Great Plains area, increased tremendously in numbers because of conditions due to the droughts of 1929 and 1930 which favored the insects' growth but not diseases and other natural agencies normally checking grasshoppers. Timely preparation for control was expected to avoid a repetition of the year's experience.

**MODERN TRENDS IN FARMING.** Mechanization of agriculture continued to reduce production costs, often doubling or trebling the efficiency of the man, and in certain areas, it greatly increased the size of farms and investment per farm. Such machinery as the combine harvester-thresher, 2- and 4-row cultivators, mechanical corn pickers, usually tractor-drawn, by enabling the family labor supply to cover more land, had tended to conserve rather than to destroy the family farm system. While a few conspicuous developments in corporation and chain farming had taken place, the movement toward consolidation of holdings and toward farm operations on a large scale were not spectacular. The movement of farm products by motor truck has had a notable growth—enormous volumes of fresh fruit and vegetables, hogs, poultry, dairy products, cotton, timber, and grain being moved direct from the farm to distant markets. Concurrent with better production and marketing practices came improvement in the farm home, evident in more homes equipped with running water, sewerage disposal, and electricity.

**WORLD AGRICULTURE.** *China.* Large areas along the Yangtze River were damaged seriously by floods, and excessive rains in other sections were detrimental to crops, according to a report to the Department of Agriculture. Rice was principally affected but cotton along the Yangtze was also reported damaged and some stocks of wheat were lost in the flooded area. The rice crop in the Yangtze Valley and in southern China was reported to be much smaller than 1930 and not enough to supply the Shanghai market in 1932. The Chinese cotton crop was not expected to be larger than last year in spite of an increase of 10 to 15 per cent in acreage. Cotton growing sections near Hankow and Shanghai suffered greatly from the floods and heavy rain. In the important cotton growing region of Tungchow, damage to the cotton crop was reported to be as much as 20 per cent. The crop in the Tientsin area, outside the flooded district, probably would be considerably above 1930.

*Irish Free State.* Seventy thousand tenant farmers May 1 became absolute owners of their land through the new land act passed by the Dail, designed to speed up the process of transfer from landlord to tenant. This measure, the last of a long series of land-purchase acts, finally disposed of the old problems of land tenure and concluded a 50-year-old struggle begun by Michael Davitt to obtain the land for the people. The cost to the government, estimated at \$50,000,000, was to be met by an issue of land bonds.

*Rumania.* King Carol of Rumania adopted drastic measures to protect the peasantry from

usurious money lenders and speculators. Under a royal decree, peasants, who during the winter and spring sold futures on grain being harvested in 1931, might have their contracts declared void by depositing with the local law courts sums equivalent to the amounts received, plus 10 per cent interest. Speculators had been taking advantage of the peasants, now in almost a semi-starved condition, and had obtained full title to their harvests on payments of 15 or 20 per cent of the actual worth of the crops.

*U. S. S. R. (Russia.)* In March, 1931, approximately 10,000,000 peasants holdings, or 40 per cent of the total, were collectivized in Russia, and the movement did not promise to diminish soon. The collective farms rose from 82,276 in 1930 to 215,000 in 1931 and accounted for more than half of the total acreage planted in the spring of 1931. State farms numbered 4230 on June 30, and comprised 163,750,000 acres, compared with an area of about 100,000,000 acres in October, 1930, and about 22,500,000 acres were under cultivation.

*Bolivia.* The First Agricultural and Stock-raising Congress was opened on July 17, 1931, in the University of La Paz. Among its most important objectives were the organization of a national agricultural society, the foundation of an agricultural bank, and the organization of scientific agricultural and stock-raising services.

*Cuba.* The National Federation of Vegetable Growers and Exporters was organized in Cuba to obtain better transportation facilities for vegetables; to develop home and foreign markets; to seek favorable tariff agreements with countries consuming Cuban products; to work in cooperation with the Department of Agriculture; to give members the benefit of latest crop-growing methods; and in general to increase the vegetable production in Cuba. The federation was formed under the supervision of the Secretary of Agriculture, Commerce and Labor.

**WORLD WHEAT CONFERENCES.** The conference of wheat exporting countries held in London, England, May 18 to 23, consisting of delegations appointed by the United States, Argentina, Australia, Bulgaria, Canada, Hungary, India, Poland, Rumania, Union of Soviet Socialist Republics, and Yugoslavia, studied the existing world wheat situation, and signalized among the underlying causes for the prevailing depressed prices of wheat—the effects of the economic depression throughout the world, the fact that there was more wheat produced than could be sold at a profit, the absence of sufficiently adequate information regarding the movements of wheat, the requirements of certain countries and the quantities which were liable to be placed upon the market, and the prevailing uncertain state of the wheat markets throughout the entire civilized world.

The conference considered that, where possible, a reduction in the areas devoted to wheat should be undertaken in whatever way each country considers to be most effective and practical. It indicated the desirability of a careful exploration of all avenues for the greater utilization of wheat. The conference further considered that current information regarding the supply, the demand, and the movements of wheat should be brought together in such a way as to assist the wheat-exporting countries toward the orderly marketing of their surpluses, and suggested the establishment of a clearing house

for this information. Other world wheat conferences held on February 24 to 26, in Paris and in the last week in March, in Rome, did not reach agreement as to the solution of the world's wheat problems.

The Fifteenth International Congress of Agriculture held in Prague, Czechoslovakia, June 5 to 8, was attended by more than 100 official delegates, representing 30 countries, and more than 400 other participants. The congress was divided into sections, dealing with agrarian policy and rural economy, agricultural teaching and extension, agricultural coöperation, plant production, animal production, agricultural industries, and rural women. Much of the discussion centred on the world wheat crisis, with special reference to preferential treatment to grain from eastern European countries by western European countries. The export quota system also received attention.

The annual conference of the American Country Life Association for 1931, held at Cornell University, Ithaca, N. Y., August 17-20, had for its theme rural government, which was discussed in forums dealing with country organization and management, village and township government, taxation, public education, public health and welfare, and rural planning.

The Conference on Rural Hygiene, held at Geneva in July, summoned by the council of the League of Nations on the proposal of the Spanish government, had for its object an international technical study of rural hygiene, as one of the most important factors in the organization of European agricultural regions. The agenda adopted included guiding principles and appropriate methods for insuring effectual medical care in rural communes; the most effective methods of organizing health services in rural districts; and the amelioration of rural districts—most effective and most economical methods.

**THE AGRICULTURAL SITUATION.** The year 1931 was reasonably productive of crops in the United States, but was marked by another staggering decline in prices of farm products—a 44 per cent decline since 1929. The total crop production in 1931 was 10 per cent larger than in 1930, despite a reduction of 2.6 per cent in harvested acreage, thereby bringing production back to average following the poor yields of 1930. A total gross farm income of \$6,920,000,000 came from the farm production of 1931, or 26 per cent less than the \$9,300,000,000 from the production of 1930 and 42 per cent below 1929, according to estimates of the U. S. Department of Agriculture, which included the value of farm products sold and consumed in the farm home. The gross farm income for the United States probably about equaled the pre-war 1909-1913 average and was the lowest since 1911. Recent changes in gross farm income were held largely to be the result of the great price changes of the past two years associated with the economic depression.

The total value of the crops produced in the United States in 1931, based on December 1 farm prices, was estimated at \$4,123,000,000, or \$1,700,000,000 less than in 1930. Only about \$2,900,000,000 was derived directly from the sale and food consumption of crops, or about \$1,000,000,000 less than in 1930 and the income from livestock amounted to about \$4,000,000,000, or \$1,400,000,000 less than in 1930. Packers paid farmers \$1,103,000,000 for 10,834,000,000 pounds

of meat the first 10 months compared with \$1,533,000,000 for 10,759,000,000 pounds in the corresponding period of 1930. The combined total physical volume of crops and livestock sold or consumed in 1929 was about average, in 1930 about 2 per cent below, and in 1931 about 2 per cent above the average, whereas prices received for the crops and livestock of 1930 averaged about 22 per cent lower than for 1929 and the 1931 prices fell still further below the 1929 level.

The general status of agriculture near the end of 1931 could be illustrated in certain indexes cited by the U. S. Department of Agriculture. The wholesale price level of all commodities stood practically at pre-war or 100; the industrial wage level was roughly twice the pre-war figure, or 200; farm taxes exceeded 250; farm wages were about 120; prices of things bought by farmers 125; prices received by farmers for their products averaged about 70. The unit exchange value of farm products for other commodities was slightly over one-half what it was before the war.

The farm tax problem, serious before the depression began, became critical in 1931. Average taxes per acre on farm real estate declined slightly in 1930, as compared with 1929, the first decline in 17 years, yet because prices of farm products and values of farm real estate had gone down more than taxes in the year, farm real estate taxes were relatively higher than in the year before. In 1913 the average farm tax rate was 68 cents on \$100 of full valuation, i. e., the probable market value of the land, in 1924 \$1.22, and 1929 \$1.46. Because of the 8 per cent decline in land values, taxes in 1930 materially exceeded \$1.50 on \$100 of full valuation.

The farm-tax problem mainly rests with State and local governments, which in many instances have recognized the fact in practical ways. Forty-four State legislatures met during the year, and most of them considered taxation in relation to agriculture. Relief measures advocated, and in some cases enacted, were those designed to shift part of the cost of State and local government from general property, principally on real estate, to incomes and other sources of revenue, and those designed to reduce public expenditures. The policy of relieving local communities from some of the cost of schools and highways has advanced rapidly.

Farm real estate values, reflecting developments unfavorable to agriculture in the previous year, continued to decline in nearly all parts of the country. The acre value for all farm lands with improvements, averaged for the whole country, decreased from 115 per cent of the pre-war value to 106 per cent, during the year ended Mar. 1, 1931 compared with a 1 per cent drop in the year before. The fundamental cause of the decline in property values in 1930 was the slump in farm incomes. In average value, the land and buildings of farms in the United States fell from \$10,284 per farm in 1920 to \$7614 in 1930, and from \$59.38 per acre in 1920 to \$48.52 in 1930, according to the Census Bureau's 1930 farm census. The value of farm land and buildings declined from \$60,316,002,002 in 1920 to \$47,879,838,358 in 1930. The land alone was valued at \$54,829,563,059 in 1920 and \$34,929,844,584 in 1930. The number of farms fell from 6,448,343 in 1920 to 6,288,648 in 1930. The farm acreage increased from 955,883,715 in 1920 to

986,771,016 in 1930. Farm implements and machinery were valued at \$3,594,772,928 in 1920 and \$3,301,663,482 in 1930.

Voluntary sales and trades of farm realty were 19 per 1000 in the year ended Mar. 15, 1931, versus 23.7 in 1930, whereas forced transfers rose from 20.8 per 1000 in 1930 to 26.1 in 1931. Concurrently came a significant increase in the proportion of tenant-operated farms, which was 42.4 per cent in 1930 for the United States as a whole as compared with 38.6 per cent in 1925, and was reported in every State except Arizona and six Atlantic Coast States.

Agricultural credit conditions generally were extremely unsatisfactory, notwithstanding the important Federal legislation affecting agricultural credit put in effect during the last 15 years. This, as viewed by the U. S. Department of Agriculture was not wholly a reflection upon existing farm credit facilities, but was largely the result of the depressed condition of agriculture which weakened banking institutions. Local farm-credit facilities, barely adequate in normal times, were not prepared to handle the situation resulting from the 1930 drought and recent depression in farm prices. Accordingly, Congress passed legislation to supplement existing credit facilities and appropriated emergency funds, including \$45,000,000 for loans to farmers suffering from the 1930 drought, for the purchase of seed, feed, and fertilizer, \$2,000,000 for these purposes in a specific area suffering from storm and flood in 1929, \$20,000,000 for agricultural rehabilitation and for loans to individuals to buy stock in agricultural-credit corporations, livestock-loan companies and similar organizations.

Discussing credit and relief measures, President Hoover in his message to Congress, Dec. 8, 1931, stated:

To meet the emergencies in agriculture the loans authorized by Congress for rehabilitation in the drought areas have enabled farmers to produce abundant crops in those districts. . . . The action of the Federal Farm Board in granting credits to farm cooperatives saved many of them from bankruptcy and increased their purpose and strength. By enabling farm cooperatives to cushion the fall in prices of farm products in 1930 and 1931, the board secured higher prices to the farmer than would have been obtained otherwise, although the benefits of this action were partially defeated by continued world overproduction. Incident to this action the failure of a large number of farmers and of country banks was averted which could quite possibly have spread into a major disaster. The banks in the South have cooperated with the Farm Board in creation of a pool for the better marketing of accumulated cotton. Growers have been materially assisted by this action. Constant effort has been made to reduce overproduction in relief of agriculture and to promote the foreign buying of agricultural products by sustaining economic stability abroad.

Farm mortgage activities continued to be characterized by a conservative lending policy. Lower land values and falling prices of farm products induced restriction of amounts in new loans and a scaling down of amounts granted on renewals. As a consequence there was a reduction in the total farm mortgage holdings of the principal lending agencies. Farm mortgage loans by 40 life insurance companies aggregated Aug. 31, 1931, \$1,533,000,000, a progressive decline from \$1,618,000,000, Dec. 31, 1927; by Federal Land Banks \$1,171,000,000, Oct. 31, 1931 versus \$1,197,000,000, Dec. 31, 1929; Joint Stock Land Banks \$540,000,000, Oct. 31, 1931 versus \$667,000,000, Dec. 13, 1927; banks of Federal Reserve System \$389,000,000, June 30, 1931 versus

\$489,000,000, June 30, 1926; by Federal Intermediate Credit Banks—production and marketing loans for farmers' cooperative associations, \$47,027,000 and to financing agencies \$78,470,000 in October, 1931 versus \$62,984,000 and \$63,119,000 in October, 1930.

As the United States produces less for export, Secretary of Agriculture Hyde pointed out in his report, the tariff on agricultural products will become more effective. Agriculture will benefit by sharing in the results of a better adjustment of world production to world demand and by having a stronger, more sheltered domestic market.

The value of exports of agriculture commodities in the fiscal year ended June 30, 1931, amounted to \$1,038,000,000, or \$457,867,000 less than in the preceding year, and was the lowest since 1911. The percentage of agricultural products exported declined from 12.2 in 1928-29 to 10.2 in 1929-30, and probably declined more in 1930-31. Cotton suffered most from the reduction in foreign demand, although exports of meat and meat products, canned vegetables, and vegetable oils were reduced greatly. The volume of wheat and flour exports were 14 per cent and the value 38 per cent less than the previous season, whereas exports of leaf tobacco declined only slightly, and the exports of fresh and dried fruits rose considerably. Imports of agricultural products, reduced in volume and value, amounted to \$1,067,000,000, a decrease of 37 per cent from the preceding year. More coffee and tobacco were imported but values were less, imports of animal products were much lower in volume and value, and imports of sugar, tea, and vegetable oils were lower in value.

The farm population in the United States showed an increase, the first in two decades, being estimated from U. S. Department of Agriculture surveys, as of Jan. 1, 1931 at 27,430,000 as against 27,222,000 on Jan. 1, 1930. The movement to towns and cities comprised 1,543,000 in 1930, while 1,392,000 persons went from cities to farms. Balancing these movements and births and deaths left a net gain of 208,000 persons in farm population. The Census Bureau reported that on Apr. 1, 1930, the farm population was 30,447,550 or 24.8 per cent of the total population and the non-farm population living in rural territory 23,662,710. The population of the country increased 16.1 per cent between 1920 and 1930, but the farm population decreased 3.8 per cent, while the rural non-farm population increased 18 per cent.

CROP PRODUCTION IN 1931. The area of all crops harvested in the United States in 1931, exclusive of fruits, was estimated to be 350,672,000 acres, 2.6 per cent less than was harvested in 1930. This reduction was due to the decrease of more than 13,000,000 acres from drought and crop failures in California and five States in the northern great plains; acreages were higher in most parts of the country. While the United States in 1931 produced large crops of cotton, tobacco, and winter wheat, and short crops of hay, spring wheat, and flaxseed, there were no pronounced deficits or surpluses of the other staple crops. Apples and peaches were produced in abundance. Ample winter and early spring rains, followed by a dry growing season, were ideal for winter wheat, cotton, and tobacco. Although crops with large acreages in the West suffered greatly in the area drought stricken in 1930, only Montana, Wyoming, and western

North Dakota suffered again in 1931. There was abundant rain in the Ohio-Mississippi River area.

The value of the 1931 crops in the United States was estimated to be \$4,122,850,000 compared with \$5,818,820,000 in 1930, and \$8,088,494,000 in 1929. The percentage of decline was rather uniform in all parts of the country, but very heavy in the Dakotas, due to drought in 1931. The reductions in value were due primarily to the decline in prices and were shared by practically all crops being \$1,043,000,000 in corn, \$854,000,000 in cotton and cottonseed, \$446,000,000 in wheat, \$388,000,000 in hay, \$263,000,000 in potatoes, \$220,000,000 in oats, and \$130,000,000 in tobacco, and proportional decreases in less important crops.

The wheat crop of the United States was estimated at 892,271,000 bushels from 54,949,000 acres, an increase of 4 per cent in production from 6,189,000 fewer acres than in 1930. Based on the farm price reported December 1, 44.3 cents per bushel, the total value of the 1931 crop was \$395,600,000 compared with 60 cents and \$514,847,000 in 1930. The areas harvested and the total production were for winter wheat 41,009,000 acres, 787,465,000 bushels; durum 2,869,000 acres, 18,395,000 bushels; and other spring wheat 11,071,000 acres, 86,411,000 bushels.

Official estimates of 1931 wheat production for 41 countries which produce about 95 per cent of the world wheat crop, exclusive of Russia and China, totaled 3,542,684,000 bushels compared with 3,635,025,000 in 1930. The Canadian crop totaled 304,144,000 bushels, 93,728,000 less than that of the previous year. The 1931 production in 28 European countries was reported at 1,422,066,000 bushels compared with 1,366,692,000 bushels in 1930. See WHEAT.

The 1931 corn crop estimated at 2,557,000,000 bushels exceeded the 1930 crop by 24 per cent and the 1929 crop by 1 per cent. Acre yields in 1931 were materially higher in the area affected by the drought in 1930, but lower in the western States. Hot dry weather affected the crop adversely in five midwestern States and grasshopper damage also was a factor in part of this area. The acreage totaled 104,970,000, 4.2 per cent greater than in 1930, and the acre yield averaged 24.4 bushels, compared with 20.4 in 1930. Production of corn for grain was estimated at 2,200,000,000 bushels, and for fodder, hogging, and grazing, 11,626,000 acres. Corn production in 18 foreign countries amounted to 808,238,000 bushels, nearly 13 per cent more than their 1930 harvest. Nine European countries reported a total of 649,280,000 bushels, 16.7 per cent over 1930. See CORN.

The oats crop of 1931, was estimated to be 1,112,142,000 bushels, and harvested from 39,722,000 acres, compared with 1,277,764,000 bushels in 1930 from about the same area. The yield per acre averaged 28 bushels, 4 bushels less than in 1930. Oats production in 31 countries accounting in 1930 for about 94 per cent of the world total, excluding Russia and China, amounted to 3,157,051,000 bushels, 7 per cent less than in the previous year, and that of 24 European countries 1,610,393,000 bushels versus 1,588,072,000 in 1930. See OATS.

Barley production in 1931 was estimated at 198,965,000 bushels raised on 11,471,000 acres averaging 17.3 bushels per acre compared with

304,601,000 bushels on 12,662,000 acres averaging 24.1 bushels in 1930. The smaller production was in northern and western States, a consequence of reduced plantings due to moisture shortage, yields lowered by heat and drought, and more than the usual acreage cut for hay. The barley crop in 37 countries was reported to be 1,168,199,000 bushels, nearly 16 per cent below their 1930 production. The 25 European countries reporting showed a total of 649,639,000 bushels, 7.9 per cent less than in the previous year. See BARLEY.

The rye crop declined to 32,740,000 bushels on 3,143,000 acres in 1931 from 45,379,000 bushels on 3,543,000 acres in 1930. It averaged 10.4 bushels per acre in 1931 and 12.8 in 1930. Drought conditions in the northwestern States greatly reduced the harvested acreage. The 1931 rye crop in 24 reporting countries, accounting for about 96 per cent of the world production, except Russia and China, was estimated to total 797,259,000 bushels against 975,728,000 in 1930. Buckwheat production totaled 8,875,000 bushels from 502,000 acres, about 27 per cent over 1930, although on 71,000 fewer acres. Rice made 45,014,000 bushels, with small increases in yield and acreage over 1930. See RYE, RICE.

Total production of flaxseed in 1931 was 11,018,000 bushels from 2,313,000 acres as compared with 21,240,000 bushels and 3,047,000 acres in 1930, the reduction in yield and acreage being due to severe summer drought. Feterita, kafir, milo, and other grain sorghums produced an estimated equivalent of 104,529,000 bushels from 7,152,000 acres; a substantial increase in acreage was accompanied by good acre yields. Production of threshed or headed grain sorghums was 69,558,000 bushels, and of forage 3,533,000 tons. Broomcorn production was 47,900 tons from 309,000 acres.

Production of sorghum (sorgo) sirup amounted to 17,818,000 gallons, sugar cane sirup, 14,859,000 gallons, maple sugar 1,653,000 pounds, and maple sirup, 2,517,000 gallons. Sugar made from the sugar beet crop of 1931 was estimated at 7,933,000 tons from 720,000 acres against 9,199,000 tons from 775,000 acres in 1930. About the usual acreage of sugar cane in Louisiana was expected to produce 156,000 tons of sugar compared with 184,000 in 1930. See SUGAR.

The total hay crop, one of the shortest in years, largely due to drought, was estimated at 72,366,000 tons, of which tame hay made up 64,233,000 tons and native or wild grasses 8,133,000 tons. The totals included alfalfa, 20,914,000 tons; clover and timothy, 27,594,000 tons; sweet clover, 765,000 tons; lespedeza, 384,000 tons; annual legume hay, 4,420,000 tons; grain hay, 4,645,000; sweet sorghum forage, 3,676,000 tons; and other hay crops, 5,511,000 tons. Larger yields of timothy seed and lespedeza seed and smaller crops of seed of alfalfa, red and alsike clover, and sweet clover were reported in 1931. See HAY.

The potato crop was estimated at 376,248,000 bushels compared with 333,210,000 bushels in 1930; the average yield per acre 111.3 bushels was slightly higher but the farm valuation \$161,264,000, was 45 per cent below that of 1930 and 62 per cent less than in 1929. The Canadian crop was reported to be 87,172,000 bushels. Estimated production in 17 European countries producing about 75 to 80 per cent of the Euro-

PRODUCTION BY COUNTRIES IN 1930 AND 1931 OF WHEAT, RYE, OATS, BARLEY, AND MAIZE (CORN) IN BUSHELS\*

\* The production given countries in the Southern Hemisphere is for the crop years 1930-31 and 1929-30; also for maize production in British India.

pean crop, exclusive of U.S.S.R. (Russia) was 3,805,000,000 bushels compared with 3,914,000,000 bushels in 1930. The acreage under potatoes in the U.S.S.R. was reported at 14,838,000 in 1931 versus 14,378,000 in 1930. The sweet potato crop was estimated to be 62,904,000 bushels, and the peanuts harvested for picking or threshing at 1,083,110,000 pounds. See **POTATOES**.

Tobacco production in 1931 was 1,610,098,000 pounds from 2,019,000 acres, 1.5 per cent less than the record crop of 1930, and on an acreage less than 4 per cent smaller. There were increases in the production of the fire-cured class which was estimated to comprise 197,267,000 pounds of the total, Burley, 464,955,000 pounds, Southern Maryland 31,540,000 pounds, and dark air-cured 71,657,000 pounds, whereas flue-cured, the class ranking first in importance, produced 657,715,000 pounds, about 23.9 per cent less than in 1930. The production of cigar filler, 91,857,000 pounds, was higher than in 1930, while in the cigar binder class with 84,873,000 pounds, and cigar wrapper 8,794,000 pounds, production was lower. Farm prices reported December 1, averaged 9.7 cents a pound compared with 12.9 cents in 1930. See **TOBACCO**.

The cotton crop of the United States, according to December 1 estimates, was 16,918,000 bales, the second largest ever produced in the United States, and 2,986,000 more than in 1930 and the cotton was harvested from 40,495,000 acres compared with 45,091,000 acres in 1930. The yield of lint per acre averaged 200.1 pounds in 1931 and 147.7 in 1930. The 1931 season was extraordinarily favorable for the production of cotton, in regard to planting conditions, weevil infestation, growth, maturity, and harvest conditions. Exports of cotton during the cotton year ended July 31, 1931, totaled 6,759,927 bales compared with 6,689,796 in the previous year. France and Japan were the only major consuming countries increasing their imports. The producer received an average of 5.7 cents per pound for cotton lint on December 1, 1931, compared to 9.5 cents in 1930. See **COTTON**, and articles on other individual crops.

**FEDERAL FARM BOARD.** The board in spite of unfavorable economic conditions, during the two and one-half years of its existence, continued to make substantial progress toward the main objective of the Agricultural Marketing Act of 1929,—the development of a national programme of improved marketing and production adjustment for the permanent betterment of American agriculture. The board's major activities, as in its first year, were directed toward aiding farmers as far as possible to carry forward the co-operative movement on a sound basis. Emergency efforts to protect wheat and cotton growers from threatened collapse of the markets for these commodities were continued for the benefit of the farmers and the country as a whole.

**Coöperative Marketing.** Major efforts were centred on strengthening and expanding existing coöperatives and unifying their sales activities. The six active national coöperative sales agencies dealt in grain, cotton, livestock, wool and mohair, pecans, and fruits and vegetables. There were many regional and State associations formed for dairy products, poultry products, fruits and vegetables, potatoes, beans, sugar beets, and other products.

The 11,950 coöperative associations operating during the fiscal year 1930-31 had an active mem-

bership estimated to include over 2,000,000 different farmers. The total business transacted by coöperative associations in 1930-31 was \$2,400,000,000, of which \$130,000,000 represented the sale of cotton and cotton products; dairy products \$620,000,000; forage crops \$1,200,000; fruits, vegetables and nuts, \$332,000,000; grains, \$621,000,000; livestock, \$300,000,000; poultry and poultry products, \$86,000,000; tobacco, \$7,000,000; wool and mohair, \$26,000,000; miscellaneous commodities \$61,800,000; and purchase of supplies, \$215,000,000. Since 1927-28 the number of associations increased approximately 500, and the volume of business they handled increased in value by \$100,000,000, in spite of the lower prices.

As examples of the volume handled by the national coöperative marketing agencies, Farmers National Grain Corporation, with 27 regional members serving 250,000 farmers, handled about 196,000,000 bushels of grain in terminal markets; the American Cotton Coöperative Association and Staple Cotton Coöperative Association, with combined memberships of more than 160,000, handled 2,442,001 bales; National Wool Marketing Corporation, serving 40,000 wool and mohair growers, handled 130,349,499 pounds; and the National Livestock Marketing Association, serving 300,000 producers, handled more than 8,000,000 head of livestock.

Up to June 30, 1931, the board made loans from the 500,000,000 revolving fund to 105 co-operative associations with which were affiliated nearly 3325 regional or local associations having 1,110,000 members or approximately 730,000 individual farmers. Such loans amounted to \$255,866,458, of which \$146,367,203 had been repaid. Up to November 1, loans, exclusive of stabilization operations, had been made to associations in the amount of about \$326,000,000, of which about \$175,000,000 was repaid. Besides direct loans the board assisted coöperatives by organization surveys, by aid in improving methods of operation and management, in maintaining sound relations with members, in developing sound sales policies, and in improving the quality of services rendered.

**Stabilization Operations.** The stabilization operations in grain and cotton, undertaken as emergency measures, did much to cushion the decline of agricultural prices and to prevent the demoralization of business in the rural sections of the country. Wheat stabilization activities, made necessary by the acute situation, the board reported, sustained American prices well above world markets for six months, added millions of dollars to farmers' incomes, and gave farmers and business organizations a breathing spell in which to readjust to a lower level of prices. Cotton prices, supported through loans to co-operatives and the withholding from the market of stabilization stocks acquired the previous year, were sustained through the marketing year higher than they otherwise would have been, to the benefit of cotton growers and the nation. The downward trend in business conditions of the fiscal year 1930-1931 made stabilization operations unusually hazardous and reduced the possibility of conducting such operations without incurring losses.

Purchases of wheat up to June 30, 1931, by the Grain Stabilization Corporation totaled 329,641,052 bushels at a cost of \$270,204,303.78, or an average of 81.97 cents a bushel. Sales for export, milling, and other purposes left 257,136,571

bushels, June 30, 1931. Up to Nov. 1, sales were made to Brazil, 25,000,000 bushels (in exchange for 1,050,000 bags of coffee); to China, 15,000,000 bushels, and to Germany, 7,500,000 bushels, and in addition, sales in regular trade channels nearly equaled the 5,000,000 bushel monthly cumulative maximum. Unsold wheat owned by the corporation on November 1, totaled 189,656,187 bushels, worth at current prices, about \$120,000,000.

Up to June 30, 1931, the Cotton Stabilization Corporation had purchased 1,319,809 bales of cotton at a cost of \$107,533,246, or an average purchase price of \$81.48 per bale, or 16.3 cents per pound. Net sales for all purposes left 1,310,789 bales owned on June 30, 1931. This cotton, still on hand Nov. 1, 1931 was estimated to be worth about \$45,000,000 at current prices. The banks of the cotton-producing States agreed in October to make or renew loans to mature not earlier than July 31, 1932, secured by cotton totaling at least 3,500,000 bales. The board agreed not to call the obligation of the cotton co-operatives, covering about 2,000,000 bales, unless such cotton could be sold at more than 12.5 cents per pound before July 31, 1932, and that the Cotton Stabilization Corporation would maintain its backlog of approximately 1,300,000 bales until July 31, 1932, on the same terms. In addition, the board agreed to extend these commitments to July 31, 1933, if cotton acreage was substantially reduced in 1932.

That there were rigorous limits as to what stabilization operations could accomplish, was recognized by the board. Successful stabilization means keeping prices from going unduly low in periods of large supplies or poor demand and from becoming unduly high during periods of short supplies or of inflation. Prices cannot be kept artificially high over long periods by such methods. The experience of the two years showed the futility of engaging in stabilization purchases for any product over a period of years in the face of constantly accumulating surplus. Stabilization involves selling as well as buying. Permanently holding the price higher than it would be otherwise cannot be done without control of production. The board's experience showed that with the existing organizations and legislation it was not yet possible to control agricultural production.

**Other Activities.** In efforts to aid orderly production the board during the year urged reduction of acreage of particular crops for which an excess acreage was indicated in the coming year; collaborated with the U. S. Department of Agriculture and State agricultural colleges in their agricultural outlook service; and analyzed the possibilities of reducing agricultural output by measures designed to transfer land from agricultural to other uses.

Close cooperation was maintained with the U. S. Department of Agriculture, Federal Board for Vocational Education, and with the State colleges of agriculture and vocational teachers. Where their resources were inadequate for certain needs, as in special personnel, more complete market data on certain products, and research in the broad field of marketing, the board instead of setting up a parallel service, advised enlargement of the facilities of the other institutions. Advisory committees established by co-operatives for cotton, dairy products, wheat, coarse grains, livestock, wool and mohair, and

sugar beets and sugar cane, advised the board with respect to problems touching their particular commodities. A number of State coöperative councils created during the year made possible periodical State conferences of representatives of coöperatives and of the various agencies interested in developing the coöperative organization programme.

The membership of the board at the end of 1931 included J. C. Stone (Chairman), Ky.; Carl Williams, Okla.; C. B. Denman, Mo.; C. S. Wilson, N. Y.; W. F. Schilling, Minn.; S. H. Thompson, Ill.; Frank Evans, Utah; and Secretary of Agriculture A. M. Hyde, member ex-officio. **AGRICULTURE, U. S. DEPARTMENT OF.** The U. S. Department of Agriculture during the fiscal year ended June 30, 1931, continued in full force its activities along the three principal lines of research, regulation, and extension. The classification of the Department's work under these three heads is reflected in its general organization which includes a director of scientific work, a director of regulatory work, and a director of extension work in charge respectively of scientific research and discovery, of the police powers of the Department in the enforcement of regulatory laws and of the extension service charged mainly with disseminating and bringing into use information applicable on the farm and in the farm home.

The report of the Secretary of Agriculture for the year described the regular lines of work of the Department and the activities demanded to meet emergencies and reviewed the agricultural situation within the country as well as in its world-wide aspects. World influences on American Agriculture, home market and farm incomes, crop adjustments, and the conditions surrounding the various branches of crop and livestock production were discussed. Attention was given also to drouth relief, exports and imports, the value of farm lands and their right utilization, farm taxation and agricultural credit, changes in the farm population, the national forests, and other subjects of agricultural and national importance.

For assistance to farmers in the drouth stricken areas of 1930 the Department administered a fund of \$57,000,000. Approximately \$47,000,000 of this amount was borrowed by more than 385,000 applicants for the purchase of seed, fertilizer, feed for livestock and other farm needs. These loans made in 1646 counties in 31 States were handled through field offices in Washington, D. C., Memphis, Tenn.; Fort Worth, Texas; St. Louis, Mo.; and Grand Forks, N. D. Through the extension forces supplies of feed and forage were located and the railroads granted reduced freight rates on shipments of hay, feed, and water to the drouth sufferers and on the outward movement of livestock from such areas. Through the agricultural organizations help was extended to farmers in the use of the money borrowed and in the utilization of the resources within their reach. Advice was given in the planting of fall gardens and of forage crops for fall and spring pastures and in the preserving of food supplies that were available. Further assistance was rendered in making crop adjustments with greater provision for feed and food and with better adaptation to market requirements.

The Department of Agriculture was authorized also to extend unemployment relief through the expenditure of additional funds appropriated by Congress for Department activities and the use of appropriations before they were to become available. In this way increased funds were provided for the construction of State highways and of roads and trails in the national forests. Employment was given also in the repair, construction, and improvement of equipment used in the Department's research and service work. Over \$100,000,000 was appropriated with a view to relieving unemployment and for varying

periods work was provided for nearly 200,000 men who were needing immediate employment.

The efforts to reduce unemployment advanced the Federal-aid road construction programme to a marked extent. The Federal-aid funds used for the purpose during the year reached the sum of \$133,340,910.64 or more than was ever paid to the States in this connection in a single year. It was estimated that during the latter half of the fiscal year about 300,000 men were occupied directly and indirectly in the road-building work in which the Department through the Bureau of Public Roads took part. During the fiscal year Federal-aid improvement was completed on 11,033 miles of road including 7939 miles receiving Federal-aid improvement for the first time, 3082 miles to which a further degree of betterment was added and 12 miles reconstructed. The total cost of this work was \$255,088,414.09 including a Federal contribution of \$105,918,451.14, the rest coming from the States. At the close of the fiscal year work was in progress on 16,481 miles of road of which 12,306 miles were receiving Federal aid for the first time. The total completed mileage improved with Federal aid up to date was reported as 88,713 miles including nearly 390 miles of bridges over 20 feet in span and their immediate approaches.

The more important changes on the Department's staff of workers during the fiscal year included the appointments of Henry A. Nelson as chief of the new Division of Operation of the Office of the Secretary, of Frank H. Spencer, assistant to the Secretary, as chief of the Division of Administration, Bureau of Entomology, and of S. A. Rohwer, assistant chief of the Plant Quarantine and Control Administration, as assistant chief of the Bureau of Entomology. At the close of the year the Division of Agricultural Engineering of the Bureau of Public Roads became the Bureau of Agricultural Engineering and S. H. McCrory, for many years head of the division, was appointed chief of the new bureau.

At this time also Dr. L. O. Howard, chief of the Bureau of Entomology from 1894 to 1927 and since then member of the Department's scientific staff, retired from the Government service. Dr. Howard was the recipient in 1931 of the Capper award for outstanding service to agriculture, established by Senator Capper of Kansas and consisting of a gold medal and five thousand dollars. Since the close of the year Avery S. Hoyt formerly director of agriculture in California was appointed assistant chief of the Plant Quarantine and Control Administration, J. T. Jardine, director of the Oregon Agricultural Experiment Station, entered upon the position of chief of the Office of Experiment Stations and Asher Holson in charge of the Foreign Agricultural Service Division of the Bureau of Agricultural Economics resigned to become professor of agricultural economics at the University of Wisconsin. On Aug. 6, 1931 occurred the death of Dr. Russell A. Oakley in charge of the Division of Forage Crops and Diseases of the Bureau of Plant Industry. Dr. Adrian J. Pieters of the same division was appointed to fill the vacancy.

During the fiscal year ended June 30, 1931, the Department of Agriculture expended a total of \$313,543,238. Of this amount \$21,812,529 was used for research, \$11,344,478 for extension, \$14,131,333 for eradication or control of crop and animal pests, \$11,961,027 for regulatory work, \$74,181,856 for service activities and \$180,112,-

015 for road construction. Over 80 per cent of the expenditures were devoted to service work and the building of roads.

**AIRCRAFT CARRIERS.** See NAVAL PROGRESSES.

**AIRPLANES, AIR RECORDS, AIRSHIPS,** etc. See AERONAUTICS.

**AIRPORTS.** See AERONAUTICS; PORTS AND HARBORS.

**AKRON, THE UNIVERSITY OF.** A coeducational institution of higher learning in Akron, Ohio, founded in 1870 as Buchtel College and taken over by the city and renamed in 1914. The enrollment for the summer session of 1931 was 419 students and for the autumn day session, 1183 students, distributed as follows: College of liberal arts, 491; home economics department of liberal arts, 29; teachers college, 259; college of engineering and commerce, 404; 985 students were enrolled in the autumn evening session. There were 84 faculty members. The amount of endowment was \$72,922 and the income for the year, including tax levy from the city, \$428,732. There were 32,224 volumes in the library. Among the important gifts received during the year was \$175,000 from the Daniel Guggenheim Fund for the Promotion of Aeronautics for an airship research institute. President, George Frederick Zook, Ph.D.

**ALABAMA. POPULATION.** According to the Fifteenth Census the population of the State on April 1, 1930, was 2,646,248, as against 2,348,174 in 1920. For 1930, the number of native whites was 1,685,065; it had been 1,429,370 for 1920. The number of Negroes, 944,834 for 1930, revealed a less rapid increase, from 900,652 for 1920. The small foreign-born white population declined to 15,710 for 1930, from 17,662 for 1920. Birmingham, the chief city, had 259,678 inhabitants in 1930; 178,806 in 1920. Mobile had 68,202 in 1930; 60,777 in 1920. The capital, Montgomery, had 66,079 in 1930; 43,464 in 1920. Of the population, 772,281 males and 254,014 females were engaged in all occupations. As farmers were occupied 235,005 males and 17,255 females; as wage workers on farms, 63,181 males and 16,922 females; as unpaid family workers on farms, 88,887 males and 70,245 females. Factory operatives numbered 30,836 males and 16,161 females; factory laborers, 51,366 males and 2,168 females. There were 23,965 coal-mine workers. Of all those listed as gainfully employed, 31,565 were of age from 10 to 13 years, inclusive.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops for 1931 and 1930:

Crop	Year	Acreage	Prod. Bu.	Value
Cotton ...	1931	3,420,000	1,430,000*	.....
	1930	3,770,000	1,478,000*	.....
	1931	3,101,000	43,414,000	\$17,800,000
Corn .....	1931	2,819,000	29,600,000	28,416,000
	1930	615,000	477,000*	4,293,000
	1930	432,000	806,000*	4,621,000
Hay, tame ..	1931	78,000	5,304,000	3,448,000
	1930	68,000	5,780,000	4,913,000
	1931	382,000	229,200,000*	3,438,000
Peanuts ..	1930	864,000	218,400,000*	6,115,000
	1931	39,000	3,666,000	2,566,000
	1930	28,000	2,184,000	3,167,000
Potatoes ..	1931	153,000	3,366,000	1,313,000
	1930	90,000	1,440,000	922,000

\* Bales.    \* Tons.    \* Pounds.

**MINERAL PRODUCTION.** The production of coal, normally supplying the greater part of the State's mineral yield, was much curtailed in 1930, attaining only to 15,570,058 short tons as against 17,943,923 tons (1929); in value \$31,616,000 was mined in 1930 and \$37,309,000 was mined in 1929. The production of coke, being even more sharply reduced in proportion to total, accounted for much of the decline in coal. Coke produced in the by-product ovens totaled 3,986,920 short tons for 1930, as against 4,753,967 for 1929; in value, it attained \$10,741,937 for 1930 and \$12,659,148 for 1929. The State's production of iron ore fell off conformably to 5,636,678 long tons for 1930, from 6,637,299 for 1929; in value it diminished to \$11,015,336 for 1930, from \$12,575,113 for 1929. The State's shipments of pig iron were 2,294,513 long tons for 1930, as against 2,697,814 for 1929, while the value of these shipments, \$31,083,005 for 1930, was greatly below the \$43,674,910 of 1929. Shipments of Portland cement totaled 4,689,516 barrels for 1930 and 5,228,947 for 1929; the total value of the shipments was more nearly maintained, being \$5,829,818 for 1930 and \$5,911,031 for 1929. There were produced, of lime, 174,000 short tons in 1930 and 209,260 in 1929; by value, \$937,000 in 1930 and \$1,223,623 in 1929. Clay products totaled \$4,001,633 for 1929 (\$4,072,802 for 1928). Stone was quarried in 1929 to the quantity of 1,262,120 short tons, in value \$2,249,601. The total value of the State's mineral product was \$65,402,354 for 1929; for 1928, \$69,807,334.

**MANUFACTURES.** Federal Census data obtained in 1930 and covering 1929 gave the number of manufacturing establishments in the State as 2848. These employed 120,064 wage earners, to whom wages of \$102,040,108 were paid. The number of the wage earners was less than 1 per cent above that for 1927, while the total of wages paid was some 3 per cent less. The materials used in production in 1929 cost \$258,071,960; fuel and purchased electricity, \$41,447,011. The manufactured products of 1929 were valued at \$560,974,640, which was about \$10,600,000 above the corresponding total for 1927. Value added by manufacture was estimated for 1929 as \$261,445,660. Birmingham had in 1929 318 establishments, employing 18,318 wage earners, to whom were paid \$21,505,390; its manufactured product was valued (1929) at \$137,101,685.

**FINANCE.** As stated by the U. S. Department of Commerce, the expenditures of Alabama in the year ended Sept. 30, 1930, were \$35,533,321; revenue, \$30,275,999; debt outstanding at close of year, \$67,684,845; year's direct State tax levy, \$8,044,397.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1931, was 5249.20. This was less by 8.35 miles than the total of a year before. No new trackage was reported to have been built in 1931.

**EDUCATION.** For 1930 the number of persons of school age in the State was reported as 875,576. There were in that year 622,988 enrolled pupils. Of these, 500,653 were in grades from the first to the sixth, inclusive. In grades from the seventh to the twelfth, inclusive, were 122,335. The total expenditure for public-school education in 1930 was \$22,654,507. Salaries of teachers averaged, by the year, \$628 for the elementary grades, \$1101 for the high schools, and \$761 for both groups. The figures above all related to education for the colored as well as the whites.

The system of State aid for public schools was subjected during the legislative session of 1931 to efforts to reduce the amount of aid in the interest of retrenchment, but reductions were small.

**LEGISLATION.** The sixty-seventh regular session of the State Legislature convened in January and adjourned finally on July 26, having been extended by intermediate adjournment. It dealt with a large and troublesome deficit in the State finances by voting a proposal for a constitutional amendment to authorize the issuance of \$15,000,000 in State warrants, redeemable in 20 years. A further proposed constitutional amendment, to be submitted to popular vote for ratification at the autumn election, was voted, calling for the termination of the State ad valorem tax and the creation, in its place, of a tax on net incomes, at rates not less than 1 per cent nor more than 10 per cent. The rate of the impost on sales of gasoline was raised by statute to 5 cents a gallon, from 4 cents. A measure requiring popular ratification as a proposed constitutional amendment was passed to authorize the issuance of \$25,000,000 of highway bonds, with which to meet costs of further road construction. Natural gas distributed within the State—a pipe line having introduced natural gas in large quantity in the preceding year—was subjected to a State tax, at the rates of  $\frac{1}{2}$  cent a thousand feet for 1931,  $\frac{3}{4}$  cent for 1932 and 1 cent thereafter. A proposal to amend the State constitution so as to increase the membership of the State Senate to 67, from 32, was passed, for submission to popular vote in 1932. By the Sanderson acts, passed over Governor Miller's veto, judges of the Circuit Court were empowered to grant probation to criminals receiving sentences up to the term of 10 years, and provision was made for the appointment of probation officers. The dimensions and loads permissible for motor carriers were limited by statute. Aircraft and pilots were placed under State license. Funds paid a bank or trust company for the purpose of transfer by draft or cashier's check were granted the status of preferred claims on such an institution's assets.

**POLITICAL AND OTHER EVENTS.** State Commissioner of Agriculture Storrs addressed to his colleagues of other States early in the year a series of appeals against proposed State and Federal legislation to tax out of business lard and butter substitutes containing cottonseed oil. In conformity with a suggestion made in President Hoover's message vetoing the Federal measure for the disposal of Muscle Shoals, Governor Miller of Alabama named a State commission of 3 members in July to cooperate with a Federal Commission and with a like Commission from Tennessee in seeking plans for disposing of the Federal power plant at the Shoals. Popular vote in Birmingham on March 12 approved an issue of \$1,500,000 of bonds for the cost of the new Jefferson County Court House, to cost in all \$3,000,000, and work on the structure was carried toward completion. The State Supreme Court in an opinion rendered in July declared invalid the action of the Legislature to submit to popular vote an amendment to authorize an income tax.

**ELECTIONS.** The proposed constitutional amendment to permit the issuance of \$25,000,000 of State highway bonds backed by a cent a gallon

of taxation on sales of gasoline was emphatically defeated at the polls on November 3. The reported adverse vote was at the rate of about two to one.

**OFFICERS.** Governor, B. M. Miller; Lieutenant-Governor, Hugh D. Merrill; Secretary of State, Peter B. Jarman, Jr.; Treasurer, Sidney H. Blan; Auditor, John Brandon; State Superintendent of Education, A. F. Harman; Attorney-General, Thomas E. Knight, Jr.

**JUDICIARY.** Supreme Court: Chief Justice, John C. Anderson; Associate Justices, William H. Thomas, A. D. Sayre, A. B. Foster, Lucien D. Gardner, Virgil Bouldin, and Joel B. Brown.

**ALABAMA, UNIVERSITY OF.** A coeducational State institution for higher learning at University, Ala., founded in 1831. For the autumn term of 1931 the enrollment was 4375, distributed as follows: Arts and science, 1859; engineering, 686; law, 192; medicine, 92; graduate, 118; education, 524; commerce, 789; chemistry, 57; and home economics, 58. The summer school registration was 2356. The faculty for 1931-32 numbered 182. The productive funds of the university amounted to \$2,147,599, and the income for the year was \$1,467,000. The library contained about 75,000 volumes, of which 20,000 were government documents. The university's centennial was observed May 10-12, 1931, the address being delivered by Claude G. Bowers, author and editor, of New York City. In January a centennial radio programme was inaugurated, depicting once a week until May, through dramatization or exposition, the history of the University of Alabama. The celebration culminated in the centennial pageant on May 11. President, George H. Denny, Ph.D., LL.D.

**ALASKA.** A territory of the United States, the most extensive of the noncontiguous territories and possessions under the American flag. It forms a peninsula at the northwestern extremity of the North American Continent. Its total area is 586,400 square miles. The capital is Juneau. The population, according to the Fifteenth Census, was 59,278 in 1930; in 1920 it was 55,036.

**GEOLOGY.** Using a Federal appropriation of \$250,000 the U. S. Geological Survey carried out in 1931 what was described as the most significant effort yet made to determine the mineral values of the Territory. A preliminary announcement giving tentative results was made November 8. In the Fairbanks district it was found that the Ryan lode might be judged to contain well over 1,000,000 tons of ore carrying between \$4 and \$5 of gold to the ton, but it remained to be determined whether, as a mining problem, the extraction of the ore could be profitably effected. It was reported that no mine in the district had yet reached a depth of more than 300 feet, so that the question of the continuation of gold-bearing ore in depth remained entirely unsettled. In the Eva Creek district gold ore reserves were estimated at from 25,000 to 50,000 tons bearing more than \$20, in the area of active mining, while the surrounding area had been little prospected.

In the Kantishna district the country rock was described as schist cut by small bodies of intrusive rock; the economic minerals reported were free gold, auriferous pyrite or arsenopyrite, argeniferous galena, sphalerite, tetrahedrite, and stibnite. The character of ore examined

suggested the possibility of its extension to greater depths than had been mined. The completion of an automobile road to this district from the Mount McKinley National Park was an influence likely to promote development.

The Mount Eielson district in Mount McKinley National Park was also made accessible by automobile road. It was described as characterized by a thick series of thin-bedded shales and limestones cut by the granitic mass of Mount Eielson from which many dikes and sills issued. Sphalerite was found to be the most abundant sulphide mineral, followed by galena of considerable silver content. In the Valdez Creek district were reported lenses of quartz in sheared or altered diorite or in slate, the veins ranging up to several feet in width and traceable in some cases for several hundred feet at the surface, yielding samples of substantial gold content.

The Chilitna West Fork district was described as offering quartz veins with gold value, accompanied by altered or sheared rock. Copper and some lead and arsenic were found to be present. The district was not found to contain high grade gold ore in large masses. The Willow Creek quartz veins were found to afford resemblance to California veins that had been mined profitably to great depths. In the Matanuska Valley area a study made of the extent and structure of the anthracite deposit of Anthracite Ridge led to the estimate that some 500,000 tons were present but that structure and topography prevented economic exploitation. Related beds were surmised to lie southward, covered by glacial deposits. Core drilling to determine the presence of surmised underlying beds was intended.

**MINERAL PRODUCTION.** The mineral product of the territory for 1930, \$13,812,000 in value according to revised figures, represented a decrease of some 15 per cent from the total for 1929. The fall was essentially in the value of the copper production, which declined to \$4,244,600 for 1930, from \$7,130,000 for 1929. Silver, produced incidentally to the production of other metals, declined to \$157,300 for 1930, from \$252,000 for 1929; lead and tin production also diminished, in minor totals.

Gold, on the contrary, was produced to a much greater total value, \$8,476,000 for 1930, as against \$7,761,000 for 1929. Thus while the gold production of 1929 had been but 9 per cent greater in value than that of copper, the gold production of 1930 was approximately twice that of copper, in value, and the gold increase offset about one-fourth of the copper decline. Coal mining attained in 1930 a production of the value of \$631,000, as against \$528,000 for 1929. Placer production furnished the greater part of the gold of 1930; it exceeded the placer production of 1929 by nearly \$750,000, and thus totaled \$4,837,000. More than 80 per cent of the placer production came from the operation of dredges, chiefly in the Yukon Valley and the Seward Peninsula.

In 1931, according to preliminary estimates prepared by the Alaskan branch of the U. S. Geological Survey, mines in Alaska produced minerals valued at about \$12,010,000, as against \$13,812,000 in 1930. This would make the total value of the mineral output of Alaska since 1880 approximately \$641,000,000. The source of min-

eral wealth in 1930 and 1931 was approximately as follows (preliminary figures given for 1931):

**VALUE OF MINERAL OUTPUT OF ALASKA IN 1931 AND 1930**

	1931 *	1930
Gold .....	\$ 9,342,000	\$ 8,476,000
Copper .....	1,712,000	4,244,600
Silver .....	89,000	157,300
Coal .....	567,000	631,000
Other minerals (lead, petroleum, marble, tin, platinum, etc.) .....	290,000	303,100
<b>Total .....</b>	<b>\$12,010,000</b>	<b>\$13,812,000</b>

\* Preliminary estimates.

General industrial conditions throughout Alaska in 1931 reflected more or less closely the conditions in the United States generally, though the severity of the depression in Alaska was by no means so acute. The mining industry as a whole was slowed down, and the search for ore deposits and development of mines, other than those whose ore was primarily valuable for gold, was suspended or materially curtailed. Extremely low prices prevailed for all of the mineral commodities except gold. For instance, the average selling price of copper in 1931, according to the U. S. Bureau of Mines, was 8.3 cents a pound as against 13 cents in 1930, a decrease equivalent to more than one-third of the price paid in 1930. Essentially the same condition prevailed for silver and lead, the prices for which, according to the Bureau of Mines, were respectively 29 cents an ounce and 3.8 cents a pound in 1931 against 38½ cents and 5 cents in 1930. In fact, it was estimated that had the amounts of these three metals that were produced in Alaska in 1931 been sold at the prices that were paid in 1930, their combined value would have been over \$1,000,000 greater than the amount stated in these estimates. Not only were the low prices paid for the metals reflected in the value of the minerals produced but also they had a great, though indeterminate, effect on restricting production and discouraging the undertaking of new developments. In the face of this general reduction the large increase in the output of gold from Alaska was extremely timely.

The total production of gold from Alaska mines in 1931 was estimated at \$9,342,000, about \$866,000 more than in 1930, a notable increase not only over the preceding year but also over any of the years since 1919. Together with the value of gold mined in earlier years, it brought the total value of gold produced from the Territory to the sizable figure of almost \$400,000,000. According to preliminary estimates, the production of gold in 1931 was almost evenly distributed between the lode and placer mines, about 49½ per cent having come from the lode mines and about 50½ per cent from the placers. In 1930, less than 43 per cent came from the lodes and more than 57 per cent from the placers. The pronounced change in the ratio for 1931 was brought about by the very large increase in the value of the gold recovered from the lode mines and the slight decrease in that from the placer mines over the value of the gold recovered from these sources in 1930. In the period since gold mining began, the ratio between the value of the gold from the two sources is about 34 per cent from lodes and 66 per cent from placers. Obviously, as the Alaska placers are more easily

and extensively worked, they contributed most largely to the output of the Territory in the early days, but as their extent is limited they will be the first to be exhausted. The lodes, on the other hand, are relatively more expensive to develop, but if they are skillfully managed they are much more likely to afford continuous output and thus equalize or even reverse the ratio that formerly existed between their output and that from the placers. The bulk of the lode gold continued to come from southeastern Alaska, especially from the properties of the Alaska Juneau Gold Mining Co. in the Juneau district. At this place search for new ore bodies, as well as for extension of those already known, was conducted with special activity, and the results appeared to have been distinctly encouraging, so that the work will be continued and will probably be reflected in increased production in the not distant future. The value of the gold recovered from Alaska placers in 1931 was estimated to have been \$4,706,000, or about \$130,000 less than was recovered from mines of this type in 1930. This comparison should not be interpreted as indicating a great falling off of placer mining as a whole, because the output in 1930 was especially large. By far the largest amount of placer gold came from the Yukon region, with the Seward Peninsula region second. The other placer mining regions together contributed less than one-tenth of the entire placer gold output of the Territory. Most of the placer gold is now recovered by dredging, the more primitive hand methods, and the use of the simpler mechanical methods having largely disappeared, except in the more remote districts. About 79 per cent of the placer gold that was recovered in 1931 was produced by dredges, which ratio compares with 1930, when about 81 per cent of the placer gold was recovered by dredges. So far as reported 27 dredges were in operation in 1931, which is the same number as were in operation in 1930. No notable new finds of placer ground were made during the year, but prospecting was in progress at a number of places, some of which are rather remote from the more productive camps.

**COMMERCE.** The trade of the Territory with the continental United States was on a diminished scale of value in the fiscal year 1931, as compared with 1930. Imports into Alaska from the United States totaled \$25,837,703 for 1931; for 1930, \$32,084,734. The exports to the United States fell to \$47,924,863 for 1931, from \$61,522,027 for 1930. The greater part of the decline in exports occurred in the categories of copper and of matte and ore; each of the two groups attained lower totals both by quantity and by value. Their combined shrinkage by value was about 50 per cent, or \$7,604,000. Exports of fish totaled 287,323,593 pounds (1931), as against 292,335,656 pounds (1930). In value, however, they were much reduced, to \$35,510,900 (1931) as against \$44,359,407 (1930). Fur exports rose in quantity to 480,310 pieces (1931), from 409,886 (1930), but declined in value to \$3,193,601 (1931) from \$4,593,132 (1930).

**REINDEER HUSBANDRY.** Secretary of the Interior Wilbur's committee on the reindeer (See NEW INTERNATIONAL YEAR BOOK, 1930: ALASKA) made a report, published in April, recommending the formation of a Reindeer Council of five members to exert administrative control over the industry and, particularly, to formulate range rules. It was found that the

Eskimos were not sufficiently vigilant in marking their herds, while whites were becoming important herd owners, the unmarked adult animals becoming the property of the finder. It was proposed that the council develop the export market for reindeer flesh, setting prices at which the natives might sell, but which they need not accept if they should prefer to keep their animals. Five important reindeer districts were noted, and for each it was recommended that the proposed council appoint a superintendent, paid by the Government, as the direct administrative official. The chief of these districts was on the Seward Peninsula, bordering on the Bering Sea and running almost to the mouth of the Yukon River; here the largest and most accessible herds were reported to have developed. An early roundup of the beasts in this area was recommended with a view to the marking of all mavericks and the termination of disputes. The prospect of an eventually important trade with the continental United States in reindeer flesh was emphasized by the Department of the Interior. Reindeer were introduced into Alaska about 1890 as a relief measure to provide food and clothing for the native people. The original herds contained less than 1,500 deer. From this small herd the entire western part of Alaska has been supplied and it was estimated that there were several hundred thousand animals in the herds that were distributed from Point Barrow to Atka Island and in the Yukon Valley. There were a few places where the natives were not supplied with deer, but the Government owned between 10,000 and 12,000 animals and these were to be used to supply new herds as rapidly as possible.

**FISHERIES.** The total value of the output of the Alaska fisheries in 1930, exclusive of aquatic furs, was \$37,679,049, as compared with \$50,795,819 for the previous year. On the basis of the number of salmon caught there was an increase of 15 per cent over the take in 1929. The Yukon River was closed to commercial fishing for several years and reports in 1931 indicated that the runs were again normal. The closing of the river deprived the natives and other residents of the lower Yukon of one source of income and they were sorely in need of assistance. Limited commercial fishing by bona fide residents was held advisable if investigations by the Bureau of Fisheries disclosed that such action could be taken without jeopardizing the future supply or depriving the residents along the upper reaches of the river of their food.

The whaling industry maintained an average production, but the value of the output was approximately 7 per cent less than in 1929. Two whaling stations were operated and a fleet of seven steam vessels were used in the capture of 355 whales; 206 persons were employed in the manufacture of 810,700 gallons of whale oil valued at \$371,276; 121,150 gallons of sperm oil valued at \$45,431; 1170 tons of fertilizer valued at \$51,400; 37,000 pounds pickled meat valued at \$1850; and 5600 pounds of whale bone valued at \$308. The total value of these products was \$470,265 as compared with \$502,081 in 1929.

**SEALSKINS.** When the control of the Alaskan seal herd passed to the United States Government the herd numbered approximately 132,000 animals and in 1930, 20 years later, there were 1,045,101 seals of all classes on the islands. The

rehabilitation of the seal herds was an outstanding achievement and demonstrated the results that might be derived under proper methods of control and utilization of the surplus. In 1930, 42,500 skins were taken from the rookeries on St. Paul and St. George Islands. This was the largest take since the Government assumed control. During the year 41,516 skins were sold at public auction for a gross price of \$821,767.

**PUBLIC HEALTH.** A large staff of nurses and doctors are employed in the work of safeguarding the health of the native people. Funds were available for the necessary personnel, and the early appointment of a qualified officer as medical director was urged by the governor in his Annual Report. There were sections of the Territory, larger than some of the smaller States, which were without hospitals or medical service of any kind. Practically all of the population in these sections were native people. A 5-year programme, which would provide adequate hospital facilities in every section should be prepared and approved. Also the hospital boat on the Yukon River should be replaced with a new vessel completely equipped for the service.

**EDUCATION.** The duty of administering education and medical and sanitary relief among Eskimos, Aleuts, and Indians in the Territory was transferred on March 16 from the Office of Education to the Bureau of Indian Affairs. For the fiscal year opening on July 1, 1931, the Federal Congress made for these purposes appropriations totaling about \$1,200,000 whereof some \$800,000 was for native schools, \$320,000 for health and \$100,000 for completing an industrial boarding school for natives at Shoemaker Bay. A survey of the native communities in the Territory by the Office of Indian Affairs disclosed that there were 25 villages with a school population of more than 25 children where there were no school facilities. There were a far greater number of small communities which had a school population of 10 or more children who were denied the privilege of attending school. The construction of not less than 10 schools each year until every community was equipped with adequate facilities was recommended by the Governor in his Annual Report. See AGRICULTURAL EXPERIMENT STATIONS.

**ALBANIA**, al-bā'nī-ā. A Balkan kingdom on the east coast of the Adriatic, situated between Yugoslavia on the north and Greece on the south. Capital, Tirana, with 30,800 inhabitants in 1930; reigning King in 1931, Zog I, proclaimed by the National Assembly Sept. 1, 1928.

The area is approximately 10,629 square miles and the population (census of 1927), 833,618, of whom 563,729 were Mohammedan, 181,051 Greek Catholic, and 88,739 Roman Catholic. A 1930 census showed 1,005,902 inhabitants. The Ghegs in the north and the Tosks in the south are the principal race groups. The other towns are Coriza (population 22,787 in 1930) and Scutari (29,209). Durazzo (8739) and Valona (9100) are the leading ports. Primary education is nominally compulsory, but the law is not enforced. State primary schools in 1929 numbered 495, with 28,199 pupils (5232 girls). There were also 32 state secondary schools, with 1247 pupils, and about 900 young Albanians studying abroad.

**PRODUCTION AND COMMERCE.** Primitive agriculture and cattle-raising are the principal occupations of the Albanian people. Only about

926 square miles were under cultivation in 1930; although the country is mountainous and wooded there are additional large areas available for cultivation. The state owns about 125,000 acres of land and under King Zog has taken an active interest in modernizing agriculture. The leading products are tobacco, timber, hides, wool, furs, dairy products, cheese, fish, olive oil, and corn. There are extensive forests of valuable timber and mineral resources are said to be of importance, but neither are developed to any appreciable extent. Flour-milling, cheese-making, olive-pressing and similar agricultural industries are carried on. Imports in 1929 were valued at 38,638,000 gold francs and exports at 14,982,804 gold francs (the Albanian gold franc has a par value of \$0.1929). Imports showed a steady increase from 21,799,411 francs in 1925, while exports declined from 17,122,761 francs in 1925.

**FINANCE.** In the budget for the fiscal year ended Mar. 31, 1931, as adopted by Parliament, revenues were estimated at about \$5,800,000 and expenditures at about \$6,300,000. The estimates submitted to Parliament balanced at 31,385,000 gold francs (about \$6,057,000 at par), compared with 31,827,200 francs in 1929-30. In accordance with a law passed by the Albanian Parliament in June, authorizing the Government to contract a foreign loan for bridge construction and the conversion of the debt, Italy agreed to lend its ally the sum of 10,000,000 gold francs annually for ten years. It was officially stated that the loan would be free of interest and "repayable when the condition of the Albanian budget shall permit of it." A loan of 50,000,000 gold francs was floated in Italy in 1925; it is guaranteed by Albanian Customs receipts and the income from Government monopolies.

**COMMUNICATIONS, ETC.** A railway line 22 miles long between Durazzo and Tirana was under construction in 1931. A motor-road network 1061 miles in length links the principal cities. Five airlines radiate from Tirana to Scutari, Coriza, Valona-Argirocastro, Pescopeia, and Cuesi, all controlled by Italian capital. Under the Constitution of 1928, the King administers the government, assisted by a council of ministers appointed by him and a parliament of one chamber, the members of which are elected indirectly for four years. A ministerial crisis in the spring of 1931 resulted in the reorganization of the Cabinet under former Premier Pandeli Evangheli.

**HISTORY.** The Treaty of Tirana, signed in 1926, under which Italy agreed to oppose any disturbance of the *status quo* in Albania, provided King Zog requested aid, expired in November, 1931, and was not renewed. This was considered an indication that King Zog considered himself sufficiently secure against a revolution to dispense with Italian aid. The Italian-Albanian defensive alliance of 1927 continued in force. King Zog in 1931 was declared by observers to be pursuing a policy largely independent of Italian control, while accepting Italian aid in the modernization of his country. The King, however, was forced into closer relationship with the Italian Government by an attempt to assassinate him made in Vienna February 20, during which his adjutant was killed. The two assassins were arrested by the Vienna police and tried in the Upper Austrian town of Ried in September. They were identified

as Ndok Gheloshi, leader of the revolt against King Zog in 1925, and Aziz Cami, a Moham-medan army captain and adherent of the former Democratic party leader, Fan Noli. Both were Albanian citizens in exile from their country and under sentence of death there. The defend-ents admitted that their attempt on King Zog's life was a political crime, but alleged extenuat-ing circumstances. A jury on October 3 sen-tenced Gheloshi to seven years' and Cami to three years' imprisonment. King Zog was re-ported to have been convinced that the crime was inspired by the Yugoslav Government.

For Albania's part in the Balkan Conference, see *TURKEY* under *History*. See also *YUGOSLAVIA* and *ITALY* under *History*.

**ALBERTA**, al-bŭr'tă. The westernmost of Canada's Prairie Provinces, bounded by Sas-katchewan on the east, British Columbia on the west, and the United States on the south. Area, 255,285 square miles; population at the census of 1931, 727,497, as compared with 607,584 in 1926. The chief towns, with their census popula-tions in 1931 and 1921 (in parentheses), are: Calgary, 83,362 (63,305); Edmonton (the capi-tal), 78,829 (58,821); Lethbridge, 13,448 (11,097); Medicine Hat, 10,310 (9634). In 1929, there were 16,748 births, 6234 deaths, and 5999 marriages. Enrollment in the 3640 public schools (1929) was 164,850; in three normal schools, 801; in the University of Alberta, 1516.

Agriculture is the chief occupation, but the extraction of coal, natural gas, and petroleum are important supplementary industries. Only about one-sixth of the land available for agri-cultural development is under cultivation. The acreage sown to the chief crops in the spring of 1931 was 11,793,031, compared with 8,312,512 in the spring of 1921. The estimated gross agricultural revenue of the province in 1929 was \$223,240,000, of which \$157,254,000 repre-sented field crops. In 1930, the value of field crops shrank to \$95,828,400, due largely to the fall in the price of wheat. Production of the chief crops in bushels (1930) was: Wheat, 132,900,000; oats, 77,940,000; barley, 18,999,000; rye, 3,714,000. The potato crop totaled 2,536,000 cwt.; hay and clover, 517,000 tons. Alberta ranked fourth among the Provinces in mineral production in 1930, with an output valued at \$30,629,997 (\$34,739,986 in 1929). Coal produc-tion (1929) was valued at \$22,928,182; natural gas, \$4,684,247; petroleum, \$3,458,177. The lum-ber industry in 1930 engaged nearly 4000 men and produced 97,351,298 feet of lumber (167,657,787 feet in 1929).

Executive power rests nominally with a lieutenant-governor appointed by the Dominion Government, but actually with the Executive Council of the Provincial Legislature. Of 63 mem-bers in the Legislature (1930), 39 were United Farmers of Alberta, 11 Liberals, 6 Conservatives, 4 Labor members, and 3 Independents. The Province sends 6 members to the Senate and 16 to the House of Commons at Ottawa. For the fiscal year ended Mar. 31, 1930, ordinary rev-enues and expenditures totaled \$15,829,865 and \$15,402,884, respectively. There was a deficit of \$2,306,581 for 1930-31. The gross bonded debt on Mar. 31, 1930, stood at \$106,888,380, of which \$38,936,134 represented self-supporting assets. As a result of the favorable settlement of the school lands case in July, 1931, Alberta obtained a judgment for \$9,564,569 against the Dominion.

There were in 1929 5568 miles of railway line within the Province and a state-owned telephone system, with 209,939 miles of wire. Air lines connect the principal cities. Lieut.-Governor in 1931, Dr. W. Egbert; Premier and Provincial Secretary, John E. Brownlee. See *CANADA*.

**ALDEHOL**. See *CHEMISTRY*, *INDUSTRIAL*.

**ALDERMAN**, EDWIN ANDERSON. An Ameri-can educator, president of the University of Vir-ginia, died in Connellsville, Pa., Apr. 29, 1931. He was born in Wilmington, N. C., May 15, 1861, and was graduated from the University of North Carolina in 1882, later receiving the D.C.L. degree from the University of the South and the LL.D. degree from Tulane, Johns Hop-kins, Columbia, Yale, North Carolina, and Harvard Universities and from Williams and Dartmouth Colleges. He was professor of Eng-lish at the North Carolina State Normal College in 1892; professor of education at the University of North Carolina during 1893-96, and presi-dent of that institution during 1896-1900; and president of the Tulane University of Louisiana during 1900-04. Recognized for his efforts to advance education in the South and as one of its most influential, moral, and spiritual lead-ers, he was elected president of the University of Virginia in 1904.

In addition to serving as former district di-rector of the Southern Education Board, he was a member of the General Education Board and of the boards of the Woodrow Wilson Founda-tion, the Thomas Jefferson Memorial Founda-tion, the Institute of Economics, the Institute of Politics, and the Institute of Public Affairs. He was also a member of the American Academy of Arts and Letters. By invitation he was select-ed to deliver before the Congress of the United States on Dec. 15, 1924, the memorial address for President Woodrow Wilson. Among his works are *Sectionalism and Nationality* (1906); *The Growing South* (1908); *Virginia* (1909); *The National Spirit* (1911); *J. L. M. Curry: A Biography* (1911); *Function and Needs of Schools of Education in Universities and Col-leges* (1917); and *Woodrow Wilson: A Memorial Address Delivered before the Joint Houses of Congress* (1925). He was editor of *Classics Old and New* (1906) and editor-in-chief of the *Library of Southern Literature* (1909-23).

**ALFALFA**. The alfalfa hay crop of the United States was estimated by the Department of Agri-culture at 20,914,000 tons compared with 22,871,000 tons in 1930 and 23,854,000 tons in 1929. The crop of 1931 was the smallest since the es-tablishment of production records in 1919 and was approximately only two-thirds of the crop of 1927, the highest production ever recorded. The yields in 1931 were especially low in the Great Plains and Western States and they were not sufficiently high in the States east of the Mississippi to offset these reductions. The yields of the leading States in tons were as follows: California, 2,699,000; Idaho, 1,802,000; Nebraska, 1,606,000; Minnesota, 1,163,000; Colorado, 1,152,000; Kansas, 1,114,000; and Iowa, 1,061,000. These States produced over half the tonnage of the entire country. Production was reported from all States except Florida.

The area devoted to the crop in the United States in 1931 was 11,602,000 acres which was

65,000 and 105,000 acres respectively above the areas in 1930 and 1929. Owing to the difference in the yield per acre in various sections production and acreage varied to a marked extent. Nebraska, ranking third in production, stood first in area with 1,147,000 acres, while California, first in production and yielding over a million tons more, stood second with only 818,000 acres. The States ranking next in alfalfa area were Idaho with 751,000 acres; Colorado with 743,000 acres; Minnesota with 727,000 acres; Kansas with 719,000 acres and Montana with 660,000 acres. The average yield per acre was 3.3 tons in California, 2.4 tons in Idaho and 1.4 tons in Nebraska.

The production of alfalfa seed in 1931 of 18 States reporting was estimated at 852,600 bushels, about 25 per cent and 13 per cent less than the production of 1930 and 1929 respectively. The acreage harvested for seed, 353,000 acres, was about 16 per cent less than in 1930 and about 12 per cent less than in 1929. The leading States and their yields were as follows: Kansas, 144,500 bushels; Idaho, 94,500 bushels; Nebraska, 72,800 bushels; California, 70,700 bushels; Colorado, 60,000 bushels, and Utah, 57,000 bushels. In area devoted to the seed crop the leading States ranked as follows: Kansas, 57,800 acres; Montana, 33,000 acres; Utah, 32,000 acres; Nebraska, 28,000 acres; South Dakota, 25,600 acres; Idaho, 21,000 acres; Colorado, 20,000 acres, and California, 19,100 acres. The highest average yields per acre, 4.5, 3.17, 3, 2.6, and 2.5 bushels were secured in Idaho, California, Colorado, Nebraska, and Kansas respectively. In most of the more important producing States the yield per acre in 1931 was below that of the preceding year. The imports of alfalfa seed for the fiscal year ended June 30, 1931, were 233,400 pounds as compared with 337,000 pounds the year before. The imports for 1931 comprised 177,900 pounds from Canada, 44,500 pounds from Argentina and 11,000 pounds from France. The exports for the year were estimated at 350,000 pounds.

**ALGERIA.** A colony of France in northern Africa, comprising the two great divisions of Northern Algeria and Southern Algeria. Northern Algeria has an area of 80,117 square miles and a population (census of 1926) of 5,521,271; Southern Algeria, an area of 767,435 square miles and a population of 542,225. The total population in 1929 was estimated at 6,255,000 (6,066,380 in 1926). Of the total area of 847,552 square miles, all but about 222,206 square miles are desert. The European population was 833,359, including 549,146 French, 108,495 naturalized French, 135,032 Spaniards, and 28,594 Italians. The native population is almost entirely Moslem. The chief towns, with their populations in 1926, were Algiers, the capital, 226,218; Oran, 150,301; Constantine, 93,733; and Bône, 51,895. For the five-year period 1924 through 1928, births averaged 163,900 and deaths 108,917 annually. In 1929, there were 128,661 pupils in elementary and secondary schools, and in 1930, there were 1870 students in universities.

**PRODUCTION.** Algeria is primarily dependent upon agriculture, which is restricted to the coastal valleys and plains. In 1929, there were 15,298,000 acres of arable land, 658,000 acres of permanent meadow, 68,096,000 acres of grazing land, and 10,700,000 acres of forests. Pro-

duction of the chief crops in 1930, a poor year due to prolonged drought, was: Wheat, 30,644,000 bushels; barley, 37,663,000 bushels; oats, 13,503,000 bushels; potatoes, 1,837,000 bushels; wine, 351,347,000 gallons; olive oil, 3,332,000 gallons; tobacco, 38,509,000 pounds; and cotton, 2,534,000 pounds. Dates, fruits, vegetables, silk, and flax are other products. Livestock in 1930 included 939,000 cattle, 7,168,000 sheep, 3,268,000 goats, 173,000 horses, 471,000 mules and asses, and 201,000 camels. Wool production (1930) was estimated at 49,600,000 pounds (47,230,000 pounds in 1929). About one-half of the sheep in the country were reported to have died as a result of drought prior to Jan. 1, 1931.

**Mineral production** in 1930 in metric tons was as follows: Iron ore, 2,234,000; iron pyrites, 16,228; zinc ore, 22,163; lead ore, 13,945; coal, 17,173; petroleum, 1654; and phosphates, 864,000. Copper is also mined. The fishing industry is important.

**COMMERCE.** Exports in 1930 were valued at \$178,446,000 (\$151,998,000 in 1929) and imports at \$228,524,000 (\$229,647,000 in 1929). While imports changed but little, the value of exports increased 17 per cent. About 79 per cent of the total 1930 imports came from France and about 77 per cent of all exports were destined for that country. Exports to the United States in 1930 were valued at \$2,399,000, or about 40 per cent less than in 1929. Algeria exports agricultural and mineral products in return for manufactured articles.

**FINANCE.** The budget for the calendar year 1931 placed ordinary receipts at 1,137,490,000 francs (1 franc equals \$0.0392 at par) and extraordinary receipts at 1,108,017,000 francs, the total estimated receipts being equivalent to \$88,024,000. For the same year, ordinary expenditures were estimated at 1,136,970,000 francs and extraordinary expenditures at 1,108,017,000 francs, or the equivalent of \$88,003,000. For 1930, total receipts were estimated at the equivalent of \$73,446,000 and total expenditures at \$85,025,000. The public debt at the end of 1929 stood at 926,000,000 francs, or approximately \$36,299,000.

**COMMUNICATIONS.** Railway lines in 1928 extended 2981 miles, of which about 2000 miles belonged to the government. Gross receipts for the year totaled 375,000,000 francs (about \$14,700,000). In 1931, the government undertook the electrification of the line from Bône to Oued Keberet. Highways extended about 21,753 miles in 1930, of which 8860 miles were macadam. The telegraph and telephone systems are also government owned. The net registered tonnage of vessels entering the ports in 1930 was 8,306,000 (8,314,000 tons in 1929) and the tonnage clearing was 8,393,000 (8,466,000 tons in 1929).

**GOVERNMENT.** The central executive authority of the local government is the Governor-General who directs all the services with the exception of the non-Musulman departments of public instruction, justice, worship, and the treasury, which are each under a separate ministry. The Governor-General, with the Minister of the Interior, prepares the budget which is voted by the so-called financial delegations and by the Superior Council. The colony sends to the French Parliament one Senator and two Deputies from each of the three departments. The Parliament at

Paris has the sole right to legislate for Algeria. Governor-General in 1931, M. Jules Carde, appointed Oct. 3, 1930.

**ALL-AMERICAN CANAL.** See CANALS.

**ALLEGHENY COLLEGE.** A coeducational institution of higher learning in Meadville, Pa., nonsectarian in policy but under the patronage of the Methodist Episcopal Church; founded in 1815. The enrollment for the autumn of 1931 was 588, and for the summer session 125. The faculty numbered 44 members. The productive funds of the college amounted to \$1,400,000, and the income for the year 1930-31 was \$417,444. The Reis Library contained 80,000 volumes. This library was also doubled in size by a \$100,000 addition, making its capacity 225,000 volumes. President, William P. Tolley, Ph.D., D.D.

**ALLEN, FRANCIS RICHMOND.** An American architect, died Nov. 7, 1931, in Boston, Mass., where he was born Nov. 22, 1843. He was graduated from Amherst College in 1865, later attending the Massachusetts Institute of Technology (1876-77) and the École des Beaux Arts, Paris (1877-78). He began his practice in Boston in 1879, and from 1904 to 1926 was a member of the firm of Allen and Collens. His collegiate and ecclesiastical work was especially noted for its adaptation of the Gothic. Outstanding among these buildings are those at Williams College, Vassar College, Union Theological Seminary, New York City, and Andover Theological Seminary. He also designed Emmanuel Church, Boston; Memorial Hospital, Canandaigua, N. Y.; and the Woman's Hospital and residence of Arthur Curtiss James, New York City. He was elected a Fellow of the American Institute of Architects in 1935 and was vice president of the permanent committee of the International Congress of Architects.

**ALLIANCE FRANÇAISE, FÉDÉRATION DE L'.** An association of clubs and groups formed for the purpose of encouraging and furthering the study and cultivation of the French language, literature, art, and history in the United States and Canada. It was established in 1902 and in 1931 comprised more than 250 local branches, including French alliances, affiliated societies, and French clubs in universities, colleges, and schools. Ten new groups were added to the Fédération during 1931. Each year the Alliance Française brings from France one or more lecturers who are prepared to speak before all the affiliated societies and clubs wishing to hear them. It also organizes lecture tours for distinguished French travelers, and for French lecturers who live in America, assists in organizing courses in the French language and literature in cooperation with the leading universities, and encourages its groups to engage in dramatic performances and debates in French.

The official lecturers for the season 1930-1931 were Charles Mauricheau-Beaupré and Gaston Gille. M. Mauricheau-Beaupré was assistant curator of the National Museums at Versailles and professor at the École du Louvre. Among his publications the best known are: *Le Château de Versailles et ses jardins*, *Trianon*, *La Cour de Louis XIV et la Cour au XVIIIème Siècle*. M. Gille was professor of French at the College of the City of New York and an authority on political and social questions. The Fédération's Assemblée Générale, attended by representatives of the various groups, was held at the Hotel Plaza, New York City, Apr. 11, 1931. The official

periodicals of the organization are *L'Echo de la Fédération* and *Bulletin Officiel*. The officers in 1931 were: President, Frank D. Pavey; general vice president, William Nelson Cromwell; president of the executive committee, Albert Blum; treasurer, James N. B. Hill; and general secretary, Abigail B. Hagarty. Headquarters are at 32 Nassau Street, New York City.

**ALLINSON, FRANCIS GREENLEAF.** An American philologist, died in Hancock Point, Me., June 23, 1931. He was born in Burlington, N. J., Dec. 16, 1856, and was graduated from Haverford College in 1876, receiving the Ph.D. degree from Johns Hopkins University in 1880. From 1880 to 1882 he was an assistant professor of Greek and Latin at Haverford College, and from 1882 to 1891 head master of classics at the University School in Baltimore. He was appointed assistant professor of Greek and Latin at Williams College in 1892, and three years later was called to Brown University as associate professor of Greek and classical philology. He became professor of classical philology at Brown in 1898 and professor of Greek literature and history in 1915, retiring as professor emeritus in 1928. During 1910-11 he was Brown University annual professor at the American School of Classical Studies in Athens, and was appointed a member of the managing committee in 1913. He was also president of the American Philological Association during 1921-22. His published writings include: *Greek Prose Composition* (1895); *Greek Lands and Letters* (with his wife, Anne C. E. Allinson, 1909); and *Lucian-Satirist and Artist* (1926). He edited texts of several Greek authors, and was a contributor to *Studies in Honor of Basil L. Gildersleeve* (1902) and to the *American Journal of Philology*.

**ALLODELPHITE.** See MINERALOGY.

**ALLOYS.** See CHEMISTRY, INDUSTRIAL.

**ALSACE-LORRAINE, Al'zàs'lór'ân.** The provinces taken from France by Germany after the Franco-Prussian War of 1870-71 and restored to France after the Armistice of Nov. 11, 1918; constituting at present the three French departments of Bas-Rhin, Haut-Rhin, and Moselle. Total area, 5605 square miles; total population in 1926, 1,795,100. The area and population are distributed among the three departments as follows: Bas-Rhin (formerly Lower Alsace), 1848 square miles and 670,985 inhabitants; Haut-Rhin (formerly Upper Alsace), 1354 square miles and 490,654 inhabitants; Moselle (formerly Lorraine), 2403 square miles and 633,461 inhabitants. Alsace-Lorraine contains the only petroleum fields of commercial importance in France, as well as extensive iron-ore and potash deposits. For developments in the autonomist movement in Alsace during 1931, see FRANCE under *Local Elections*.

**ALUMINUM.** New aluminum produced in the United States during 1930 amounted to 229,035,000 pounds, valued at \$50,961,000, as compared with 225,000,000 pounds, valued at \$51,864,000, produced in 1929. The principal producing plant was that at Massena, N. Y., where approximately 44 per cent of the metal made in the United States was produced. Other works are at Niagara Falls, N. Y.; Alcoa, Tenn.; and Badin, N. C. According to the *Engineering and Mining Journal*, the domestic price of new aluminum ingot 99 per cent pure was 24.3 cents a pound until June 26, 1930, when a new quota-

tion of 23.3 cents a pound was announced, which price prevailed until the close of the year. A corresponding reduction—from 23.9 cents to 22.9 cents a pound—was made in the price in the outside market for metal 98–99 per cent pure.

Certain of the established uses for aluminum showed decreases in 1930 in demand for the metal, but these were more than offset by gains in other uses, particularly in strong aluminum alloy materials, in electrical conductors, and in paint. New uses were developed and improvements made in older applications largely as a result of industrial research. Lessened consumption of aluminum in 1930 was especially to be noted in the automobile and aircraft branches of the transportation industry.

Builders of truck and bus bodies incorporated aluminum strength-members in body frames, in addition to low-stressed parts, such as paneling and roofing. Tank trucks for gasoline haulage and trucks for heavy commodities, such as coal and sand, to light merchandise utilize aluminum in the form of strong alloy sheets and structural shapes, heat treated to develop maximum physical properties. There was introduced in 1930 a new piston alloy, of low expansion coefficient, further insuring the market for aluminum pistons, and it was stated that over 75 per cent of the automobile passenger car manufacturers in the United States were using aluminum alloy pistons. Large structural shapes of strong aluminum alloys, available in sizes up to 85 feet in length and 14 inches in depth, were produced for use in railroad and railway car construction, for trucks and busses, and such units as cranes and hoists.

Strong aluminum alloy wire was introduced as a new material for woven fence and barbed wire, while aluminum window screening was also being made. In both instances durability is the prime advantage of aluminum. The resistance of aluminum to atmospheric corrosion is also responsible for a steady increase in the use of the metal as a roofing and sheet metal material, and for an even sharper increase in its use as an ornamental metal on the exteriors of office and public buildings. Notable quantities of aluminum were being used for building purposes, and in the Empire State Building in New York, approximately 850,000 pounds of aluminum was used.

The consumption of the metal in aluminum cable and busbar accounts each year for an average of about 16 per cent of the production of aluminum in the United States. Bare stranded cable with a core of steel was employed for transmission lines, while insulated aluminum wires and cables similar to those of copper were in use in the form of insulated cables for underground network systems, automobile starter cable, aviation, and automobile wiring systems, and other wire and cable products. Electroplating on aluminum, and chemical or electro-

chemical processes of coloring aluminum had been placed on a commercial basis while heavy aluminum foil or thin sheets of aluminum were found to offer a protective coating for oil tank cars, pipe-lines, storage tanks, and similar structures.

The approximate consumption of virgin domestic aluminum by industries is indicated in the table in the preceding column.

**AMERICAN ASSOCIATIONS AND SOCIETIES.** For various scientific and other organizations whose official titles begin with the word American, see under the important descriptive word of the title.

**AMERICAN CHEMICAL SOCIETY.** See CHEMISTRY, INDUSTRIAL.

**AMERICAN FEDERATION OF LABOR.** See LABOR, AMERICAN FEDERATION OF; UNEMPLOYMENT.

**AMERICAN LEGION.** An organization of World War veterans, chartered by Congress in 1919. Its purpose is "to uphold and defend the Constitution of the United States; to maintain law and order; to foster and perpetuate a 100 per cent Americanism; to preserve the memories and incidents of our association in the Great War; to inculcate a sense of individual obligation to the community, State and nation; to combat the autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom, and democracy; to consecrate and sanctify our comradeship by our devotion to mutual helpfulness."

The legion's thirteenth national convention was held in Detroit, Mich., Sept. 21–24, 1931. There was an accredited delegate attendance of 1415 representing every State, the District of Columbia, nine departments outside the continental limits of the United States, and two foreign posts. Upwards of 100,000 persons marched in the annual parade which required eight hours to pass the reviewing stand. President Hoover attended and addressed the convention. The distinguished guests and speakers included: Newton D. Baker, wartime Secretary of War; Gen. Charles B. Sumnerall; Theodore Roosevelt, governor of Porto Rico; Frank T. Hines,\* administrator of Veterans' Affairs; George L. Berry, representing the American Federation of Labor; Floyd Gibbons, war correspondent for the *Chicago Tribune*; Edward L. White, president of Fidac; Wilber M. Brucker, governor of Michigan; Frank Murphy, mayor of Detroit; Judge Kene-saw Mountain Landis; Harry Woodring, governor of Kansas; Arthur H. Vandenberg and James Couzens, U. S. Senators from Michigan; Richard B. Russell, governor of Georgia; Maj. Gen. George B. Duncan; Mrs. Edith Nourse Rogers, representative in Congress for the fifth Massachusetts district; Hon. W. D. Herridge, Canadian Minister to the United States; Capt. Louis de Vaisseau Sable, representative of France; Baron Gaston de Bethune, representative of Belgium; Gen. Gustaw Orlicz-Dreszer, representative of Poland; and Admiral Baron Alfredo Acton, representative of Italy.

The principal accomplishments during the year were set forth in the report of Ralph T. O'Neil, the retiring national commander. Cash recoveries for veterans, effected through the work of the national rehabilitation committee of the legion, amounted to \$6,456,387. These recoveries

#### CONSUMPTION OF ALUMINUM BY INDUSTRIES

	Per cent
Transportation (land, air, and water) .....	38
Electrical conductor .....	16
Cooking utensil .....	14
Machinery (electrical appliances, etc.) .....	9

General miscellaneous .....	4

were in the form of disability compensation, insurance, disability allowance, adjusted compensation, and other types of claims handled for veterans and their dependents. The legion successfully sponsored the appropriation by Congress of approximately \$21,000,000 for the construction of veterans' hospitals. Another important legislative accomplishment was the enactment of a law permitting veterans to borrow up to 50 per cent of the face value of their adjusted compensation certificates. See UNITED STATES under Congress. Because of the economic depression, unemployment, and distress brought about by drought, the legion carried on much relief work throughout the United States.

The national child welfare programme was advanced during the year, with the legion taking an active part in obtaining improved child welfare legislation in the various States and extending direct aid to many children of veterans. In response to an appeal from national headquarters, legion posts throughout the United States threw their support behind efforts to find jobs for the unemployed. Reports received indicated that about 200,000 were placed in employment. Progress was made in the legion's three-fold Americanism programme which emphasized education, youth activities, and community service. Upwards of 400,000 boys were enrolled in the junior baseball programme, conducted as one of the youth activities. Many other activities were successfully sponsored.

The official publication of the national organization is the *American Legion Monthly*. The membership of the legion on Dec. 1, 1931, was 1,053,408. The American Legion Auxiliary, composed of mothers, wives, daughters, and sisters of Legion members, had a membership of 411,248 on the same date. Legion officers elected for the year 1931-1932 were: Henry L. Stevens, Jr., Warsaw, N. C., national commander; Richard F. Paul, Boston, Mass., Harold L. Plummer, Madison, Wis., Forrest G. Cooper, Indianola, Miss., Roy L. Cook, Albuquerque, N. M., and Frank N. Brooks, Bellingham, Wash., national vice commanders; and the Rev. H. A. Darche, Bradley, Ill., national chaplain. The following national officers were continued in office by action of the national executive committee: James F. Barton, Fort Dodge, Ia., national adjutant; Bowman Elder, Indianapolis, Ind., national treasurer; and Eben Putnam, Wellesley Farms, Mass., national historian. The committee appointed Remaster Bingham, Indianapolis, Ind., national judge advocate. National headquarters are in the World War Memorial Building, 777 North Meridian St., Indianapolis, Ind. See PROHIBITION.

**AMERICAN REVOLUTION, ANNIVERSARY CELEBRATION.** See CELEBRATIONS.

**AMHERST COLLEGE.** An institution for the higher education of men in Amherst, Mass., founded in 1821. For the autumn term of 1931 approximately 651 students were enrolled. The active faculty, exclusive of administrative officers, emeritus professors, and those on leave, numbered 73. The productive assets of the college amounted to \$8,615,346, and the income for the year was \$844,217. The library contained 175,000 volumes. President, Arthur Stanley Pease, Ph.D.

**AMMONIA.** See FERTILIZERS.

**AMPHIBIA.** See ZOÖLOGY.

**AMSTERDAM INTERNATIONAL.** See TRADE UNIONS; SOCIALISM.

**ANEMIA.** See FOOD AND NUTRITION under *Trace Elements*; MEDICINE, PROGRESS OF.

**ANESTHESIA.** See CHEMISTRY, INDUSTRIAL.

**ANALYSIS, CHEMICAL.** See CHEMISTRY.

**ANALYTICAL CHEMISTRY.** See CHEMISTRY.

**ANAPLASMOSIS.** See VETERINARY MEDICINE.

**ANATOLIA,** an'-tō'lī-ā. An ancient geographical name for the land east of the Aegean Sea, now loosely applied to the western part of Asia Minor. See TURKEY.

**ANDORRA,** an-dōr'ra. A tiny state in the Pyrenees, under the joint suzerainty of the French President and the Spanish Bishop of Urgel. Area, 191 square miles; population, 5231 in 1924; capital, Andorra-la-Vieja (population, 700). The Andorrans, who speak Catalan, are governed by an elected council of 24 members, acting through a First Syndic. The two civil judges are appointed by France and the Bishop of Urgel, respectively. There is a customs union with France and a postal union with Spain. Andorra's accustomed peace was disturbed in 1931 when 400 Spanish laborers engaged in building a road through the country from Spain to France made threats which the Andorrans interpreted as a declaration of war. Andorra has no army but the peasants mobilized with scythes and other makeshift arms and drove the Spaniards across the border. Construction of the highway, which was to have ended Andorra's centuries of isolation, was indefinitely postponed.

**ANGINA PECTORIS.** See SURGERY, PROGRESS OF.

**ANGLO-EGYPTIAN SUDAN.** A British-controlled territory in the upper Nile region of Africa, extending south from Egypt and Libya to British East Africa and the Belgian Congo; bounded on the east by the Red Sea, Eritrea, and Ethiopia, and on the west by French Equatorial Africa. Area, estimated at 1,008,100 square miles; population in 1929 estimated at 5,579,776. Capital, Khartoum, with 42,240 inhabitants; other cities, Omdurman, 102,983; Khartoum North, with adjacent rural district, 102,512.

In 1930, there were 87 elementary vernacular schools, with 8348 pupils; 10 primary schools, with 1276 boy pupils; 22 girls schools, attended by 1919 pupils; and 768 native schools aided by the Government, with 26,880 pupils. The Sudan furnishes most of the world's gum arabic. Cotton, senna, dates, ground-nuts, salt, ivory, hides and skins, and gold are other leading products. In 1929-30, 27,480 tons of cotton lint and 61,000 tons of cotton seed were harvested from 355,594 acres. Livestock in 1929 included about 1,505,000 cattle, 2,200,000 sheep, 400,000 camels, 22,000 horses, and 350,000 asses. Valuable forests border the Nile and its branches. Imports in 1929, including Government stores, were valued at £6,856,114 and exports, excluding reexports, at £6,526,112. The Egyptian pound exchanged at \$4.98 in 1929.

Budget estimates for 1930 balanced at £4,929,000, including net receipts from railway and steamboat lines, compared with actual revenues, of £6,981,500 and actual expenditures of £6,610,274 in 1929. In addition, the revenue and expenditure of local provincial services in 1929 totaled £126,729 and £108,719, respectively. Railway lines open for traffic in 1930 totaled 1990 miles and linked the chief interior points with the Red Sea at Port Sudan and Suakin.

There were about 225 miles of main highways besides roads passable to motor cars in dry weather. A fleet of Government steamers sails the navigable arms of the Nile and its tributaries and there is a heavy trade by caravan.

Under the Anglo-Egyptian convention of Jan. 19, 1899, the Sudan is administered by a governor-general appointed by Egypt with the assent of Great Britain. The British and Egyptian flags are flown together. Since 1910, when a governor-general's council was created, laws have been made by the Governor-General in Council. The Sudan is divided into 13 Provinces, each under a governor. Following the assassination of Sir Lee Stack in 1924, Egyptian troops in the Sudan were evacuated and a force of Sudanese under British officers was organized under the direct authority of the Governor-General. Governor-General in 1931, Sir John L. Maffey. See EGYPT.

**ANGOLA**, an-gô'là, or **PORTUGUESE WEST AFRICA**. A Portuguese colony on the west coast of Africa, situated between the Belgian Congo and South-West Africa. Area, 486,071 square miles; population (1926), 2,481,956 natives and about 40,000 Europeans. Capital, New Lisbon (Nova Lisboa), formerly known as Huambo; other important towns, São Paulo de Loanda, Cabinda, Ambriz, Novo Redondo, Benguela, Lobito, Mossamedes, and Porto Alexandre. The interior plateau lands are fertile and well watered. Lobito, considered the best natural port on the west coast of Africa, has replaced Benguela as the shipping point for southern Angola.

In 1930, there were 68 elementary schools for Europeans and 26 industrial and 20 agricultural schools for natives, with a total enrollment of about 5000. The principal products are coffee, rubber, wax, sugar, vegetable oils, coconuts, ivory, oxen, and fish. Mineral products include diamonds, malachite, copper, iron, petroleum, and salt. Gold also is found.

Imports in 1929 amounted to 314,216,000 escudos (about \$13,825,000 at escudo exchange rate of \$0.0447 in 1929) and exports to 281,920,000 escudos (about \$12,404,000). Trade is largely with Portugal. Budget receipts in 1928-29 were 163,612,860 angolares and expenditures 181,457,931 angolares (about \$9,816,000 and \$10,887,000, respectively).

Railway lines in operation in 1930 totaled 1436 miles. The Benguela Railway from Lobito was linked with the Katanga Railway in the Belgian Congo in March, 1931, affording a shorter outlet for the mineral wealth of Katanga and Northern Rhodesia, and completing the final link in a transcontinental system connecting Lobito with Beira on the east coast and with Cape Town on the south (see CONGO, BELGIAN). There are 18,000 miles of wagon and motor roads and 5790 miles of telegraph line. Government is in the hands of a governor-general, assisted by a partly elective consultative council. Headquarters are at Loanda. There is a military force of 740 Europeans and 6000 natives. Governor-General in 1931, José Dionísio Carneiro de Sousa e Faro.

**ANHALT**, an'hält. A State of the German Republic. See GERMANY under *Area and Population*.

**ANIMAL DISEASES**. See VETERINARY MEDICINE; LABRADOR; LIVESTOCK; and DAIRYING.

**ANNAM**, an-nām'. An Asiatic protectorate of France, forming a part of French Indo-China. (See FRENCH INDO-CHINA.) Annam's present status was established by the treaty of Feb. 23, 1886. Area, about 39,758 square miles; population in 1929, 5,425,000, including 4569 European civilians. Capital, Hué, with a population of 45,000 in 1929; largest town, Binh-Dinh, with 545,000 inhabitants in 1929. The principal port is Tourane.

Besides seven higher secondary and professional schools, with about 2243 students, there were in 1930, 754 preparatory schools with 29,797 pupils; 122 elementary schools, with 10,647 pupils; and 57 secondary schools, with 14,613 pupils. Products include rice, cotton, corn, and other cereals, the mulberry, the areca nut, cinnamon, tobacco, sugar, betel, manico. The forest products include coffee, dye, medicinal plants, caoutchouc, and cardamoms. Raw silk also is produced. Copper, zinc, coal, hematite, iron, gold, and salt are worked to some extent. Imports in 1929 totaled 115,737,000 francs (68,580,000 francs in 1928) and exports were 67,787,000 francs (63,029,000 in 1928). One franc equaled about \$0.0392. The local budget for 1930 balanced at 11,043,300 piasters (1 piaster equals \$0.39). Ships clearing the port of Tourane in 1929 had a total tonnage of 586,838. King Bao-Dai, who succeeded to the throne Nov. 6, 1925, is the nominal head of the government, and is assisted by a Council of Ministers, but actual power resides in the French Resident Superior. A Chamber of Representatives with limited powers was established in 1926. See FRENCH INDO-CHINA.

**ANNELIDS**. See ZOOLOGY.

**ANNIVERSARIES**. See CELEBRATIONS.

**ANSCHLUSS**. The movement for the political union of Austria and Germany, which found expression in 1931 in the Austro-German Customs Union proposal. See AUSTRIA, FRANCE and GERMANY under *History*.

**ANTARCTIC EXPLORATIONS**. See POLAR RESEARCH.

**ANTHROPOLOGY**. This was not a fertile year for anthropology: no news or views of particular significance were announced, expeditions were curtailed, and publication was at low level. Needless to say the reduction of activities was due to the general depression. Anthropology is peculiarly susceptible to variations in financial support; expeditions and to some extent publications being financed largely by private gifts. Naturally, this need not have affected the appearance of important findings, so that their absence this year may be laid to accident.

Several articles of theoretical significance appeared, largely as affirmations of aims. In emphatic reaction to the view that culture is a static structure refined by tradition, E. Sapir insisted on our recognition of it as a network of understandings between members of social units of whatever kind or degree of organization. It is not truly what it appears, a static sum of social institutions, but is reanimated or creatively reaffirmed by the interaction of its participants. Here the universal medium of social contact, language, serves as fully an effective mechanism among primitive peoples as among the most civilized. The principal aim of culture growth has been to connect originally discrete elements into larger systems common to the group, and to rationalize them in terms of familiar principles.

Among primitive peoples the opportunity for novel interactions is much less than among the civilized because each individual is more fully a participant in every phase of a uniform culture. Psychological conformity is correspondingly much greater in less sophisticated parts of civilized communities (*Encycl. Social Sciences*, iv, 78, 658).

In keeping with the self-consciousness that dictated the appearance of the *Encyclopædia of the Social Sciences* last year, *Methods in Social Science* (Chicago) attempts a scrutiny of the logical basis of anthropological concepts and techniques. The most interesting of these probings is that of A. L. Kroeber, who considers C. Wissler's formulations of the culture area concept and "age and area" interpretations. Both have come in for sharp criticism. Kroeber's judgment is that the culture area is a legitimate classificatory device as a first step toward analysis. The "age-area" concept is based on the well founded assumption that culture traits tend to diffuse: that of two traits the older has normally diffused farthest. Granting that Wissler has mechanically assumed that relative age and distribution are coördinated and has forced his data to make his point, Kroeber asserts the general soundness of the principle when due regard is had for (1) the true comparability of the traits concerned, (2) the contingencies of terrain and contact between peoples. The point has more than passing interest for by this method all inferential historical schemes of the American school have been built. At the same time, in another article Kroeber finds it essential to emphasize the less mechanical aspects of diffusion, the importance of which are easily underestimated. He points out that diffusion plays as important a part in conserving culture elements as tradition. Psychologically both rest on the same basis: imitation (*Encycl. Social Sciences*, v, 139).

Anthropology, like others of the social sciences, has been alert to attain the precision gained by the use of statistical methods. But early statistical attempts, such as those of Tylor and Czekanowski, proved abortive since the units used in calculations could not be defined. The majority of anthropologists see real difference in what is ostensibly the same culture trait, e.g. the use of masks, occurring among two peoples and serving as the basis of the statistical count. The difficulty is partially overcome when the elements counted form part of a single complex of traits which has apparently diffused over a single compact area. F. Clements has therefore returned to the problem with an inspection of *Plains Indian Tribal Correlations with Sun Dance Data* (*Amer. Anth.*, 33, 216). Coefficients of correlation and association, based on the presence of common elements of the Sun Dance among these tribes, show a close relationship among a group of northern tribes and again in a central group. Clements then bases an historical reconstruction on the degrees of relationship shown by these coefficients. The strictures that might be offered to this method are that it lends an air of accuracy to the historical formulation that is spurious, since the units of the count are neither sharply defined nor necessarily comparable, and that equally valid results are obtainable by mere inspection. Clements ignores the circumstance that the traits counted are not of equal weight;

some being fundamental to the ceremony, while others are details of relative insignificance.

The problem of comparative *Race Psychology* (New York) received attention at the hands of T. R. Garth. His adequate and temperate book summarizes all experimental investigations and significant points of view to date. The results are throughout negative. In summary, he finds no racial differences in sensory traits and no satisfactory quantitative difference in intelligence or intellectual concentration. Association processes and temperament are fairly well distributed in all races and there is no specific racial personality. Observable differences are, in his opinion, primarily the result of learned factors, i.e. education and culture.

Interest in this question is also evidenced by the announcement that the Uzbek Research Institute of Samarkand and the Moscow Institute of Experimental Psychology despatched a large group of investigators in July to Uzbekistan. There they will study the psychological characteristics of peoples at various levels of cultural development. Work is to begin among the primitive nomads of the Alai Mountains and the agricultural population on the River Narin.

A new journal, *Wira Kocha* (Lima, Peru), devoted to studies of Peruvian anthropology, made its appearance under the editorship of J. C. Tello. This balances the termination of *Indian Notes* (New York).

**PHYSICAL ANTHROPOLOGY.** Few finds of the fossil races of man were made during the year, but interest attaches to that of a Neanderthal child, dating from the later Pleistocene age, made by T. McGown in a cave at Athlit, near Mt. Carmel, Palestine. As the third child's skeleton discovered, it now becomes possible to investigate developmental processes in this race.

Even more important for anthropological progress than the discovery of new remains of fossil types is the publication of descriptions. A detailed account of an adolescent skull of *Sinanthropus* (Peking man), found in 1929, was made available by D. Black (*Palæontologia Sinica*, ser. D, 7, fasc. 2, Peiping). While it is evident that *Sinanthropus* and *Pithecanthropus* (Java man), both dating from early Pleistocene, resemble one another more than any other human type, the former is differentiated by its more generalized archaic character. Black still maintains that *Sinanthropus* is to be considered a distinct species of fossil man. A description of the Neanderthal skull found at Saccopastore, near Rome (announced 1929) by S. Serji (*L'Anthropologie*, 41, nos. 3-4), indicates that it is one of the best preserved skulls of this race. The cranial capacity of 1200 cc. is the smallest yet known, and combined with its general refinement, makes for the probability that this was a woman's skull. Unlike most Neanderthal specimens, it appears that the carriage of the head was erect as in modern man.

On the relation of man and the apes, there was the interesting suggestion that the difference in the time at which teeth erupt results from the relative lengths of jaws (M. Degerböl, *Meddelelser om Danmarks Antropologi*, Copenhagen, iii, 2, 235). In apes the eruption and loss of the deciduous teeth and the appearance of the permanent is a continuous process. This is possible because the permanent set comes into place behind the milk teeth in their long jaws. In man

the eruption of the permanent set, delayed for years, hinges on first shedding the milk teeth they replace and on the growth of the jaw necessary to accommodate them.

The problem of populational trends over a long span was attacked by E. A. Hooton in his consideration of the skeletal remains from *The Pueblo of Pecos* (New Haven). This New Mexican site was occupied for some ten centuries. It appears "that the population became more and more homogeneous in cranial characters and more and more diversified in other skeletal features." Appended to this study is a general statement on the peopling of the New World. Hooton interprets the slender evidence for the precedence of long headed types over broad headed as an early invasion of pseudo-Australoids ("an archaic form of modern man"), containing a Negroid (not Negro) strain, compounded with a type related fundamentally to the Mediterranean race. Following this came an influx of brachycephalic people of Mongoloid type. The last wave of immigration brought the somewhat specialized Eskimo. The alternative possibility that these resemblances to Old World types may have risen independently by a convergent development does not appear to have been seriously considered.

A further contribution to the origin of the Eskimo was offered by H. L. Shapiro (*Anth. Papers Amer. Mus. Nat. Hist.*, 31, pt. 6) on the basis of measurements of the present populations. He points out that the striking similarity of such widely placed groups as "modern Eskimo from Smith Sound [north Greenland], Coronation Gulf [north coast of Canada], and Seward Peninsula [west Alaska], and the Chipewyan Indians from Lake Athabasca [north central Canada] suggests that the immediate origin of these Eskimo must be placed in the interior of Canada west of Hudson Bay." This agrees with current ethnological conclusions regarding the Eskimo as a whole. Shapiro adds, however, that the migration from this district "seems to be recent and superimposed upon an earlier distribution of Eskimo" of different type.

OLD WORLD ETHNOGRAPHY. For the most part contributions to this field have been brief and scattered. The interest in M. Mead's study of *Social Organization of Manua* in Samoa (*Bishop Mus., Bull.* 76) lies in its emphasis on the antithesis of individual behavior with the formal social structure. Samoan organization is highly flexible and serves as an instrument for political intrigue and personal ambition, despite the seeming stability evidenced by its traditionalism. The stress on the dynamic flow of this culture rather than on its crystallized institutional aspects reflects the influence of F. Boas.

Two volumes on tribes of Northern Nigeria by C. K. Meek (*A Sudanese Kingdom and Tribal Studies in Northern Nigeria*, London) present a general account of the Jukun, as well as detail of the social organization and languages of a large number of little-known tribes.

Extended accounts of tribes of South Africa are rare, though not surprisingly so in view of the breakdown of native society by white settlement. Hence the value of H. A. Stayt's *The Bavenda* (London), a Bantu tribe still preserving their native culture in the Zoutpansberg Range of North Transvaal.

NEW WORLD ETHNOGRAPHY. Scientific study of North American ethnography dates only from

the opening of the present century. Investigations into the manners and customs of the Indians have now been carried on in practically every part of the continent. Even in eastern United States where many tribes are nearly extinct, a surprising amount of information has been systematically collected. The largest areas still unsurveyed are the northern interior of Canada, the Great Basin of western United States, and the southern Plains region. That these areas will not long remain neglected is evidenced by activities of the current year; e.g. the appearance of Birket-Smith's account of the Chipewyan of Canada and Lesser's investigations of the Plains Caddoans.

During the last decade the most systematic surveying has gone on in the United States west of the Rockies. Due primarily to the efforts of the State University, California has received the major share of attention, so that to-day something is known of practically every Indian group resident within its borders and full accounts are available from half a dozen tribes. Little more can be done, however, in the region of old Mission influence, where the natives are either extinct or have lost almost the whole of their aboriginal culture.

Descriptive surveying of Washington was well under way, although most of the available accounts of tribal customs were still random and incomplete. Practically nothing had yet been attempted in Oregon. While it was still possible to collect information east of the Cascades, the natives of the western half of the State were annihilated or so shattered in the wars of the 1850's as to preclude a complete survey. Systematic efforts were still possible in the mountain States. This holds also for the Great Basin, where the lowly culture of the Indians of Nevada and Utah had never proved attractive. Much of this area may have been unoccupied.

Arizona contains a greater number of tribal groups still nearly aboriginal than any other State in the union, yet reasonably complete accounts are available from only three or four. Here however there has been a concentration of effort on the part of a number of eastern institutions, so that a few years should see most of the area satisfactorily described.

One of the least known regions, the northern interior of Canada, is by no means easy territory to work, since the natives are few and scattered and difficult of access. The culture has often been dismissed as little more than an undeveloped survival of the primitive culture of the ancestral Indians immigrant to this continent. K. Birket-Smith's *Contributions to the Ethnology of the Chipewyan* (*Rept. Fifth Thule Exped.*, Copenhagen, vi, no. 3), which presents the first reasonably full account of a people of this area, shows, that while the culture is indeed simple, it has at every point distinctive elements.

How far the culture of the Algonkins of the Great Lakes extended in this direction was investigated by J. M. Cooper. To him it seems that the culture of the Athabaskans of the Mackenzie Basin is essentially one with that of the Algonkins. Hunting territories, for instance, are inherited as among the Eastern Algonkin, and types of hunting magic and divination are shared by the two.

In older literature the Seri of the west coast of Mexico occupied an exaggerated place as a

people of animal-like endowment, "more dominated by instinctive impulses and less capable of cultural development than other peoples." This because of McGee's tenuous conjectures, based on a fleeting visit in 1894. Happily A. L. Kroeber restores sanity to the picture in a brief account (*Southwest Museum Papers*, Los Angeles, no. 6) which shows them essentially the same as other desert dwellers of northwest Mexico and Arizona.

In *A Sketch of Northern Sahaptin Grammar* (*Univ. Wash. Publ. Anth.*, 4, no. 2) M. Jacobs groups the Sahaptin dialects of Washington in a unit coördinate with Nez Percé of Idaho (together forming Powell's Shahaptian stock) and reaffirms their genetic connection with Molala-Cayuse and Klamath-Modoc southward in Oregon. The term Sahaptin is thus extended to include this larger linguistic family of three major divisions.

Shoshonean, as one of the most widely flung linguistic divisions of west North America, offers exceptional opportunities for studies of primitive dialectic variation. E. Sapir offers a grammar of Southern Paiute as a norm on which such studies may be based (*Proc. Amer. Acad. Arts and Sciences*, 65, no. 1). Beside many novel elements of analysis it presents the first full grammar of any Shoshonean tongue.

Chronology within a local area was amplified by *Recently Dated Pueblo Ruins in Arizona* (E. W. Haury and L. L. Hargrave, *Smithson. Misc. Coll.*, 82, no. 11) which fix the Pueblo III period (Great Period) in the Little Colorado drainage as middle thirteenth to early fifteenth centuries A.D. Since these ruins contained pottery painted with lead glaze all doubt is now removed that lead glazing in the Southwest antedates Spanish influence.

A survey of a wide area, on the other hand, was W. K. Moorhead's *Archæology of the Arkansas River Valley* (New Haven). Here in succession were found along the river a series of cultures ranging from typical mounds of Southeastern type to Pueblo remains in the headwaters. Unfortunately no precise delimitation of types or succession in time was forthcoming as a result of the survey.

The reputed contemporaneity of artifacts and fossil remains of Pleistocene animals at Frederick, Okla., is repudiated by O. F. Evans (*Jour. Wash. Acad. Sci.*, 20, no. 19) who maintains that the gravels are a redeposit made after a period of post-Pleistocene uplift. The artifacts and fossils had originally a purely accidental association, and were redeposited where they were found by an eroding stream. Hence, once again, the age of the fossils associated with the remains of man prove no index that America was occupied in Pleistocene times.

The archaeological history of Peru continues as a laborious and inferential fitting together of fragments from local areas. Such it will continue to be until the discovery of definite stratigraphic evidence, which will decisively reveal the main lines of the mosaic. On the northern coast, A. L. Kroeber finds Chimú culture; its early and middle phases extending over the southern half of that area, its late phase over the whole. The middle phase is less local in its outlook than the first, bearing evidence of highland influence on the coastal strip; the late phase is a renaissance of early Chimú, its influence now extending to the southern coast (*Mem. Field Mus.*, ii, no. 2).

**EXPEDITIONS, PERSONALIA.** The expedition of the Naturhistoriska Riksmuseet (Stockholm) in China and Mongolia continued under S. Hedin. Important collections illustrating the lamaistic cult and the culture of the Tebbu (on the Chinese-Tibetan border) were made. G. Bolinder concluded his expedition to Sierra Leone, Gold Coast, and Nigeria in West Africa. During the year E. Nordenskiöld and K. G. Izikowitz of the Gothenburg Museum (Sweden) investigated the religion and language of the Cuna of Panama. Collections were received from field representatives among the Apinagá and Canella (e. Brazil), Chipaya and Siriono (Bolivia), and archaeological material from Colombia.

Greenland was as usual the centre of Danish activity. The southern coast was visited by the Sixth Thule Expedition under K. Rasmussen. Ethnological work was done with the few surviving Eskimos of Cape Farewell and extensive excavations made at Linderrow Fjord by M. Høivæd. Further archaeological work was begun at Angmagsalik (central e. coast) by T. Mathiasen and at Clavering Island (northeast coast) by H. Larsen. W. Thalbitzer continued his studies of West Greenland dialects. The Museum für Völkerkunde (Leipzig) dispatched E. Erkes to China for the study of Taoism. Collections made by C. Nimuendaju were received from the Canella and Schavante (Ges tribes of eastern Brazil). The Staatliches Forschungsinstitut für Völkerkunde (Leipzig) fostered several African expeditions: J. H. Wilhelm among the Okavango (Southern Angola), B. Struck and A. H. Bernatzik to Portuguese Guinea and the neighboring Bissagos Islands, and G. Spannaus and K. Stölper to the Vandau and Baschleungwe (Portuguese East Africa).

The British Museum's fifth expedition to British Honduras under T. E. Joyce returned in May after excavating at Pusilhá. The Institut d'Ethnologie (Paris) furthered the African researches of M. Griaule in Daka-Djibouti, M. Cochain in Hoggar, Mlle. Jouin in Morocco, and Mlle. Dijour in British Columbia.

The activities of the Dirección de Monumentos Prehispánicos of Mexico were directed to excavations of ruins at the Pyramid of Tenayuca (D. F.), Calixtlahuaca (Mexico), Cholula (Puebla), Monte Albán (Oaxaca), with further extended excavations at Chichén Itzá (Yucatan).

For the American Museum of Natural History (New York) H. J. Bockelman investigated shell-heaps on the east coast of Central America and G. C. Vaillant near Ticoman in the Valley of Mexico. R. M. Snodgrass reported the occurrence of artifacts of Folsom type (of possible Pleistocene age) from El Paso to southern Wyoming. H. L. Shapiro continued his studies of oriental types in the Hawaiian Islands and in Japan and China. M. Mead returned to New Guinea for ethnological research. The Museum of the American Indian (New York) joined the University Museum (Philadelphia) in dispatching G. Mason to Venezuela and Colombia for ethnology; H. S. Dickey explored the Orinoco and F. Johnson visited the Micmacs of Newfoundland.

The University Museum (Philadelphia) had a large number of expeditions in the field in co-operation with other institutions. In Iraq (Mesopotamia) they excavated at Ur, at Tar Khalan near Kirkuk, at Tell Billa near Mosul, at Tepe Gawra; in Palestine at Beisan and Mugharet-el-Wad near Jerusalem; in Persia at

Damghan; in Egypt at Meydum. Other archaeological and ethnological studies were made among the Tlingit and on Prince William's Sound, Alaska; to the Matto Grosso (South America); and to Piedras Negras (Guatemala).

The Bureau of American Ethnology (Washington) made two staff additions, W. D. Strong and W. M. Walker. Linguistic and ethnological investigations were carried on by J. R. Swanton among the Chitimacha and Tunica (Louisiana), T. Michelson among Cheyenne, Fox, and Kickapoo (Iowa and Okla.), J. P. Harrington among surviving groups of southern California, and J. N. B. Hewitt among the Iroquois (Ontario, N. Y.). Archaeological reconnaissance was conducted by M. W. Stirling in the southern States and Haiti, by W. D. Strong in the Dakotas, and N. M. Judd in southeastern Arizona, while W. M. Walker excavated in Arkansas and Louisiana, F. H. H. Roberts in eastern Arizona, and F. M. Setzler on the Gulf coast near Brownsville, Texas.

The Carnegie Institution of Washington continued its primary activities in the Maya field, Yucatan. Further excavations were made at Chichén Itzá and Yaxchilan by S. G. Morley and by A. L. Smith at Uaxactun (Guatemala). O. G. Ricketson prepared the ground for excavations in the Guatemalan highlands. Among the living Maya, R. Redfield investigated sociological conditions, M. Andrade linguistics, and M. Steggerda physical anthropology and basal metabolism.

The Field Museum (Chicago) also operated in this area, with J. E. Thompson at San José, western British Honduras, and in Guatemala. P. S. Martin continued excavation at the Lowry ruin (southwestern Colorado). Further excavations at Kish (Iraq) in cooperation with Oxford University were made by S. Langdon. In these ruins, which extended back to 4000 B.C., was found evidence of connection with India about 2800 B.C. and on another level a Persian palace of Sassanian dynasty (*circa* 350 A.D.). A study of the physical anthropology of the same region by H. Field shows that the modern inhabitants had changed little from those of ancient Kish. The Southwest Museum (Los Angeles) continued exploration of Gypsum Cave (near Las Vegas, Nevada) under M. R. Harrington, where human remains were found in association with extinct animals. A reconnaissance of the archaeology of the Californian desert was made by W. H. Campbell.

American universities continued active. For Columbia University, F. Boas investigated the Kwakiutl (British Columbia), G. Reichard the Navaho and R. Underhill the Papago (Arizona), R. Benedict the Mescalero Apache (New Mexico), and P. Gordon the Comanche (Okla.). R. Bunzel was occupied with ethnology in Guatemala and E. C. Parsons in Oaxaca. J. M. Cooper of the Catholic University (Washington) revisited the Tete de Boule (Ontario) and extended his survey as far as Great Slave Lake. At the University of Pennsylvania, F. G. Speck studied language and ethnology of the Catawba (South Carolina), Montagnais-Naskapi (Quebec), and Delaware (Okla. and Ontario).

The University of Chicago had F. C. Cole conducting excavations in mounds of central Illinois, C. Wisdom studying the ethnology and language of the Chorti (Guatemala), K. Oberg the economic system of the Tlingit (Alaska), and B. Haile the language of Jicarilla Apache and

Navaho (New Mexico). An expedition to the Djabo (eastern Liberia) under G. Herzog returned with rich linguistic and musical material. W. Bennett and R. Zingg studied the culture and language of the Tarahumare (Chihuahua), and the latter continued an archaeological survey over a wider area.

For the University of California, E. M. Loeb gathered material on Patwin and Maidu ceremonialism (California), R. Beals on the Mayo (Sonora), and L. M. O'Neale on textiles in Peru. R. L. Olson joined the university staff. Perhaps the most significant movement among the universities was the establishment of a graduate division of anthropology at Yale under E. Sapir.

The Committee on Research in Native American Languages reported expeditions for linguistic purposes to the Tonkawa (Texas), Apache and Lipan (New Mexico-Chihuahua: H. Holjer), to the southern Caddoans and Pawnee (Nebraska-Oklahoma: A. Lesser and G. Weltfish), Natchez (Mississippi: V. Riste), to the Siouan Dakota and Crow (South Dakota-Montana: E. Deloria and R. H. Lowie), to the Patwin, Pomo, Yuki, and Yokuts (California: P. Radin, J. de Angulo, M. Uldall, and S. Newman), to the Washo (Nevada) and Wishram (Washington: W. Dyk), to the Tillamook and Cayuse (Oregon: M. Mandelbaum and M. Jacobs), Nez Percé (Idaho: A. Phinney), Interior Salish (Washington: V. Ray and V. Walters), and to the Nitinat (British Columbia: M. Swadesh).

NECROLOGY. Emil Torday, by birth a Hungarian, a distinguished authority on Africa, died May 9, aged 56. His best known work was an ethnography, *Les Bushongo*. England lost A. P. Maudslay, known for his investigations of Mayan and Aztec sites in Mexico and Central America, on January 23, aged 81. Herman F. C. ten Kate, born in Amsterdam, was a physical anthropologist, whose field work was chiefly in America and the Dutch East Indies. He died at Carthage, North Africa, on February 5, aged 72. Josef Bayer and Franz Heger, both connected with anthropological activities of the Natural History Museum, Vienna, died, the former on July 23. George A. Dorsey (q.v.), who as curator at the Field Museum, Chicago (1898-1915), was largely responsible for the amassing of their extensive anthropological collections, died March 29, aged 63. His scientific writing was principally on Plains Indian ceremonialism; his most popular book *Why We Behave Like Human Beings*.

ANTIGUA. See LEEDWARD ISLANDS.

ANTIOCH COLLEGE. A nonsectarian co-educational institution in Yellow Springs, Ohio, founded by Horace Mann in 1853 and reorganized in 1920 by Arthur E. Morgan with the aim of embodying anew the educational philosophy of its first president. The number of students enrolled for the first semester of 1931-32 was 586, of whom 371 were men and 215 women. The faculty had 88 members. The productive funds of the institution amounted to \$264,401, and the operating income for the year was \$422,886. The library contained approximately 37,000 volumes. Research projects closely associated with the school were established in the fields of physics, chemistry, biology, and medicine, and approximately \$540,000 was made available to complete their studies. Antioch College is conducted on the belief that academic training alone does not fit the student for life, and is so organized that the student divides his time between liberal and

professional studies at college and practical work in the professional, industrial, and commercial institutions of the central and eastern States. An extramural faculty normally supervises the location of students in about 175 firms and institutions in 15 States during these work periods, which alternate with study periods in five-week intervals. President, Arthur E. Morgan, D.Sc.

**ANTIQUES.** See ART EXHIBITIONS; ART MUSEUMS; ART SALES.

#### **ANTI-SALOON LEAGUE OF AMERICA.**

A federation of churches and temperance organizations in the United States, united against the beverage liquor traffic. It was established in 1895 by a coalition of the anti-saloon leagues of four States and the District of Columbia. At the end of 1931 it embraced 48 State or territorial leagues and had affiliation with 40 other national temperance organizations, as well as with the World League against Alcoholism (q.v.).

During 1931 the work of the league, which was conducted by more than 2000 representatives, included a widespread educational campaign on the evils of the use of alcohol and the duty of observance of the law, carried on through the press, the pulpit, the lecture platform, by radio, and the drama. Its legislative programme emphasized support of the measures urged by President Hoover for the better enforcement of national constitutional prohibition. These included the Reorganization Act of 1930, providing for the transfer of the investigative functions of prohibition enforcement from the Treasury Department to the Department of Justice, which became effective on July 1, 1930; the Stobbs Act, to define petty offenses under the prohibition law with a view to bringing them within the proposed enlarged powers for United States commissioners, which became effective Jan. 15, 1931; and House of Representatives bill 10341, to define petty offenses against the penal statutes of the United States, so that the same procedure would apply to all petty criminal offenses, as was suggested by the Commission on Law Observance and Enforcement with respect to minor offenses under the prohibition law, which became effective Dec. 16, 1930.

The league issued statistics, based on official reports, demonstrating that consumption of intoxicants had dropped to a small fraction of its former total and giving the consequent economic, social, moral, and physical benefits of prohibition to the people of the nation. The league centred its activities on the organization of local and State groups for the encouragement of enforcement authorities and the support and expression of popular opinion on prohibition. In addition to many thousands of leaflets, documents, and books distributed, it published *The American Issue* in Westerville, Ohio, with a monthly circulation of about 1,000,000 copies and with State editions in 24 States.

The officers of the league in 1931 were: President, Bishop Thomas Nicholson, Detroit, Mich.; secretary, S. E. Nicholson, Media, Pa.; honorary treasurer, Foster Copeland, Columbus, Ohio; treasurer, H. B. Sowers, Westerville, Ohio; general superintendent, F. Scott McBride, Washington, D. C.; director of the department of education, Ernest H. Cherrington, Washington, D. C.; attorney, Edward B. Dunford, Washington, D. C. See PROHIBITION.

**ANTI-SEMITISM.** See JEWS; also POLAND.

**AOSTA, 18-08-tà, EMANUELE FILIBERTO, DUKE OF.** An Italian prince of the House of Savoy and cousin of King Victor Emmanuel III, died in Turin July 4, 1931. He was born in Genoa Jan. 13, 1869, son of Amadeus, Duke of Aosta, who was King of Spain from 1870 until the Republican revolution of 1873. Adopting a military career, he successively commanded the 1st Army Division at Turin and the 10th Army Corps at Naples. When the World War began he was on the retired list, but was later appointed to the command of the 3d Army to succeed General Zuccari. He remained in that position throughout the War and won the admiration of the nation when after the Caporetto disaster in October, 1917, he succeeded in extricating his army intact. On reaching the Piave River, during the retreat, this army bore the brunt of the fighting in holding the Italian main line against further Austro-German advance. It also played an important part in the Allied counter-offensive, leading to the final victory at Vittorio on Oct. 30, 1918, and was named the "Unconquered Army." In 1926 the Duke of Aosta was made a marshal.

**APPENDICITIS.** See SURGERY, PROGRESS OF.

**APPLES.** See HORTICULTURE; ENTOMOLOGY, ECONOMIC.

**AQUEDUCTS.** Four great American aqueduct projects were noted in the 1930 YEAR BOOK—those for the supply of New York, Boston, San Francisco, and Los Angeles. These are all major projects, which rank among the largest works of their kind in the world, and attention naturally centres on them.

**NEW YORK.** The proposal, outlined in the 1929 YEAR BOOK, to secure an additional supply for the Greater New York area by tapping the tributaries of the Delaware River in the Western Catskills, was held up due to interstate difficulties. The special master appointed by the U. S. Supreme Court to hear the arguments of the three States interested—New York, New Jersey, and Pennsylvania—recommended the allowance of a limited diversion by New York in a report dated February 2. This decision has a far-reaching importance in connection with water rights in the Eastern States as it undoubtedly establishes, and for the first time, the basis on which interstate rights will hereafter be apportioned.

New York had proposed to divert 600 m.g.d. (million gallons daily) from the Delaware source. In order, however, to protect the rights of the other States on the Delaware River, considering that river both as a waterway and as a future source of water supply within these States, the allotment to New York was reduced to 440 m.g.d. It was also required that New York should maintain a minimum flow below the points of diversion in the streams affected, by releasing water, during periods of drought, from the reservoirs to be constructed. This report was sustained by formal action of the Supreme Court on May 5.

The New York authorities were thus faced with the problem of determining whether the cost of the new Catskill supply, thus limited in amount, justified this construction as against some other possible source. Apparently the only other source would be in the Adirondacks and it was announced that the city authorities would develop the Delaware supply as rapidly as land could be acquired for the works. For outline of this proj-

ect, which involves an aqueduct longer and larger than the Catskill aqueduct of 1905-17, see 1928 YEAR BOOK.

Satisfactory progress was also made during the year in driving the deep 20-mile water distribution tunnel under New York City which will join Hill View Reservoir with the terminal point of Tunnel No. 1 at Fort Greene Park, Brooklyn. This 15 to 17 feet circular bore was being driven from 19 shafts, and, with Tunnel No. 1, will form a huge tunnel loop under the Bronx, Manhattan, Brooklyn, and Queens, from which water will be supplied to the distributing mains in the city streets. A new method of distribution thus was developed to meet the needs of this greatest urban centre and free the streets of dangerous, long, multiple lines of distribution pipe.

The extraordinary conditions brought about by the low flow of the streams supplying New York, particularly during the early part of the year, should also be noted. The flow was so reduced as to equal the worst drought on record since 1868. The seriousness of the situation is reflected in the following figures showing comparative yields.

Month	Average yield M. G. D.		
	Schoharie	Esopus	Croton
January, 1930 .....	416.1	343.5	400.9
January, 1931 .....	37.5	17.8	209.2
February, 1930 .....	296.6	246.2	376.4
February, 1931 ...	65.0	95.5	430.0

During the period from July 1930 to March 1931, stream flow in the Catskill system (Schoharie and Esopus) averaged only 60 per cent of normal. Furthermore, stored water in the Catskill reservoirs, at the end of March, to meet the normal summer demands and low flow, amounted to approximately 27,000 m.g. as compared with 120,000 m.g. in the previous year.

Accordingly emergency measures were taken to make additional water available from wells in Long Island and a pumping plant was also established between the Croton gate house and the Catskill aqueduct near Kitchawan, N. Y. Surplus Croton water was thus made available in the high level Catskill line. The city's normal consumption of 930 m.g.d was also reduced to 860 m.g.d by eliminating street flushing and other non-essential uses by city departments. Heavy rains during late April and early May relieved the situation.

BOSTON. The diversion of water from the Swift and Ware Rivers, tributaries of the Connecticut, for the additional supply of the Boston Metropolitan area, was upheld, without prejudice, by the U. S. Supreme Court in a decision of February 20. It was held that this diversion would not result in substantial injury to the State of Connecticut. Bids were opened March 26 for the construction of the connecting aqueduct tunnel between the Swift and Ware Rivers, and the work was thus going rapidly forward. This decision, with that affecting New York, constituted the first ruling on interstate waters in the East where the time-honored principle of riparian rights was set aside. It substituted therefor a broader policy based on economic justification irrespective of either State boundaries or riparian law.

SAN FRANCISCO. At the beginning of the year, San Francisco's new aqueduct was nearly half way through the last 28¼-mile mountain barrier.

This Hetch-Hetchy line, described in previous YEAR BOOKS, had been under way for almost 20 years. In its 156 miles of line no less than 85 miles is in tunnel.

While the extraordinary drought of 1930-31 was causing much concern in New York, as noted above, the San Francisco area was experiencing an equally dangerous period of low flow following a series of years of great dryness. This caused an emergency which had not been foreseen and forced the city authorities to make a hurried and expensive connection with the East Bay Municipal Utility District system as well as to approve an emergency pipe line over the coast range mountain barrier to bring Hetch-Hetchy water to the city, pending the completion of the tunnel above noted. Through the East Bay connection, rushed to completion in 100 days, some 10 m.g.d was purchased for San Francisco. The Hetch-Hetchy 45 m.g.d. emergency line was 25.9 miles long and required a pumping lift of 1325 feet. This latter construction also involved rushing the completion of the 47½ mile San Joaquin siphon, described in the 1930 YEAR BOOK and about half completed, in order to complete the Hetch-Hetchy line to the city.

It was unfortunate that this shortage had to be met by these extraordinary expenditures as the Hetch-Hetchy supply, when finished, will meet the demands of San Francisco for years to come.

LOS ANGELES. The selection of the so-called Parker route for the record-breaking Colorado River-Los Angeles Aqueduct, was noted in the 1930 YEAR BOOK. It was estimated that the construction of this 265.5 mile line would require six years and that two years would be necessary for preliminary studies and plans. Road construction, and other work preliminary to construction, was started September 30. An immense amount of such work was necessary in order to reach the isolated area in which the line is located. This first activity was made possible by the passage on September 29 of a \$220,000,000 bond issue to finance the work. It was claimed that the greatest campaign of publicity ever undertaken was carried out by the Metropolitan Water District of Southern California in order to secure this construction. In spite of much opposition and the nation-wide depression, the vote was 5 to 1 in favor of this stupendous undertaking.

ATHENS, GREECE. The work which had been going forward in this classical centre of the Old World has been noted in previous YEAR BOOKS. (See *Marathon Dam*, under DAMS, 1929). Several years previously the ancient aqueduct built by the Roman Emperor Hadrian was cleaned out and partly rebuilt. The new work, however, involves a strictly modern system consisting of a storage reservoir formed by the Marathon Dam, a 20-mile aqueduct from the dam to the city, and a filtration plant and service reservoir at the city.

The most interesting part of the aqueduct is the 8.37 mile Boyati Tunnel which cuts through the long low saddle between the Parnes and the Pentelikon Mountains. It is said to be the longest hydraulic tunnel in Europe. Great difficulty has been encountered in this work due to the heavy and unstable ground through which it passes. One area, in the north section, of squeezing ground with large inflows of water, forced the selection of a new line around this obstacle. A shaft was sunk to the south and the southern portion of

the tunnel was holed through to this shaft on April 2. Work then went forward on the new northern alignment. Ulen and Co., are the contractors on this interesting \$11,000,000 work, and they are also under contract to manage the water supply for 25 years. See **WATERWORKS AND WATER PURIFICATION**.

**ARABIA.** A peninsula in southwestern Asia situated between the Red Sea and the Persian Gulf. The area is estimated at from 1,000,000 to 1,200,000 square miles, the higher figure including the Syrian Desert and the Sinaitic Peninsula. A mountain barrier, parallel to the Red Sea, runs the length of the western part of the peninsula from which the terrain slopes uniformly to the Persian Gulf, with the exception of the Oman district in the extreme southeastern part of Arabia, where a mountainous area with 10,000-foot peaks is found. Barren and sparsely watered, the peninsula nevertheless has numerous large oases. Estimates of the population range from 4,000,000 to 7,500,000. The inhabitants represent every stage of transition from the purely nomadic Bedouin tribes, occupying a large part of the interior, to the well-developed civic life of the large towns. Freed of Turkish control by the World War, the Arabs were at liberty to work out their own political destiny. After six years of internecine warfare, the Ibn Saud dynasty of Nejd emerged as the ruling power, controlling all the peninsula except several small states along the southern and eastern coastal fringe. During this period, the divisions of Arabia became defined as follows:

**KINGDOMS OF HEJAZ (HEDJAZ) AND OF NEJD.** The Kingdom of the Hejaz, founded by King Hussein Ibn Ali in 1916 as the outgrowth of the World War, was conquered at the end of 1925 by Abdul Aziz Ibn Saud, Wahabi leader and Sultan of Nejd. Ibn Saud, on Jan. 8, 1926, was proclaimed King of Hejaz and Nejd. He maintains two capitals at Mecca (Hejaz) and Riyadh (Nejd).

Hejaz occupies the western coast of Arabia between Trans-Jordan on the north and Asir on the south, the latter boundary touching the coast at about 20° north latitude. The estimated area is about 150,000 square miles, although the land frontiers have never been definitely defined, and the population, largely composed of nomads, is placed at from 800,000 to 1,000,000. The chief cities, with their estimated populations, are Mecca (85,000), the holy city of Islam; Medina (30,000), site of Mohammed's tomb; and Jeddah (25,000), the seaport for Mecca. Mecca is visited annually by about 100,000 Moslem pilgrims from abroad, who represent the chief source of revenue for the government. The standard gold currency is the pound sterling, which is equivalent to 10 rials in native currency. Agriculture is confined to the mountain oases and valleys, which produce fruits, dates, and some cereals. Hides, wool, gum, and clarified butter are the leading Bedouin products. Some Arab horses are exported. Imports of the Hejaz are estimated at from \$13,000,000 to \$15,000,000 annually. The southern section of the railway from Amman, Trans-Jordan, to Medina, has been out of commission since 1925. Of a total of some 1055 miles of highway in Arabia in 1930, only 30 miles (mostly in the Hejaz) were graded or drained.

The Kingdom (formerly Sultanate) of Nejd occupies the highland of Central Arabia, with an indefinite area and a population estimated

at 3,000,000. Riyadh, the capital, and Hufuf have populations of about 30,000 each. Dates, wheat, barley, fruits, hides, wool, horses, and camels are the chief products, a few of which, particularly camels, are exported.

The Nejd is governed in patriarchal fashion by the King, acting through Emir Saud, his eldest son, who resides at Riyadh as Viceroy. The Hejaz, however, has a Constitution issued Aug. 29, 1926, which vests all administrative powers in the King. There are six Departments of State and advisory councils of notables and officials approved by the King, including a consultative legislative assembly at Mecca, municipal councils in Jeddah and Medina, and numerous tribal councils.

**ASIR.** A province on the west coast between the Hejaz and Yemen, formerly ruled by the Idrisi dynasty but since 1926 a protectorate of the Kingdom of Hejaz and Nejd. Estimated population, 1,000,000; capitals, Abha and Sabiya. Under an agreement reached between the Idrisi and Ibn Saud, Asir was practically annexed to the Hejaz in 1930.

**YEMEN.** The Imamate of Yemen is an independent Arab state occupying the Red Sea coast between Asir and the British protectorate of Aden. The area is about 75,000 square miles and the population between 2,000,000 and 3,000,000. Sana', the capital, has about 25,000 inhabitants. Barley, wheat, millet, coffee, and hides are the principal products and exports. Ruling Imam in 1931, Yahya Hamid ed-Din.

**THE HADRAMAUT.** A region of fertile valleys to the east of Aden Protectorate, the greater part of which is ruled by the Sultan of Makalla. The territory is under loose British protection and control.

**OMAN.** An independent state occupying the coastal fringe of southeastern Arabia; under the protection of Great Britain. Area, about 82,000 square miles; population, estimated at 500,000, chiefly Arabs but with a considerable Negro element along the coast. Muscat, the capital, has about 10,000 inhabitants, most of whom are Negroes or Baluchis. Exports, consisting of dates, dried limes, pomegranates, and dried fish, are exchanged principally with India. In 1929-30 imports were valued at £317,295 and exports at £142,151. Revenues total approximately 1,000,000 rupees (\$365,000) annually. The reigning Sultan in 1931 was Seyyid Sir Taimur bin Feisal, who succeeded to the throne Oct. 5, 1913.

**KUWAIT.** An Arab territory fringing the northwestern coast of the Persian Gulf, with an estimated population of 50,000. The Sheik, Ahmed ibn Jabir al Subah, is subsidized by the British government. Capital, Kuwait.

**BAHRAIN ISLANDS.** An island archipelago in the Persian Gulf 20 miles from the Arabian coast; under British protection. The total population of about 120,000 is ruled by Sheik Hamad bin Isa al Khalifa. Capital, Manama (population about 20,000). The islands are the centre of the pearl-fishing industry of the Persian Gulf.

For other Arab or partially Arab states, see also **IRAQ, PALESTINE, TRANS-JORDAN, and SYRIA.**

**HISTORY.** Unwonted peace reigned throughout the Arabian peninsula during 1931. From the broad domains of Ibn Saud came no rumor of tribal insubordination such as that which led to the King's chastisement of Feisal ed-Dowish and his followers in 1930. The treaty with Iraq

signed the previous year resulted in a distinct improvement in the relations of the two principal Arab kingdoms. No recurrence of raids by Bedouins from the Nejd and Hejaz across the Iraqi and Trans-Jordan borders was reported and in April Prime Minister Nouri Pasha of Iraq made an official visit to the Hejaz and the Yemen. Opposition newspapers in Bagdad hinted that Nouri Pasha's trip was intended to promote a Pan-Arab union under British auspices.

Ibn Saud took advantage of the period of peace to modernize the communications of the Hejaz and Nejd. The Marconi company during 1931 was engaged in the erection of 15 wireless stations in the principal centres of the kingdom. Marconi officials undertook the training of Arab wireless operators at Jedda and the entire system was to have been in operation by the end of the year.

An important event of the year was the death at Amman, Trans-Jordan, on June 4 of Hussein ibn Ali, Sherif of Mecca from 1908 and King of the Hejaz from 1916 until his abdication in 1924 (see HUSSEIN IBN ALI). Still another was Bertram Thomas's exploration of the Ruba-el-Khali (see EXPLORATION).

It was announced in Washington May 3, 1931, that the United States had extended full diplomatic recognition to the Kingdom of the Hejaz and Nejd. The action was apparently prompted by the expansion in the Arabian demand for American manufactures, many American automobiles having been imported for use in transporting pilgrims between Jedda and the holy city of Mecca. For developments in other Arab or partly Arab states, see IRAQ, PALESTINE, TRANS-JORDAN, and SYRIA.

#### ARACHNIDS. See ZOOLOGY.

**ARBITRATION, INTERNATIONAL.** The League of Nations was encouraged by the development of the methods of peaceful settlement, especially in 1930, following from the number of States bound by the General Act of September 6, 1928, from the number of States bound by Article 36 of the Statute of the Permanent Court of International Justice relating to the compulsory jurisdiction of that court in legal disputes, and according to *The Advocate of Peace*, from the number and quality of the treaties registered with the League. In 1930 the number of States bound by the General Act rose from three to eight. The three States bound on Dec. 31, 1929, were Sweden, Belgium, and Norway, and the five new accessions in 1930 were Denmark, Finland, Luxembourg, the Netherlands, and Spain. Denmark, Finland, Luxembourg, and Spain acceded to the whole of the Act. Norway, that had previously given her partial accession to the General Act, extended her accession to the whole of the Act.

The number of States bound by Article 36 of the Statute of the Permanent Court of International Justice rose during 1930 from 19 to 34. The 15 new States were Albania, Australia, Brazil, Canada, Great Britain, India, Ireland, Latvia, Lithuania, Luxembourg, New Zealand, Salvador, Siam, South Africa, and Yugoslavia. Czechoslovakia and Rumania signed the optional clause subject to ratification.

Fifty-two treaties were registered in 1930, 34 in 1929, 15 in 1928 and 6 in 1927. Thirty-one States were parties to the treaties, namely; United States of America, 17; Luxembourg, Czechoslovakia, each 8; Poland, 6; Spain, Hun-

gary, Rumania, each 4; Belgium, Estonia, Greece, the Netherlands, each 4; Italy, Norway, 3; France, Haiti, Iceland, Latvia, Lithuania, Switzerland, Turkey, Yugoslavia, each 2; Afghanistan, Austria, Bulgaria, Denmark, Dominican Republic, Germany, Persia, Portugal, Salvador, Uruguay, each 1. These 52 treaties may be classified as follows:

I. Those relating solely to conciliation procedure (8); II. Those providing for the compulsory settlement of all or certain categories of disputes (44). Of these treaties, 13 provide solely for arbitration or judicial settlement. The 31 others provide for conciliation, arbitration and / or judicial settlement.

In considering these treaties *The Advocate of Peace* pointed out a distinction must be made between the seventeen treaties concluded by the United States and the 35 others. The seven treaties of conciliation concluded by the United States, and the ten on arbitration are all based on the same models. The conciliation treaties present no noteworthy feature and contain no reservations. The arbitration treaties provide for arbitration solely for legal disputes and include four kinds of reservations: (1) Disputes within the domestic jurisdiction of states. (2) Disputes affecting the interests of third powers. (3) Disputes affecting the Monroe Doctrine. (4) Disputes affecting undertakings under the Covenant.

Concerning these treaties, the following points are to be noted: (1) There is a general tendency to provide in the same treaty for conciliation and for arbitration and / or judicial settlement, 31 of the 35 treaties being of this nature. (2) There is a tendency to submit all disputes to arbitration or judicial settlement. Nineteen of 34 treaties are thus drafted. (3) There is a noticeable tendency to eliminate reservations. Twenty of the 35 treaties contain no reservations. (4) As regards legal disputes, the Permanent Court of International Justice is habitually chosen as jurisdiction. Several treaties even give the Court jurisdiction over all disputes.

By Dec. 31, 1930, 182 treaties for the peaceful settlement of disputes had been registered in the League of Nations Secretariat.

A record number of 52 bilateral treaties providing for conciliation, judicial settlement, or arbitration, or for all three combinations, were registered at the Secretariat of the League of Nations during the year 1930. There were only 34 in 1929, 15 in 1928, and 6 in 1927. The number of states bound by the League's general act for the peaceful settlement of all disputes rose during the year from three to eight: Denmark, Finland, Luxembourg, Spain, and Holland being added to Sweden, Belgium, and Norway. The optional clause to accept the jurisdiction of the World Court increased in the same period from 19 to 34, while two more states had signed the clause but had not yet ratified it.

**TACNA-ARICA ARBITRATION.** A careful, well documented account of the *Tacna-Arica* dispute (see YEAR BOOK for 1929) has been written by Prof. William Jefferson Dennis of the University of Iowa and published by the Yale University Press. It relates the facts incident to the origin and details of the long drawn out boundary dispute between Chile and Peru and of attempted arbitrations by the United States. A consideration of this famous boundary dispute was most timely in view of the upheavals and revolutions sweeping over South America. It

came into being through a heritage of indefinite boundaries. Much valued "guano" lay in an area of uncertain control. Soon, Chile, Peru, and Bolivia began struggling for its possession, a contest that resulted in the strange contrasts of the war of 1879 where the sling shots of the sons of the Incas mingled with the best of modern field artillery, and old wooden ships sailed beside nine-inch armored cruisers. War brought no solution and the dispute dragged on for 40 years. Then came the final remarkable settlement by direct negotiation in 1929. The volume is a clear-sighted analysis and an enduring testimony to the need for arbitration in the modern world.

THE "I'M ALONE" CASE. In the development of this case referred to in the YEAR BOOK for 1930, the Canadian Agent, J. E. Read, through his counsel, submitted the Canadian Claim to the commissioners, The Hon. Willis Van Devanter and the Right Honorable Lyman Poore Duff, and George Wharton Pepper the American Agent submitted his answer. These two documents were in the hands of the commissioners who, under the convention, were charged with the duty of dealing with the case. If they should unite in the opinion that under all the surrounding circumstances this was not a suitable case to be made the subject of international controversy, that would end the matter because the decision of both is final. If after considering the pleadings they should call for evidence and argument, the representatives of both governments are prepared to supply them with what they want. If they do not in the first instance "ignore the bill" and if, after testimony and argument, they should be divided in opinion, the ultimate decision of the case will rest with the Standing Claims Commission which, under the convention, is a kind of appellate court.

A special agreement between the United States and Sweden, signed on Dec. 17, 1930, for the arbitration of claims growing out of the alleged detention in ports of the United States of the motorships *Kronprins Gustaf Adolf* and *Pacific*, owned by a Swedish corporation, became effective by exchange of ratifications on Oct. 1, 1931. By a protocol signed on January 20, 1931, an agreement was entered into between the United States and Egypt for the submission to arbitration of the claim of the United States against the government of Egypt arising out of the treatment of George J. Salem, an American citizen, by Egyptian authorities.

The treaty between the United States and Panama, signed on July 28, 1926, for the arbitration of claims by the citizens of each country against the other, became effective on Oct. 3, 1931, by the exchange of ratifications on that day.

GENERAL AND SPECIAL CLAIMS COMMISSIONS (UNITED STATES AND MEXICO). The two-year extension periods covering the presentation of claims to the Special and General Claims Commissions expired on Aug. 17 and 30, 1931, respectively. On those dates the personnel of the Commissions remained the same except that Fred K. Nielsen had succeeded Ernest B. Perry on the Special Claims Commission as commissioner appointed by the United States. It was understood that negotiations with Mexico looking to the conclusion of agreements providing for further extensions of the working periods of the Commissions were in progress at the end of the year.

The only case decided by the Special Claims Commission since 1929 was a claim for the death of Hubert L. Russell at the hands of Orozco forces in the year 1912. By a majority decision the Commission held that Mexico was not liable under the Special Claims Convention for damages resulting from the occurrence.

MIXED CLAIMS COMMISSION (UNITED STATES AND GERMANY). The vacancy in the office of umpire, caused by the death of Roland W. Boyden, who died Oct. 25, 1931, had not been filled up to the end of the year. The other members of the commission were: Chandler P. Anderson, American commissioner; Wilhelm Kiesselbach, German commissioner. The governments were represented before the commission by Robert W. Bonyngue, American agent, and Wilhelm Tannenbergh, German agent (appointed in March, 1931, to succeed Karl von Lewinski, resigned). The principal assistant to the American agent was Harold Hudson Martin. The secretaries of the Commission were Walter R. Dorsey, American Joint Secretary, and Alfred Luders, German Joint Secretary.

The labors of the Commission were approaching completion in 1931. The principal work remaining to be done was in connection with the supplementary petition for rehearing, supported by documents tendered as newly discovered evidence, filed by the American Agent in the two so-called "Sabotage Cases" (Black Tom disaster, fire and explosions at the Jersey City (N. J.) terminal of the Lehigh Valley Railroad Company, July 29-30, 1916; Kingsland disaster, fire at the assembling plant of the agency of Canadian Car and Foundry Company, Limited, at Kingsland, N. J., Jan. 11, 1917), involving some \$41,000,000 (including interest to date), 150 claimants are concerned in these two cases. The claims notified to the commission totaled 20,425: 12,416 under the Agreement of Aug. 10, 1922, in pursuance of which the commission was established, and 8009 (so-called late claims) under the agreement of Dec. 31, 1928. All of these were finally disposed of, except the Sabotage Cases, in which a rehearing was asked, and several others involving demands aggregating only several hundred thousand dollars.

ARBITRATION, LABOR. See LABOR ARBITRATION AND CONCILIATION.

ARCHÆOLOGICAL INSTITUTE OF AMERICA. A society for the promotion of archaeological investigation and research, founded in Boston in 1879 and incorporated by Act of Congress in 1906. It has largely accomplished its purpose through its schools and a number of important committees, including the American School of Classical Studies at Athens, the School of Classical Studies of the American Academy in Rome, the American Schools of Oriental Research in Jerusalem and Bagdad, the School of American Research in Santa Fe, N. M., the American School of Prehistoric Research at Peabody Museum, Yale University, and the Committee on Medieval and Renaissance Studies. In 1931 it had 55 affiliated societies, or chapters, with a membership of 3425.

The thirty-third general meeting of the institute was held at the University of Richmond, Richmond, Va., Dec. 29-31, 1931. In connection with its study of the Mythology of All Races, the institute published *Semitic Mythology*, by Stephen H. Langdon. The official organ is the *American Journal of Archaeology*, a quarterly, while *Art*

and *Archæology*, a non-technical monthly, is published by the institute's Washington society. The officers in 1931 were: President, Ralph Van Deman Magoffin, New York University; first vice president, David M. Robinson, Johns Hopkins University; general secretary, Albert Billheimer, New York University; treasurer, Rollin H. Tanner, New York University; and recorder, Horace W. Wright, Lehigh University.

**ARCHAEOLOGY.** The worldwide depression apparently had little effect upon archaeological investigation. In Egypt especially the archæologist was active. At the Bakaria (ancient Buchum), where were buried the cows that produced the sacred Buchis bulls, excavations brought to light several mummies of these animals. One head was discovered with the gilding completely preserved upon it. In one case the mummy owed its good preservation to the fact that it had been completely coated with wax. In another instance wax had been applied to the skeleton of the cow. The southern end of the Bakaria was found to be mostly of Roman date and here the cows were buried in bricked vaults. In one passage was a stele of the Emperor Commodus.

At el Meadi, near Cairo, on the left bank of the Nile, the Egyptian University uncovered burials which contained much material in the way of stone and flint implements and vases. This points to the existence here of a town antedating the time of Menes and prior to Memphis—which had been regarded as the oldest city in the world. In the layers of debris were found evidence of storerooms containing large storage jars. Except in one instance the dwellings were oval in plan with wooden posts about a half a yard high still in place. Only one dwelling was found to be square in plan. The painted pottery was similar to that found in Upper Egypt. Copper was in abundance.

At Gizeh more than twenty tombs, all showing interesting inscriptions have been examined. Most of them belong to officials of the fifth dynasty. The most important is that of a high official who married a princess who was the daughter of Naosser-Ro, a king of the fifth dynasty. In the tomb were four excellent lifelike alabaster statues. On the wall was incised the king's will contracting for the administration of his estates by his son-in-law. Opposite to the inscription were 15 statues of the witnesses to the will. In the serdab of Wpemnefert's tomb were found five female statues probably of his wife, Meresankh. One stands with the left foot advanced which is an unusual posture for a female statue. Another tomb was that of Nemaatra, chief singer to Pharaoh. Also near the Sphinx was found the sealed tomb of a young woman of the fourth dynasty. The burial was in a chamber at the foot of a shaft 28 feet deep. Here were discovered 78 alabaster vases and under the head of the mummy a perfect alabaster headrest. A curious discovery was that of clay fingers and toes, never before found in Egyptian burials.

At Hermopolis the Germans freed parts of the temple of Seti II. Digging revealed that the precincts were enclosed by a brick wall about 15 meters thick. The University of Michigan excavated a paved way 121 feet long by 23 feet wide at the end of which is a house which may have been connected with the temple on this site, Kom Aushim, in the Fayoum.

The most interesting find was a big granary, built where two streets intersected. The granary

was enclosed by a great wall and contained numerous bins of different sizes and shapes in the floor of a courtyard. Originally the building was two stories in height. Among the many documents discovered here was a papyrus which gives the name of Caius Julius Apollinarius, who may have been in charge of the granary and a collector of taxes for the Roman government. He seems also to have had charge of the rentals of neighboring lands.

At Meydum the University of Pennsylvania Expedition recovered a red granite sarcophagus about seven and a half feet long, the largest sarcophagus yet found in Egypt. It was discovered in a chamber of massive construction. The roof blocks over the doorway weigh around 30 tons. The finds at Meydum date all the way from 3000 B.C. to late Roman times. An interesting bit of work was the clearing of a pit in mastaba No. 8 which had been left unexcavated by Petrie. It was found that the pit went to a depth of 7.40 meters with the lower part cut out of the solid rock. The pit was packed with great limestone blocks. The chamber at the bottom had been robbed through a small hole cut in the roof to which access was afforded by a tunnel from the east side of the mastaba. In the chamber was discovered the name "Ny-Hep, the King's son." He was the son of Snefru. The sides of the mastaba were found to be 38.25 m. by 20.65 m. in length and it had a height of 9 m. On the east face were three niches.

Excavations on the site of the tomb of Queen Neith at Sakkara exposed a funerary chamber with sides almost intact and showing about 800 lines of religious texts. These are the oldest known. The exposed plan of the tomb gives the best known layout of a tomb of the Old Kingdom. It shows a granite floor flanked by two small obelisks bearing the name of the queen, a vestibule, covered with reliefs, storerooms and, near the pyramid, a sanctuary containing an altar stele. There was as well a small subsidiary pyramid for the reception of gifts for the Sun god.

At Tebtunis the Italians discovered remains of an ancient city in which was a great temple sacred to Seknebtuni, the crocodile god. The approach to the temple was flanked by lions and sphinxes with altars and banqueting halls at intervals. In a corner of the sanctuary were found stables, courtyards, ovens, and the houses of officials and craftsmen connected with the temple. In the sacred cemetery to the south of the sanctuary was found the mummy of a crocodile. In the dwellings of the priests were discovered writing tablets, stools, and wooden receptacles for medicines in use two thousand years ago.

At Tel-el-Amarna work during 1931 was concentrated upon clearing the northern suburb. This was found to be a later development and not laid out so carefully. Here rich men seem to have owned large rectangular lots which they sublet to poor tenants who crowded them with small buildings put close together. To the north and south of the town large estates bordered the main roads. Here also was found a large open area which was used as a public dump. When the town grew this space was filled in and built over. In this part was found a beautiful little limestone head of Ankhsefnef, the wife of Tutankhamen.

At Alexandretta, in Syria, was found a splendid Greek palace in good condition. It dates from the fourth century B.C. In one room, which contained

a large bath with pipes leading to it was found a statue of Hercules giving a wand to Hermes. In the middle of the bath is a tall fountain surrounded by columns. Part of the floor of the room is paved with a fine mosaic. The principal mosaic shows Amphitrite reclining and holding a reptile in one hand and grasping an oar in the other.

At Beth Zur, eighteen miles south of Jerusalem, was found a town with finds dating all the way from the bronze age (2200 B.C.) to the Christian era. At Gazah Petrie has discovered neolithic remains and objects which date from the later Hyksos period. Engineers working at Jerusalem have uncovered what is thought to be part of the wall of David. Garstang's excavations at Jericho revealed a system of fortification antedating the year 2000 B.C. Under one building was found a pottery jar of the early bronze age—1000 years before the time of Joshua. At Jerusalem was discovered a tomb bearing in Aramaic the inscription "Jeshua Bar Jehoseff," which should be translated "Jesus, son of Joseph." It is believed that this strange collocation of names is just a coincidence. Lack of chronological and other data connected with the tomb make it impossible to date it with any degree of accuracy.

The third season's work of the Academy of Inscriptions of the Louvre at Ras Shamra resulted in the clearing of an area north of the earlier excavations. It was found that the strata from 60 centimeters to 4 meters was literally packed with votive offerings consisting mostly of intact local fabrics or importations of the fourteenth to the thirteenth century from Crete. Also some fine Rhodian cups were found, together with late Minoan painted vases.

Excavations in the Dead Sea area have proved that Sodom was actually destroyed by fire. Rifts in the ground in the neighborhood suggest that an earthquake may have contributed to the disaster. The oldest stratum found on the site dates about 2200 B.C.

The expedition of the University of Pennsylvania and the British Museum continued its investigation of the temple of Ishtar at Nineveh. The temple had been gutted and had been rebuilt by Ashurnasirpal in the ninth century. Near the temple were found seven interesting tombs built of mud bricks and dating from the third millennium. On the site were also found many tablets whose inscriptions are of the time of Tiglath Pileser. Among the most conspicuous finds was a bronze or copper male head dating as far back as probably 3000 B.C.

At Tellbillah digging had brought to light a group of tombs of the first millennium B.C. In one burial was recovered a fine bronze bowl which had been used for smoking hashish or some other narcotic. In a tomb of the third millennium were found the arms of an Anatolian chieftain together with a cylindrical seal identifying the owner. In all 72 tombs were opened dating from the third millennium for the most part.

The 14 levels uncovered at Tepegawra indicate that this site is the oldest in Mesopotamia. The site is particularly rich in bronzes dating mostly from the third millennium. The evidence discovered points to extensive relations between Asia and Europe at this early date. At Til-Barsib a large palace of Tiglath Pileser III was found with important frescoes still preserved. Those on the walls of the central hall show the king surrounded by his court and giving an audience

and receiving tribute. Another represents a parade of infantry, horse, and chariots. The third shows most realistically a battle.

Important work was accomplished at Ur. The great tombs of the third dynasty kings have been cleared. In February attention was directed to the residential quarter of the city dating from the age of the patriarchs (1900-1200). Some 10 feet above the Abrahamic level were found mud brick dwellings separated from the former by a layer of baked brick walls of about 1400 B.C. Four streets of the town have been now laid bare and they have been found to have been bordered by private houses, shops, and chapels. One large building seems to have been an inn. On the floor of one house were found some 400 complete tablets as well as a thousand fragments. Some of these were legal documents, letters, and religious texts. In another house was discovered a large tablet which gives the complete conjugation of the Sumerian verb together with its Babylonian equivalents. Paradigms for five different groups of stems were given. Not the least interesting of the discoveries was evidence which goes far to show that the book of Daniel was composed at the time of the events described. Thus, the excavators have uncovered the palace of Princess Bel Shalti Nanna, who is believed to have been the sister of Belshazzar. It was their grandfather who took the Jews into captivity in Babylon. This discovery is held to help confirm the Daniel story.

The history of the temple at Ur can now be traced from 2300 to the time of Nebuchadnezzar. At the time of the first date Rim-Sin, who was king of Larsa in the twentieth century, rebuilt the temple. Six hundred years later it underwent another rebuilding at the hands of Kuri-Galzu and about 1000 still another by an unknown Kassite king. The last to touch the building was Nebuchadnezzar who practically made a new temple. A large building, a palace, about a hundred yards square has been excavated. The main court is about 80 yards square. It reminds one of the great palace of Nebuchadnezzar at Babylon. Several chapels of a type hitherto unknown also were discovered. These are little public shrines dedicated to the lesser gods and open to any one for worship.

Not far south of the palace of Knossos in Crete Evans found in a hillside a remarkable temple-tomb of one of the priest kings of Crete. Digging revealed a massive square chamber, the pillar crypt, with inscribed double axes. These pillars had once supported massive beams which belonged to a chamber above. This indicates that here was a small two-columned temple which must have been visible from the south terrace of the palace. This upper structure formed part of a large building located in a long trench which was cut back into the side of the hill. On the lower level one passed through, in this order from the front, a pavilion, a paved court, an inner hall, crypt, and funeral chamber.

At Vournos in Cyprus twenty tombs (dating 3000-2100) were opened. These are cut like caves in the rock and are approached by a dromos. Several using one dromos indicate that we have here a family group. The prevailing custom in the early bronze age was to place the body in the right corner of the chamber with the offerings in the left. These consisted of large jars for food and arms. Some extraordinary forms of pottery were found during examination of these tombs.

On the site of Hephæsteia in Lemnos the Italians have come upon an important Tyrrheno-Pelasgian settlement. Here were found 300 geometric burials consisting of large ovoidal, or biconical, jars laid on the ground and sealed with a slab or a cup.

Professor Robinson of Johns Hopkins University has continued his important work on the site of Olynthus. Many private dwellings were uncovered and about 200 graves. From these finds it was certain that, contrary to what had been previously believed, the Greeks were accustomed to good homes before Alexandrine times. A particularly remarkable find of terra cottas was made yielding over 50 complete figures with the colors still preserved. They have all the character of Phidian and Praxitelean work.

In May, after many delays, the American school was able to initiate the excavation of the agora in Athens. Professor Shear was fortunate enough to locate the Stoa Basileios which makes the orientation of the work possible. This is not far from the so-called Theseum. Immediately below the foundations were found marble and stone chips together with fifth century objects. Below this was a burned layer containing sixth century potsherds. In the earth in front of the steps of the building were later fifth century finds. On the west side of the southern area of the excavation was laid bare in part a building of Hymettus marble which may be the stoa of Zeus Eleutherios, which Pausanias locates near the Royal Stoa.

The Greeks, continuing their work on the site of the Academy, have uncovered the foundations of a very large building which may prove to be the gymnasium. While dredging near the main wharf of the Piræus the Greeks also found fragments of first century reliefs which may have been part of a cargo intended to be shipped to Rome. On the north slope of the Acropolis Professor Broneer believes he has discovered the hitherto lost temple of Eros.

Excavations at Anzio (ancient Antium) in Italy have brought to light parts of a villa of Nero. Traces of luxury, as for example polychrome pavements in mosaic, have been found. A newly found tomb at Chiusi yielded interesting information as to the disposition of such burials. The tomb has three small terminal cells and stands as an intermediate stage between the regular chamber tomb and the later type with niches.

Work progressed steadily at Herculaneum. The first and second insula of the southern section were cleared. In insula three the houses were found to be spacious in plan with architectural features quite distinct from those found at Pompeii. Fine pieces of sculpture were found, for example two fine groups showing a hind being pulled down by hunting dogs. At Lake Nemi the second of the galleys had been completely uncovered and was found to be in exceptionally good condition. It is, however, not so complete as the first. At Pæstum the main effort was directed toward work on the area north of the old road which runs through the city from the Porta Serena to the Porta di Mare. The substructure of the amphitheatre of the Roman town was mostly cleared. The Greek theatre was identified and about one-third of the auditorium cleared.

In Abundance Street in Pompeii a large house was excavated in which, in a niche at the back of the peristyle, a portrait of Menander was

found. The plan and structure of the building is that of the home of a noble Samnite. It had been modified to fit an aristocratic Roman's needs.

In Rome valuable pavements from the Forum of Trajan were discovered. Also there were recovered marble details from the superstructure, especially from the façade.

Between Newport and Caerwent, in Wales, was discovered an ancient British camp. The plan is elliptical in shape, being about 750 feet long by 400 in width. Annexed to it is an oblong area about 500 by 200 feet. Around the camp is a series of ditches. The main camp is connected with the annex by a deep cut. The annex itself is defended in a like manner by a series of ditches. See PHILOLOGY, CLASSICAL.

**ARCHITECTS, THE AMERICAN INSTITUTE OF.** The National organization of the American architectural profession, founded in 1857. Its objects are to organize and unite in fellowship the architects of the United States; to combine their efforts so as to promote the æsthetic, scientific, and practical efficiency of the profession and to make it of ever-increasing service to society; and to spread an understanding of art and service among the people. Its activities include devising methods for improving and extending architectural education, not only in the universities but in the lower schools; securing proper laws for the registration of architects in the various States; developing a service for architects which will give them for their actual problems data relative to building materials and methods obtainable from no other source; and maintaining a public information service to tell the prospective builder the financial as well as the æsthetic, service of the architect.

The institute is governed by officers and a board of directors elected by, and responsible to, the delegates from the 66 chapters, assembled at the annual convention. The directors and executive committee hold quarterly meetings in various parts of the United States, and the regional directors keep in active touch with the work of local chapters throughout the year. The membership in 1931 numbered more than 3400 of the 10,000 practicing architects in the United States.

The sixty-fourth annual convention, held April 14-16, 1931, in San Antonio, Texas, particularly emphasized the desirability of local and Federal governments discontinuing as competitors in business with its private citizens and the desirability of such governments utilizing to the fullest extent every bit of architectural ability that the nation possesses. It stated its belief that standards of excellence can be achieved only by enlisting the services of the best ability in the architectural profession that is locally available and that, therefore, the operation of State, municipal, and other bureaus for the designing of buildings and monuments is inconsistent with this policy and an invasion into the field of individual professional activity.

The officers elected for 1931-32 were: President, Robert D. Kohn of New York City; first vice president, Ernest J. Russell of St. Louis, Mo; second vice president, Horace W. Peaslee of Washington; secretary, Frank C. Baldwin of Washington; treasurer, Edwin Bergstrom of Los Angeles, Calif. The Octagon endowment fund capital of the institute in 1931 amounted to approximately \$78,000, the income being devoted to the maintenance of the Octagon House in Washington. The organization's property and funds to-

taled \$465,227, of which \$53,817 belonged to the Waid Education Fund, the income being used to defray expenses of lecturers sent to various States and to preparatory schools. The institute publishes *The Octagon, a Journal of the American Institute of Architects; Handbook on Architectural Practice; The Significance of the Fine Arts; Standard Contract Forms and Standard Filing System*, which are in widespread use throughout the United States; and documents on the ethics of the profession. Headquarters are in The Octagon, Washington.

**ARCHITECTURE.** The great moot-point of architecture all over the world during the year was no longer traditionalism versus modernism, but rather the question of the domination of the so-called "International Architecture"—the modernism of Le Corbusier, in France, Gropius in Germany, and Howe and Lescaze in America, a modernism of ascetic rectangularity—or of some freer, less functional and more imaginative modern style. The system of past styles was uniformly defunct, save in isolated circumstances, in every Western country, and largely also in Japan and China.

This controversy was carried on with great bitterness and continual propaganda on both sides. Thus *La Cité et Tekné*, of Brussels, published monthly a section "Architecture Internationale," showing photographs of work in the style, from America to Japan—work whose geographical location it would be impossible to fix from the buildings themselves, so alike are they. The most eloquent of the supporters of the opposite view supporting free creation as the basis of design was Frank Lloyd Wright in America, who in his book *Modern Architecture*, and in numerous lectures fought for the right of the architect to design, irrespective of any style. He has beautifully shown how "Modernism" as usually considered, can be the foundation of a stylistic eclecticism as inhibiting and sterile as any stylism of the past.

Whether or not the "International Style" represents a true internationalism of feeling is debatable. Surely recent political happenings give no such promise, and no style can last which is not deeply founded in actual practical and psychological facts. Perhaps the basic cause of the controversy is that industrially and financially internationalism is more and more an existent, if imperfectly realized fact; emotionally, on the other hand, due to tariffs, fear, and the like, nationalism and sectionalism seem growing rather than diminishing. The architectural solution of this dilemma is to be sought not in the profession, but in the actions of statesmen, financiers, and eventually, politicians.

Two great international competitions signalized the year: that for the Columbus Memorial in Santo Domingo, and that for the Folk Theatre at Kharkov, in Russia. The first was judged by a jury of Frank Lloyd Wright, representing North America, Eliel Saarinen, representing Europe, and Acosta y Lara, representing South America. The first prize was awarded to J. L. Gleave of Nottingham, England, the second to Donald Nelson and Edgar Lynch of the United States, the third to J. J. Polacios and L. M. Blanco of Spain, and the fourth and last to T. Lescher, P. Andrieu, O. Zavroni, and M. Gauthier of France.

The winning design is remarkable for being designed as much for effect from the air as from

the land and water. It comprises an enormous cross laid flat on the ground, with the light at the intersection of the arms. In each arm is a deep canyon-like cut, with walls richly decorated, and arrangements for projecting light upward; the dim shadowed recesses of these canyons would be delightful places as a relief from tropic sun. The centre of the cross encloses the memorial chapel. The whole conception is creative, dignified, and impressively simple; it is imaginative and untrammelled by the dictates of any style.

The designs for the Kharkov Theatre, on the other hand, were entirely in the "International" functionalist style favored by the Soviet government; so alike, and with one or two exceptions, so impersonal, that it would be impossible at a glance for the layman to tell one from another. The winning design, by the Brothers Wessenin, of Moscow, was unique in conferring upon the masses of steel and glass windows and plain stucco surfaces a unifying grandeur of mass by the use of a great dome-like roof over the auditorium, and the frank expression of the enormous stage building. Other winners of lesser prizes included A. Kastner of the United States, Walter Gropius of Germany, R. Kawakita of Japan, Bosiger and Storonow of Germany, Kurmann Hirz Lindstrom and Peterson of Sweden, and Norman Bel Geddes, also of the United States.

**THE UNITED STATES—Public Buildings.** The second year of depression hit the building industry with terrific force. Building of all kinds was far below normal; office buildings, commercial work generally, speculative housing, and domestic work all suffered especially. On the other hand, there was a large amount of public building, especially that under Federal auspices; yet even here the amount was pitifully below what was necessary to produce any market effect on the building industry generally.

The most important public building architecturally was that carried on in Washington in the effort to complete the great Mall, and fill the triangle between it and Pennsylvania Avenue. The Department of Commerce Building—one of the largest of the units—by York and Sawyer, was almost completed. It is a huge rectangular mass around several courts, pleasant in color, but utterly undistinguished in detail, and without the monumental character its size would indicate. The fragments already built of the group containing the Post Office Department, by Delano and Aldrich, are on the other hand charmingly delicate, carefully studied though academic. The Department of Agriculture, by Rankin and Kellogg, on the other side of the Mall, resembles the Commerce Building in the uninspired use of classic motives; the one virtue is the harmony between it and other Washington buildings erected some 20 years previously.

Much criticism was caused by the attitude of the Treasury Department because of its failure to employ local architects throughout the country on local work, as well as by the uniformly *hack* character of most of its post offices and Federal building designs. That at Madison, Wisconsin, is typical in its quite stupid parade of outworn motives badly applied. Repeated storms of local protest at published sketches for proposed buildings finally led the Treasury Department to stop publication of preliminary sketches

on the specious-sounding theory that they didn't adequately represent the completed building!

The Treasury Department also claimed that private architects were inefficient and took a long time to prepare satisfactory drawings and specifications. This apparent inefficiency, they neglected to state, was alleged not infrequently to be caused by the requirements under which the private architects worked, by which they were enmeshed inextricably in the department's own red tape methods, and forced to refer for decision to Washington endless petty questions. Each of these decisions might take days to obtain. The whole controversy at the end of the year was much alive, and there was much bitterness on both sides. Its mere existence was evidence that the architectural proceeding of the Federal government needed overhauling.

Of the actual work of the Treasury architects, the post offices at Kansas City and Wichita, Kansas have only size—and possibly, solidity and workability—to recommend them. Architecturally they were without merit. Some of the smaller post offices were better—less ostentatious, more human. Such examples are those at San Bernardino, California, and the colonial buildings at Branford, Conn., and Hanover, N. H.

The State Office Building at Albany, by the State architects Sullivan Jones and William E. Haugaard, in style somewhat resembled the simplified classic of the State Office Building in New York, completed in 1930. A heavily rusticated, rather Roman, lower portion supports a simple range of piers crowned by an adequate cornice—not exciting, it nevertheless has a straightforward character, and a classic note, distinctly pleasant, definitely dignified. The Buffalo City Hall, by Dietel and Wade and Sullivan Jones, is a great simple modernist pile of office building type—it lacks public character and dignity. The Maricopa County Court House and Phoenix City Hall, Phoenix, Arizona, by E. F. Nield, Lescher, and Mahoney, is in a modernized Romanesque that is unconvincing.

Much the finest of the smaller government buildings is the Racine County Court House, Racine, Wis. by Holabird and Root, a stunning mass composition of wings and setbacks, treated with simple straightforward dignity of style. Less ornamental, but most delightful in its handling of masses, and its delicate richness of detail is the Haish Memorial Library, De Kalb, Ill. by White and Weber—a truly distinguished achievement. Other public buildings deserving notice are the New Brunswick War Memorial, New Brunswick, N. J. by A. Merchant, with sculpture by F. L. Mora; the armory at Chicago, Ill. for the 124th Field Artillery, by C. Herrick Hammond, and the magnificent Municipal Stadium of Cleveland, O., by Walker and Weeks.

COMMERCIAL AND INDUSTRIAL. The outstanding commercial building of the year in the United States is without doubt the Empire State Building, by Shreve, Lamb, and Harmon. That it is the world's highest building is purely incidental. The tower portion is superb in its modern use of modern materials, with setbacks of subtle harmony. Its masonry is manifestly a skin, and the vertical leap of its metal strips is thrilling. Giving back the light as they do, reflecting sun or the blue sky, or the rose of morning or evening, they give to the whole a marvelous sense of lightness, of delicate and harmonious strength. But the "Mooring Mast," which is useless for

its supposed function, reflects in indecision of outline its real uselessness; and the base of the whole—the long street and avenue façade—has none of the distinction of the tower portion.

The Irving Trust Company Building at Wall Street and Broadway in New York, by Voorhees, Gmelin, and Walker, is another important skyscraper, attempting to find adequate modern expression for this modern problem. Here the masonry skin is treated in vertical planes that channel the entire building; a similar free use of angular planes is used to break up the surface of the topmost stage. The interiors are over lavish, but effective in their use of mosaic to clothe the walls from floor to ceiling.

The publication of preliminary plans for "Radio City" in New York—the development of almost three entire blocks, from Forty-eighth to Fifty-first Streets, and from Fifth to Sixth Avenue, produced an unprecedented outpouring of popular protest. The public had been led to expect a superb piece of town beautification, carefully thought out. They received only another real-estate promotion, high class, to be sure, but a monument not to city beautification or city pride, but to the hope of profits. The general plan was a real-estate promoters' plan; and however beautiful the detail, it is the general plan that controls effects. The much heralded plaza in the centre turned out to be an insignificant open space completely dwarfed by the 60-story cliff of building at whose feet it is placed. As an answer to protests, the plan was superficially altered, and one square building substituted for one originally oval, and announcement was made that there would be gardens on the roofs! It was still the mammoth real-estate scheme it was at the beginning, thoughtless of the dangers of overcrowding streets, thoughtless of almost everything except square feet for rent. The original architects of the project were announced as Reinhart and Hofmeister; later Corbett, Harrison and MacMurray, and Raymond Hood, Godley, and Foulhoux were added as associated firms.

Various other commercial buildings deserving note are the Ohio Bank Building, Toledo, Ohio, by Mills, Rhines, Bellman and Nordhoff; the McGraw-Hill Building, New York, by Raymond Hood, Godley, and Foulhoux, in which there is an interesting though not entirely successful attempt to stress horizontal rather than vertical lines in a high building; the enormous S. S. Kresge Administration Building, in Detroit, Mich., by Albert Kahn, rather incoherent in its changing rhythms of upper and lower portions; an office building on Fifty-seventh Street and Lexington Avenue, N. Y., by Thompson and Churchill, in which all the outer walls and outer portions of the floors are hung from cantilever girders at the top, so that almost unbroken windows are permitted on each floor; and the New England Telephone & Telegraph Building, Worcester, Mass., by Densmore, Reclear, and Robbins.

The office building erected at No. 29 Broadway, New York, by Sloan and Robertson attempted a modernist expression of banded windows, but achieved only an illogical restlessness. The Fifth Avenue Hudnut Building by E. J. Kahn and Eliel Saarinen, on the other hand, is one of the most charming small buildings on the Avenue; its square panels and square windows are both rich and delicate.

Three novel and important industrial buildings of the year are the Worcester Pressed Steel

Building, Worcester, Mass., by J. D. Leland and Company; the Research Engineering Building for the A. O. Smith Co., Milwaukee, Wis., by Holabird and Root; and the Starrett Lehigh Terminal and Storage Building, New York, by R. and W. Cory and Yasuo Matsui. The Worcester building is all glass and metal on the exterior, with exposed rivet heads used decoratively. The details are classic in inspiration, and hardly harmonize with the modernity of material, but the general affect is light, delicate, strong, and new. The A. O. Smith building is likewise metal and glass on the exterior, but entirely modern in style. Its front is divided into vertical bays of slight projection to catch the maximum of light, and create a sense of lateral strength; the whole is light, crystal-like, and lively. The Starrett Lehigh Building has two beautiful wings of cantilevered construction, with horizontally banded continuous windows, and rounded corners, and a less successful and more labored central mass with masonry expression. All these buildings are prophetic in their creation of new kinds of beauty directly dependant on new materials.

**EDUCATIONAL BUILDINGS.** The loveliest of the year's educational buildings was the Adler Planetarium, Chicago, by E. A. Grunsfeld. Its setback proportions, its dome outline, and its details, are beautifully simple and right. College buildings were generally conservative in style. The Sterling Memorial Library at Yale, by James Gamble Rogers, is as lavish as Harkness Quadrangle. Full of picturesque details, it nevertheless brings up the whole question of the propriety of such extravagant borrowing from the past, such building of atmospheric bits instead of buildings, or why the catalogue room of a modern library should look like an English perpendicular chapel. The students themselves seem moved more by the anachronism than the gorgeousness.

The severe and monumental Georgian of Dunster House and Lowell House, the new "Colleges" of Harvard University by Coolidge, Shepley, Bulfinch, and Abbott, have a greater soundness of design; they seem real. The Radcliffe Lecture Hall at Harvard, by Perry, Shaw, and Helburn, is a scholarly work based on Bulfinch's Harvard works.

Among the other college buildings, the new work at Duke University, Durham, N. C., by Horace Trumbauer; Brothers College at Drew University, Madison, N. J., by Henry B. Marsh; and the Men's Dormitory of St. Lawrence University, Canton, N. Y., by Ernest Sibley and Lawrence C. Licht, are all in colonial or Georgian styles. The last is especially effective in its grouping. Western Theological Seminary, Evanston, Ill., by Armstrong, Furst, and Tilton; and the Clothier Memorial at Swarthmore College, by Karcher and Smith are in collegiate Gothic; the former is distinguished more by its pleasant plan than its commonplace detail; the later by a beautiful, simple tower.

School designs of the year were generally undistinguished. The styles are often a mechanized collegiate Gothic—without the honesty of straightforward modernism or the charm of the Gothic—or else some interpretation of colonial prototypes, generally more successful because simpler, as in the Elementary School, Norwood, Mass., by McLaughlin and Burr, or the Beaver Country Day School, Brookline, Mass., by G. Allen. The Junior High School, Lynwood,

Calif., by Marsh, Smith, and Powell, rises above the general level because of its powerful modern mass composition, and the Linscott Primary School, Watsonville, Calif., by W. H. Weeks, because of its quiet one-storied charm.

**ECCLESIASTICAL BUILDINGS.** The gradual and inevitable freeing of church design from archæological dictation can be well seen in several examples—St. Madeleine Sophie's Parish School and Chapel, Germantown, Pa., by Henry D. Dagit and Sons; St. Joseph's Church, Seattle, Washington, by A. H. Albertson, Wilson, and Richardson; the Charity Crucifixion Tower, Royal Oak, Mich., by H. J. McGill, T. F. Hamlin collaborating; St. Catherine of Sienna, New York City, by W. Anthony; and two Swedish churches, the First Baptist, New York, and the First Lutheran of Arlington, N. J., both by Martin Hedwark. The first, basically Gothic, uses great modern concrete parabolic arches to support the chapel roof. St. Joseph's in Seattle is a simple modern interpretation of concrete construction. The Charity Tower lifts bold sculptural masses above a simple terrace, and bears a monumental stone crucified Christ figure. The two Swedish churches embody much of the free loveliness of modern Swedish craftsmanship and design, though the useless high stepped gable of the New York example has no functional reason. St. Catherine of Sienna, New York, is perhaps the most finished, the most carefully organized of all the churches, brilliantly conceived, and carefully carried out.

The most interesting of the more conservative churches are all in a colonial or Georgian style, that seems so beautifully adapted to the American landscape and to congregational service. The best examples are: the Mission Church of St. Giles, Stonehurst, Pa., by Wilson Eyre and McIlvain; the First Presbyterian, Hackensack, N. J., by E. P. Mellon and W. L. Smith; and the Fourth Church of Christ Scientist, of Milwaukee, Wis., by C. D. Faulkner and C. W. Wands, with a beautifully slim spire and an interesting plan.

**HOTELS, HOUSING, DOMESTIC WORK, ETC.** The completion of the New Waldorf Astoria Hotel in New York, by Schultz and Weaver, revealed a great mass with two metal-topped towers, and with large and lavish interiors of many styles; all rich and rather incoherent. The best portions are the central office space, with its entrance, the set room, with interesting murals, and an English late Georgian room; the worst is the large and ineffective Ball Room. The Atlantic Beach Club, Atlantic Beach, Long Island, by Joseph Urban, is exceedingly ingenious in plan, but ineffective in mass; the Nikabob Club, Los Angeles, Calif., by Morgan, Wells, and Clements, has some beautiful interiors. The Los Angeles County General Hospital, by the Allied Architects of Los Angeles, has simple mass and adequate detail, and the Illinois Soldiers' Orphans' Home, Normal, Ill., by C. Herrick Hammond, is a charming group of small cottages delightfully simple and direct.

Good apartment houses of conservative type were built at Radburn, N. J., by Clarence Stein and Andrew Thomas; this development by the City and Suburban Homes Co. of New York was justifying its carefully thought out and interesting town plan by a well deserved success. The most interesting of the year's apartment houses was Baxter Apartments, Los Angeles, Calif., by

G. J. Adams, where a purely modern expression of a carefully arranged plan has created great human loveliness and beauty. Other housing work meriting notice is the Forest Hills Development, Cleveland, O., by Andrew Thomas, with small houses of charming informality; the model Shopping Village at Highland Park, Dallas, Tex., by Foshee and Check—a group of Spanish tiled roof shop buildings beautifully related; and the simple Georgian faculty houses for Swarthmore College, by W. Pope Barney. Among city apartments, that occupying a block on First Avenue and 57th Street, New York, by Roger Bullard, Philip Goodwin, and Kenneth Franzheim is interesting in its fresh and daring modern use of corner windows and black and white brick.

Another important example of the bold and successful use of black in design is the Earl Carroll Theatre, New York, Ernest Keister, architect, and Babolney, designer. Here a large interior, mainly in black, is beautifully patterned with silver bands and silver hollows which form the light source. The whole is relieved with delicate touches of vermilion and orange. Altogether, it is the most unified and interesting of any of the recent American theatres.

The influx of modern types of design into domestic work is increasing. Although the lovely Jopling House, Southampton, L. I., by Rodgers and Poor, with its hipped roof and delicate detail, is conservative in style, modern influence is obvious in the schooled simplicity of detail. The Tyng House, also at Southampton, by Peabody, Wilson, and Brown, is completely modern in exterior dress, but the modernism somehow seems a cloak over a purely conservative building. Two most interesting California houses show the complete dominance of the modern approach, in plan and structure as well as in style. The Wolfe house in Catalina Island, by R. M. Schindler, steps up on a steep slope in a most interesting and practical way; the Cedric Gibbons house at Santa Monica, designed by Cedric Gibbons and Douglas Honnold, is full of the most interesting rectangular forms, and uses plain surfaces relieved by grouped windows and free and delicate detail most effectively. It is, like the Baxter Apartments, as human and as lovable as it is modern, and shows perfectly the possibilities of this type of design.

ENGLAND. The amount of building in England was great, despite the depression, and its general standard high. Modern trends seemed to have been quietly absorbed, and simply, directly, and beautifully expressed, in a surprising kind of quiet flowering. Many competitions were held, of which the most important were that for the Public Offices of Leicester, won by H. S. Silcock, Greyson and Barnish with a handsome Italianate scheme; the Municipal Bank of Birmingham, won by T. C. Howitt, with a scheme of simple rectangles; the Wesleyan Methodist Church group at Friern Barnet, won by Farrow, Turner, and Cooper, with a brilliant and monumental plan; the Branch Baths of Folkehill, Coventry, won by Adshead, Topham, and Adshead, with a scheme having a delightfully simple elevation; and the Public Baths, Police and Fire Stations of Northampton, won by J. C. Prestwich & Sons with a design somewhat in the spirit of George Dance.

The year's public buildings were predominantly those of social usefulness—baths, libraries, and

the like. An addition to Ealing town hall, by the late G. H. Pryune, and A. W. Johnson, has a stately Jacobean towered entrance, and a great vaulted hall. The Bognor Council Offices, at Bognor, Sussex, by C. Cowles-Voysey, is in a much simplified Georgian with a good cupola. The Baths include the South Bristol Baths, Bristol, by C. F. W. Dening, a well composed group; the Finsbury Public Baths and Wash-house, London, by A. and K. Cross, a simple two storied building with hipped roof, and the ornate Georgian Bethnal Green Public Baths, London, by A. E. Darby Mice-Aimf. The New Market Hall of Southport, by H. Langman, is a simple block with three great entrance arches. Hendon Central Library, Hendon, by T. M. Wilson, is a massive Georgian building with an over-crowded front; the Clacton Town Hall and Public Library, by Sir B. Thomas, is simpler in treatment, and more modern in effect.

Characteristic of present conditions are numbers of Government Employment Exchanges, all by the architect of H. M. Office of Works. Typical examples are those at Cradley Heath, Bilston, and Stourbridge. The Hastings Railroad Station by J. R. Scott, with its classic brick and stone treatment, is much like American examples of fifteen years ago.

The commercial buildings as a class were more modern. Certain large London structures keep the older classic dress, but use the classic motives with a new dignity and restraint, and were rapidly creating a new commercial London of superb monumental type. The great Finsbury Square building by Sir Giles Gilbert Scott and R. G. Wills is typical; Unilever House, by Sir John Burnett, Taft, and Lorne, has an impressive curved front something like Lloyd's Bank, by Sir John Burnett and partners, finished in 1930. The additions to the Bank of England, by Sir Herbert Baker, are fronted with a three storied classic treatment which is certainly not a beautification of Soane's original lovely one storied façade; but the very beauty of that made the problem extremely difficult, and enough of Soane's exquisite neo-classic work of a hundred years ago remains to give still the dominant character.

Broadcasting House, London, by G. Val Myer, is an interesting departure from this classic trend, while retaining monumental character, and not being obviously "Modernistic." Somewhat similar in style is Kelvin House, London, by Constantine and Vernon. Straightforward interesting modern character distinguishes the Spicer Building, London, by F. W. Troup, and the even more successful and modern Avon India Rubber Co. Building, London, by Wallis, Gilbert, and partners, a most interesting handling of horizontal bands tied together by a heavy corner. Crawford's shop, London, by F. Etchells and A. Welch, has lovely metal elements freely treated, and the Oxford Street Shop of Lennad, by H. A. Wright, is a most successful example of the extremely modern "Cubist" treatment. A shop building at Coventry, by Percy Bartlett, is successful with horizontal lines, and the simple Coöperative Store Building at Bolton, by Gass and Hope, is exceedingly charming.

Among industrial Buildings, the Aladdin Factory by Nicholas and Dixon-Spain; the factory for the Jantzen Knitting Mills, by Constantine and Vernon and R. Sunderleaf; and

the well massed Indian Tyre and Rubber Co., by Wallis Gilbert and partners, all stand out.

The year's theatres vary from the unmitigated Hollywood pseudo-everything of the Granada Theatre at Tooting, by C. Massey, to the interesting modernism of the Gaumont Palace, Birmingham, by W. R. Benslyn, and the original Sheen Cinema, London, by Leathart and Granger and to the careful and lavish delicacy of the Saville Theatre, London, by T. P. Bennett, with a sculptured frieze by Gilbert Bayes.

Of the many interesting school buildings, the following deserve especial notice: Grignon Hall, Felstead School, by Chetwood and Grant, a Georgian building with good mass; the Whitgift Grammar School, South Croydon, by Leathart and Granger, in modernized Tudor; the radical "School in the Woods" (an open air school) at Whaley Thorns, Derbyshire by G. H. Widows; the stunningly planned Elementary School at Birkdale, Southport, by Grayson and Barnish; the Boys' Secondary School, Stretford, Lancashire, by S. Wilkinson, in an attractive combination of brick and stone, and the Warrington Training College, Liverpool, by Slater and Moberly. What characterizes all of these is adequate space, and a strong combination of monumental plan, and simple but attractive exterior and interior detail.

English churches were almost without exception modern in design, were distinguished, and by a combined simplicity, interesting mass, and a slight flavor of tradition well wedded to the present day. Archaeological design in churches is dead—St. Paul's R. C. church, Hayward's Heath, by W. C. Mangan, was characteristic in its interesting exterior bays and interior arches; and the chapel at Kelham Theological College, Newark, by Currey and Thompson, in its low dome and interesting arched brick rood support. Other typical examples were the Bromsgrove School Chapel, by Sir G. G. Scott; and St. Mary's, Pype-Hayes, Birmingham, by Wood, Kendrick, and Reynolds.

Much apartment and community housing was built during the year in which the English talent in using simple materials directly is obvious. Even in the lavish Dorchester Hotel, Park Lane, London, by W. Curtis Green and partners, done in a much simplified and modernized Adam style, there is a lovely and typically English simplicity of light stone and delicate iron balconies, and in most of the London apartments big and little, brick and balconies and grouping are the foundations of the effect. Thus in Swan Court, by Buckland and Haywood, pleasant mass and quiet brick give beauty; in the flats for Kensington Housing Trust, by T. Smith Shearer and S. C. Kirby, a more modern effect is gained with equal simplicity and in Broxholme House, Fulham, by G. Topham Forrest, the same directness distinguishes a new municipal tenement.

Other housing and domestic work deserving notice comprises: A model tenement for the Finsbury Borough Council, by E. C. P. Monson; a terrace of five delightful modernized Georgian houses in Ealing, by W. S. Grice; the modernist minimum price house at Knockley, by F. E. Towndrow; and the beautifully planned and well detailed Kirkby House, Overblow, Yorkshire, by John C. Proctor, which in spirit resembles some of the work of the German, Mendelsohn.

THE COLONIES AND FOREIGN ENGLISH WORK. The Bengal Legislative Council House, India,

by John Greaves, is a monumental building of powerful scale with a central dome and a great Doric colonnade, somewhat incongruous in its surroundings, but well done. The Commander-in-Chief's house in New Delhi, by R. T. Russel, harmonizes adequately with the rest of the great capitol group. The church of St. Paul, Wad Medani, Egypt, by Martin and Davies, is romantic, with rough stone walls, and brick quoins, but has little to do with its environment. In the Galle Face Flats, Colombo, Ceylon, Edwards, Reid, and Booth have produced a whole that is a strange mixture of classic and Mohammedan motives. The most successful foreign English work was probably the Government House in Jerusalem, by A. St. B. Harrison, a superb mass with impressive interiors, that seems entirely to belong to its location in mass, material, and style.

FRANCE. The outstanding event in French architecture was the Colonial Exposition; on the whole, a most satisfactory group of temporary buildings, neither ostentatiously eccentric nor hidebound. Much of the loveliest work was of course the reconstruction of various colonial types of building—especially among many others, Angkor Wat, by M. Blanche; the building of Cochinchina and Tonkin, by Blanche and Sabrier; that of the États de Lévant, by M. Moussali; the Ile de Rhodes, by M. Lombarde; and that of the Kameroun and Togo, by M. Boileau. Of the other buildings, the Cité des Informations, by Chevalier and Bourgon was delightful with its long court and a superb central dome and Salle des Fêtes. The permanent museum, by Laprade and Jausely, has an interesting colonnade with a sculptured wall behind. The American pavilion—a reproduction of Mt. Vernon—by Gréber and C. K. Bryant was disappointingly out of place in such an imaginative and fantastic group. The Dutch buildings, by Mooyen and Zweedick, were interesting. See EXPOSITIONS.

Among other French work, the following deserves notice: The casino at Dax, by A. Granet, with lovely outdoor and indoor theatres, quite modern; the simple and beautifully proportioned Ford Building in Paris, by M. Roux-Spitz, with curved corner; Sacré Cœur Church at Casablanca, and St. Joseph de l'Océan at Rabat, by P. Tournon, both structurally interesting; the church of St. Laurent at Rosny sous Bois, by M. Chauvel, simple and lovely, and St. Louis at Rouvray-Mines, by Duval and Gonse, with a heavy and impressive interior. The Paris Apartment House at Porte Chamberet, by P. Patout, is beautifully massed with vertical bays and strong horizontals. The Theatre of the Menus-Plaisirs, Paris, by M. Pingusson, is a *chic* example of fantastic extreme modernism; and the Villa at Garches, by G. Veissière is charming in its simple modern design and its brilliant use of various terrace levels.

GERMANY. The German Building Exposition in Berlin, held in an interesting and simple group of halls and sheds designed by Wagner and Poelzig, showed the almost complete domination of German architecture by the functionalist "International Style" extremists. The effect upon German housing has been disastrous, for many recent developments, by E. May, Block and Guggenheimer, Gropius, and others, have degenerated into long straight rows of characterless building, at exactly the mathematical angle to catch the most sun and air, but, as houses, utterly inhuman and unattractive. By contrast

the freer, less theoretical groups, however modern in detail, seem all the more successful—a. g. groups at Halberstadt, by F. Keller; at Braunschweig, by Flesche and Kölling; and apartment developments at Berlin Wilmersdorf, by H. Rosenthal, and for the Beamten Wohnungs Verein at Neu Köln, by B. Schneiderreit.

The Neu Wache War Memorial in Berlin—a great black marble cube with a bronze wreath in the centre of Schinkel's building—by H. Tessenow, is dignified and impressive, and the War Memorial at Jena, by Högg and Müller—an altar surrounded by a circular wall—is worthy of praise. German churches, as usual, were on an extremely high plane of dignity, imagination, and modernity. Excellent examples are the Evangelical Church, Berlin-Wilmersdorf, by F. Höger; the Catholic Church at Maria Grün, by C. Holzmeister; and St. Engelbert, Pattscheid, by B. Rotterdam.

Several large commercial and industrial buildings and groups are important in revealing that sense of organization which again and again makes German factories architectural units, and also a growing freedom in the imaginative use of the Mendelsohn type of geometrical forms. The Graf Zeppelin Hotel and Café, Bonatz and Scholer, Stuttgart, is a rather bleak exterior to decorate the Station Square, but has beautiful open interiors and good detail. The Rubber Factory for M. Steinberg, at Köln-Braunsfeld, by F. Fuss, has unusually interesting forms, and the Kalksteinwerk at Garbsen in Hanover, by Dr. Thiele, is really beautiful. The Gesellschaftshaus of the Garden City at Nürnberg by Leubert and Lehr is a charming development of local forms; and the Airport and Airport Restaurant in Halle, by H. Wittwer, equally delightful in a thoroughly constructivist modern manner. The Arts Club in Hamburg by K. Schneider is worthy of notice for its simple treatment and handsome interiors. Mendelsohn's own Columbus House, Berlin, is interesting, as is the Mendelsohnian Warehouse for Kops, in Cologne, by Riphahn and Grod. Characteristic and beautiful examples of the Hamburg School of simple brickwork are the Administration Building of the Rhenania Ossag, Hamburg, by Skopp and Vogtmann, and the Industrie and Handelskammer in Dortmund, by Pinno and Grund.

OTHER COUNTRIES. The depression seemed to have caused a marked falling off in the quantity of building in the Scandinavian countries. In Norway the most interesting published work was the new Oslo City Hall, by Arneberg and Poulsen, an imposing group of monumental plan. The New Theatre, Oslo, by Blakstad and Dunker, is simple and rather German in type, and the Fine Arts Club, Oslo, by Blakstad and Munthe-Kaas, is a freely experimental work. In Sweden, important work comprises the interesting Malmö Apartments, by F. Österkind; the Mendelsohn-like business building in Borlänge, by Sundahl and Rockstrom; the ingenious but ugly Filadelfia Church in Stockholm by B. Jansson, with large seating capacity, more like a theatre than a church; the classic Geological and Mineralogical Institute of Lund University, by T. Möller; and domestic work by Fant, Hörvik, Hjorth, and Markelins.

The outstanding work in Denmark was the stunning group of the State Radio and the Royal Theatre in Copenhagen by N. Carlsberg, in the typical Scandinavian modernized classic, lavishly

rich and beautifully detailed throughout, on a beautiful plan. The School at Burnan, on the other hand, by H. Meyer, has the characteristic "International" bleakness and lack of interest. The Solgaarden Apartments, Copenhagen, by H. Hansen, are attractively grouped around a large court. Finland built many interesting structures in its usual robust modern rather classic manner; the completion of the Capitol, by J. S. Siren, revealed a grand plan, magnificent interiors, and great scale and simplicity. Other typical examples comprise St. Paul's Church, Valigård, by B. Liljequist; the Torni Hotel, 13 stories high, by Jung and Jung; a High School at Helsingfors, by O. Kallio; and the classic Helsingfors Swimming Baths, by V. Vähäkallio.

The most important Austrian building was the great Viennese Stadium by O. E. Schweizer; the Himmelreich House, in Brunn, Czechoslovakia, by Hofmann and Augenfeld, has lovely Viennese delicacy. In Czechoslovakia, the dominance of the international school was seen in the Students' Building in Brunn, by B. Fuchs, the Catholic Church in Ursovice, Prague, by J. Gőcár, and the Children's Home and Kindergarten at Konigsgratz by J. Gőcár. The same tendency was shown in Poland, in the Warsaw apartments by J. Stefanowicz, and villas by Łachert and Szanójca. The Hungarian work was characterized by tremendous vitality, and an evident struggle between the "International" type, and a kind of robust modern classic not unlike that of Finland. The New Swimming Bath, St. Margaret's Island, Budapest, by A. Hajos; and the church by A. Arkay, at Győr-Gyarnarosi, both illustrate the latter tendency; the bad Le Corbusier of the Villa Delaj, by S. Pal and M. Farkas, illustrates the former.

The best of the larger Swiss buildings of the year were the General Post Office at Zurich, by Sihl, the Schmidhof, Zurich, by K. Knell, the Zurich Borse, by Henauer and Witschi, and the Bern High School by Salvisberg and Brechbuhl. The extraordinary Goetheanum at Dornach, by H. Ranzemberger—a large theatre building—also deserves notice if only for being a terrific example of the results of purely theoretic architecture—"anthroposophische" architecture it is called,—and its main tenet seems the rigorous avoidance of any right angles or symmetry of any kind, vertical or horizontal. A whole tortured fantastic community has been built in the style by R. Steiner and Ranzemberger since 1920. Other Swiss work of merit includes the great housing development of Neubühl, Zurich-Wollishofen, by Artaria and Schmidt, Haefeli, Hubacher and Steiger, and Moser and Roth—a community of modern single houses and apartments, simple and charmingly arranged.

The Dutch continued to use the superficially picturesque type of modern detail at which they are so skillful, developed a few years ago in much Rotterdam and Amsterdam housing. Exceedingly clever especially in its use of brick, it lacks the soundness of arrangement of the Mendelsohn work in Germany, and also the functionalist logic of the Le Corbusier "International" style. The most interesting examples were the Hotel Atlanta, Rotterdam, F. A. Vander Togt; the Amstel Brewery, Amsterdam, G. and A. Langhout; the interesting and lovely City Hall at Hilversum, by Dudok, and the Laboratory for the Batavia Petroleum Company, Amsterdam, by C. Abspoel. Dutch churches are usually over ro-

mantic, and tricky in design, and conservative in scheme though modern in detail. The best examples were the Reformed Church at Scheveningen, by W. C. Kuipers; the church at Eindhoven, by F. B. Jantzen; and the Reformed Church at Hengelo, by E. J. Rothnizen.

In Belgium, the "International" style was well represented by the Casino at Knocke, by Von Hoerlacker, Dens, and Stylen, with interesting curved glass end bays—a striking and effective composition;—and by the Airport at Antwerp by S. Jasinski, with interesting banded windows. The freer type of modernism was expressed in attractive houses at Brussels, by G. Hendricx; and at Luttich, by deKoninck and Nyst.

In Italy the most interesting work published was the design for the Lido Hotel at Ascona, by O. Zollinger, the designer of much other beautiful work at Ascona—a daring curved plan with effective curved glass bays, radical but convincing. The Villa Los Olivos, Valencia, Spain, by A. G. Davo, with its crude baroque detail seems an anticlimax and retrogression.

The best Canadian work included The Canada Life Assurance Co. building at Toronto, by Sproat and Rolph, with beautiful mass; the simple and attractive Architect's Building, Montreal, by Ross and Macdonald; and Whitner Hall, a Woman's Dormitory for the University of Toronto, by Mathers and Holdenby, a simple piece of pleasantly effective colonial work. In general, Canadian work was almost identical with that of the United States, though still somewhat more conservative. The most radical departure, and one lavish and effective, was in the interiors of the shop of T. Eaton and Co., Montreal, by J. Carlu, with murals by Natacha Carlu.

South American work was still chaotic in ideals—French, Spanish, American, Modernist, Baroque trends all pulling in different ways. Thus the City Hotel, Buenos Aires, by Madero, was merely a mediocre New York Gothic skyscraper; The Apartment House in the same city, by Calvo, Jacobs, and Gimenez, a charming restrained expression of the French classic ideals of 1890; the Ford Agency in Cordoba, by A. Lo Celso, a fine piece of superficial modernism, and the municipal housing called "Los Andes," by F. Bereterbide, a lavish "Spanish" group. The Dupont Building, Buenos Aires, by A. Christophersen, was more organized, with good rectangular massing; and the Banco Popular Argentina, by A. Y. C. Vilor was an extremely effective and lavish piece of Spanish Renaissance with a high Giralda-like tower. Of the smaller work, the Residencia Veraniega, Mar del Plata, by A. Gutierrez y Urguito, had beautiful simplicity, and the Villa La Cascada, in Aurumalan, by A. Bastillo, was charming in an atmospheric manner. An important piece of city planning was the removal of Monte Castello, at Rio de Janeiro, thus connecting separated parts of the town, and creating a new quarter. It was planned by A. Agache of Paris.

The chief event of the Far East was the planning and beginning of the great new governmental centre of Shanghai, of which Dr. Sheng Yi was engineer, and Dayu Doon architect. The scheme is in the Chinese style, magnificently planned with lagoon, bridge, monumental gate and pagoda, and the great Chinese City Government Building of Greater Shanghai, by Dayu Doon, was well under way. A great beginning also

was made on the government reconstruction of Nanking, under government architects. Of European work, the most interesting was all distinctly modernist in style, and comprised the Shanghai Jewish School, and the Ritz Theatre, both by C. H. Gonda; the Shanghai Commercial and Savings Bank, by F. E. Milne, and the Chinese Housing for the Morris Estate, by Lester, Johnson, and Morris. Good more conservative work included the Rivers Court Apartments, Shanghai, eight stories high, and with all improvements, and the Lieu On Kee Office Building, Shanghai, both by Eliot Hazzard. See BUILDING; and PHILOLOGY, MODERN, for bibliography.

**ARCTIC EXPLORATION.** See ANTHROPOLOGY, POLAR RESEARCH.

**ARGENTINA.** A federal republic occupying, with Chile, the southern third of South America; consisting of 14 Provinces, 10 territories, and the federal district. Capital, Buenos Aires.

**AREA AND POPULATION.** With an area of 1,153,119 square miles, Argentina had an estimated population on Jan. 1, 1930, of 11,470,908, compared with 7,885,237 at the census of 1914. With the exception of about 30,000 Indians, the inhabitants are of European antecedents. Over 30 per cent of the Argentinians live in 10 cities, Buenos Aires alone having an estimated total of 2,116,284 on Jan. 31, 1930, or 43,595 more than on the same date in 1929. Other leading cities are Rosario, with 500,000 inhabitants (estimated) in 1930; Córdoba, 239,000 on Jan. 1, 1930; La Plata, 165,813 in May, 1928; Tucumán, 91,216; Santa Fé, 105,000 in 1929; Mendoza, 58,790; Bahía Blanca, 44,143. The population of the Province of Buenos Aires, which receives the bulk of immigration, was 4,092,042 on Jan. 1, 1930, or almost double the total at the 1914 census. Births in 1929 totaled 312,621; deaths, 141,657; marriages, 79,738; immigrants, 140,086; emigrants, 58,365. Immigration, which consists mainly of Spaniards, Italians, and Slavs, showed a marked decline in 1931.

**EDUCATION.** Free and secular education is compulsory for children between the ages of 6 and 14. In 1929, there were 11,280 primary schools, with 1,381,604 pupils enrolled; 239 secondary, normal, and special schools, with 52,780 pupils; and 85 practice schools, with 30,407 pupils. In 1930, the 5096 national schools under the jurisdiction of the National Council of Education, enrolled 595,059 pupils. Private schools (1929) numbered 126, with 11,632 pupils. There are national universities at Buenos Aires (12,532 students in 1930), Córdoba (2500 in 1929), La Plata (3000), Tucumán (600), Rosario (4000), and provincial universities at Santa Fé, Cuyo, San Juan, and San Luis.

**PRODUCTION.** Argentina ranks among the first five nations of the world in agriculture and stock raising, the products of which are for the most part exported. Due to the lack of adequate mineral, fuel, and water power resources there is no basis for extensive industrial development. Manufacturing is confined principally to the preparation of foodstuffs. The area of land under crops and cultivated grasses totaled 62,479,000 acres, or 9 per cent of the total area, in 1928-29. It is estimated that nearly 30 per cent of the entire country is suitable for cultivation, but the system of land tenure, under which some 17,000,000 acres of farm land are held in estates of 25,000 acres or over, prevents the proper utili-

zation of the soil. The area devoted to orchards, vineyards, and yerba maté (1928-29) amounted to 2,600,000 acres; pasture land, 304,000,000 acres; forest, 186,000,000 acres.

Crop yields for the harvesting season ended in February, 1931, with comparative figures for 1929-30 in parentheses, were: Wheat, 238,830,000 bushels (162,575,000); rye, 4,724,000 bushels (4,401,000); barley, 14,238,000 bushels (16,132,000); oats, 49,604,000 bushels (68,294,000); corn, 371,054,000 bushels (249,160,000); linseed, 68,895,000 bushels (50,005,000); cane sugar, 382,000 metric tons (340,000). The cotton crop in 1929-30 totaled 71,700,000 pounds; potatoes, 32,283,000 bushels; wine, 218,229,000 gallons.

Argentina ranks third among the nations of the world in the production of sheep and fourth in the number of cattle. Livestock at the census of July 1, 1930, with 1914 census figures in parentheses, included: Cattle, 32,211,855 (25,866,763); sheep, 44,413,221 (43,225,452); horses, 9,858,111 (8,323,815); swine, 3,768,738 (2,900,585). There were also (1930) 5,647,396 goats, 1,039,420 mules and asses, and 37,428,427 poultry. Meat refrigeration is the leading industry. There were exported (1930) 529,500 metric tons of frozen and chilled meats, compared with 565,100 tons in 1929, and 109,400 metric tons of frozen meat sundries (122,800 tons in 1929). Flour mills have an annual average output of about 7,000,000 sacks. The dairy, quebracho extract, and textile industries have expanded, the latter under high tariff protection. The net value of manufactured products (1927) was \$500,000,000. The state-owned oil fields in 1930 produced 5,206,918 barrels and private fields 3,701,874 barrels. Mining is of limited importance, the principal metals worked being gold, silver, copper, and tin. Tungsten, coal, borate, salt, and limestone are also found.

Poor crops and low prices received for farm and livestock products in 1930 seriously affected the national economy. Large gold exports were followed by the abandonment of the gold standard and Argentine exchange depreciated in value about 29 per cent. The weakness of exchange added seriously to the burden of servicing the foreign debt and severely affected the profits of foreign companies operating in Argentina.

COMMERCE. The total foreign trade of Argentina declined more than 25 per cent in 1930, as compared with 1929, imports falling off 14 per cent and exports over 35 per cent. Imports amounted to 739,183,000 gold pesos (861,997,000 gold pesos in 1929) and exports were 614,104,000 gold pesos (953,744,000). The gold peso exchanged at an average of \$0.8351 in 1930. The above figures do not include gold shipments, imports of which in 1930 were 51,820 gold pesos (11,296 in 1929) and exports 25,165,174 gold pesos (174,397,522 in 1929). Of the 1930 exports, about 262,136,000 gold pesos, or 42.8 per cent of the total, represented pastoral products and 322,978,000 pesos, or 52.7 per cent, agricultural products. The period from 1926 to 1929 was marked by a steady growth in the value of agricultural exports and a comparative falling off in the value of pastoral exports. The volume of exports, however, remained relatively stable until 1930, when it declined sharply.

Leading imports, in order of value in 1930, were fuel oils and lubricants, textiles and textile products, machinery and vehicles, iron and iron products, foodstuffs, and chemical products. Im-

ports came principally from the United States, which supplied 21.6 per cent of the 1930 total (26.9 per cent in 1929); Great Britain, 21 per cent (18.6 per cent); Germany, 12.2 per cent (12.2); and Italy, 7.8 (7.1). The United Kingdom took 30.1 per cent of the total exports in 1930 (32.2 in 1929); Belgium, 11 per cent (10.7); Germany, 12.6 (10); the United States, 9.3 (9.8). The decline in the value of imports from the United States in 1930 was traceable to the smaller demand for automobiles. For the year ended Dec. 31, 1931, United States figures showed exports to Argentina of \$52,600,000 (\$129,900,000 in the previous 12 months) and imports from Argentina of \$36,000,000 (\$71,900,000).

FINANCE. Budget estimates of the Irigoyen Government placed 1930 receipts and expenditures at 733,144,300 paper pesos and 732,744,000 paper pesos, respectively. The Minister of Finance in the provisional Uriburu Government announced Nov. 29, 1930, that budget reports covering previous years were unreliable. He estimated the accumulated budget deficit to the end of 1929 at 698,000,000 paper pesos. Actual expenditure in 1929, he said, appeared to total 973,070,000 paper pesos; actual receipts, 718,000,000 pesos. Actual receipts for 1930 were placed by the Finance Minister at about 616,000,000 pesos but no report on expenditures had been issued. No budget was in operation in 1931. The Provisional Government estimated receipts for the year at 650,000,000 paper pesos. President Uriburu, however, was reported to have financed the government by monthly decrees authorizing the expenditure of one-twelfth of the 1930 budget for each 30-day period. It was estimated in May, 1931, that this procedure would result in a deficit of 100,000,000 paper pesos by the end of the year.

According to the Argentine Corporation of Bondholders, the national consolidated debt on June 30, 1930, consisted of 1,051,435,000 paper pesos held abroad and 1,225,002,743 paper pesos held in Argentina, or a total of 2,276,437,743 paper pesos. The floating debt was placed at 565,495,454 paper pesos. Including the aggregate indebtedness of the Provinces (1,038,645,220 paper pesos) and of the municipalities (279,502,706 paper pesos), the grand total was 4,156,081,123 paper pesos, compared with 3,889,576,000 on June 30, 1928.

Argentine currency consists of gold and paper pesos, with a par value for the former of \$0.9648 and for the latter of \$0.4245. The gold peso had an average exchange value of \$0.8351 in 1930; the paper peso an exchange value of \$0.4186 in 1929. For fluctuations in Argentine exchange in 1931, see below under *History*.

COMMUNICATIONS. On Jan. 1, 1930, there were 23,795 miles of railway lines in operation, of which 5011 miles were state owned and 19,784 miles privately owned. About four-fifths of the private railways, or 65 per cent of the total, were the property of British interests. During 1930, according to the Federal Bureau of Railway Administration, five additional lines aggregating over 1000 miles in length, were completed and opened to traffic. The new 4.6-mile double track Lacroze subway line under the city of Buenos Aires was opened on Oct. 18, 1930.

Highways in 1930 extended 131,697 miles, of which only about 500 miles were hard-surfaced roads suitable for all-year motor traffic. Con-

struction of 800 miles of hard-surfaced toll highways was authorized by a Presidential decree of Dec. 24, 1930. The toll roads were to connect Buenos Aires with Rosario, Córdoba, Azul, and Bahía Blanca. Air-mail and passenger lines radiated from Buenos Aires to numerous Argentine and foreign cities. In April, 1931, however, the French Aero-postal suspended service on two lines from the capital to Asunción, Paraguay, and to the southern cities of Bahía Blanca, Comodoro Rivadavia, and Rio Gallegos. The Argentine Postoffice Department in May authorized the Pan-American Airways to establish air-mail service between Buenos Aires and New York via the Atlantic coast and the service was put in operation November 1. A bi-weekly service between the two cities via the Pacific coast was already in operation.

In 1930, 8951 steamers of 13,209,525 tons entered the ports of Buenos Aires and 10,903 of 13,230,206 tons cleared; sailing vessels entered numbered 11,000 of 2,057,729 tons, and those cleared 10,710 of 1,181,367 tons.

NAVY. See NAVAL PROGRESS.

GOVERNMENT. The Constitution, which was suspended upon the overthrow of the Irigoyen Government Sept. 8, 1930, vested executive power in a president elected for six years, and legislative power in a national congress, comprising a senate of 30 members elected for nine years, and a chamber of deputies of 158 members elected for four years. The Governors of the Provinces were vested with extensive powers and their functions were independent of the central executive. Provisional President in 1931, Lieut.-Gen. Don José Francisco Uriburu.

### HISTORY

THE PRESIDENTIAL ELECTION. The revolution which overthrew President Irigoyen and his Radical Administration in September, 1930, brought into power a provisional government headed by General Uriburu and dominated by the minority Conservative party which controlled the country previous to the electoral reforms of 1912. Pledged to the early restoration of constitutional government, General Uriburu assumed the office of Provisional President with the support of the majority of the nation. He promised that neither he nor the members of his Cabinet would enter the contest for the Presidency, but made it plain that he would not permit the return of the Irigoyen wing of the Radical party to power, even if it secured a majority. His programme envisaged elections in the Province of Buenos Aires on Apr. 5, 1931, to be followed by elections in the Provinces of Santa Fé, Corrientes, and Córdoba.

The partisan activities of Conservative leaders, some of whom were members of the Provisional Cabinet, gradually alienated public support. Great indignation was aroused by the proposal to abolish the secret ballot, introduced in 1912. The elections in Buenos Aires Province, April 5, completely upset General Uriburu's plans by returning a Radical plurality. The Radicals were short of a majority, however, the Socialist party holding the balance of power between the Radicals and the Conservatives. Faced with the prospect that the Radicals would return to power if a presidential election were held, General Uriburu postponed the elections in the other Provinces until November 8 and temporarily voided the Buenos Aires election by postponing the

meeting of the provincial electoral college, also until November 8. About the same time (April 17) he reconstituted his Cabinet on a non-political basis, retaining from the former Cabinet only the Ministers of War, Foreign Affairs, and Public Works. He made no response to the growing demand for the election of a constitutional President. The state of siege declared in September, 1930, was continued. And the Provisional government's continued advocacy of constitutional reform as a preliminary to the restoration of constitutional government aroused fears that the presidential election would be indefinitely postponed.

The Provisional President met the rising storm of opposition by suspending or censoring offending newspapers, dispersing student and Radical demonstrations, and clapping political opponents into jail. The establishment under the Government's sponsorship of an "Argentine Civic Legion," with many resemblances to Italian Fascism, aroused further hostility among liberal elements. The uncertain political situation was definitely retarding business within Argentina and hurting the country's credit abroad.

Meanwhile Marcelo T. de Alvear, President of the Argentine Republic from 1922 to 1928, had returned to Buenos Aires from Paris (April 25) and undertaken the reorganization of the Radical party in preparation for the presidential elections. Ex-President Alvear was leader of the anti-Irigoyenista wing of the Radical party, but his effort to enlist the Irigoyenistas in support of his candidacy aroused the open hostility of General Uriburu. When an abortive uprising in Corrientes Province occurred July 20, under the leadership of one of Irigoyen's former adjutants, Uriburu seized the opportunity. Accusing Dr. Alvear and his associates of complicity in the revolt, the Provisional President expelled them from the country. Several hundred other Radical leaders were imprisoned or detained in their homes, and the Radical headquarters in Buenos Aires were closed. With Alvear in exile in Montevideo, Uruguay, Uriburu finally yielded to the demand for a presidential election (August 28) and fixed the date for November 8, the same date for which Congressional elections were scheduled.

During August and September a new alignment of political parties took place in anticipation of the election. The Conservatives and a group of former Radicals opposed to Irigoyen united as the National Democratic party and nominated Gen. Agustín P. Justo as their candidate. General Justo had aided General Uriburu in the revolution and for a short time served under him as Minister of War until a difference of opinion arose and Justo resigned. His support came principally from the upper classes, the Church, and the political bosses of the Provinces, but he appealed also to the independent vote. Opposing the Conservative coalition, the Democratic, Progressive, and Socialist parties united under the banner of the "Alianza Civil" in support of Dr. Lisandro de la Torre, a man of liberal views. In September, the Radicals defied the Provisional government and nominated Dr. Alvear as their candidate. General Uriburu retaliated with decrees vetoing Alvear's nomination, and annulling permanently the April elections in Buenos Aires Province. The Argentine Constitution stipulated that an interval of six years must elapse before the reelection of a

former President and the Provisional government contended that Alvear's nomination clearly violated this provision. The latter's supporters asserted that Uriburu had in fact suspended the Constitution and that therefore its provisions did not apply. Alvear, from Montevideo, sent in his resignation as Radical candidate. The party convention was unable to agree on a new candidate and accordingly the Radicals were not represented in the November elections.

Supported by the Provisional government, General Justo won an overwhelming victory over Dr. de la Torre, according to preliminary returns. The process of verifying and counting the ballots was not completed at the end of the year. However, press reports of November 26 gave Justo 234 votes in the electoral college, as compared with 134 for Dr. de la Torre. Julio Roca, Justo's running mate, was elected Vice President. The only disorder reported during the elections was a minor street fracas in Arequillo, Santa Fé Province. While indirect news reports in December indicated that the President-elect was selecting members of his Cabinet in anticipation of the early assumption of office, General Uriburu gave no indication as to the date on which the Provisional government would resign.

**THE ECONOMIC AND FINANCIAL SITUATION.** Unlike several neighboring states, the Argentine federal and provincial governments did not default on interest and amortization payments on their foreign debts during 1931. The economic situation was distinctly unfavorable, however. There was a budget deficit of about 100,000,000 paper pesos and the Government failed to maintain the exchange value of the peso despite a 30 per cent curtailment of imports, the creation of a favorable trade balance of about 80,000,000 gold pesos, and the renewal of a \$25,000,000 loan in the New York market on satisfactory terms. Exports increased about 72 per cent in volume and 1 per cent in value during 1931, as compared with 1930. The Government during the year shipped more than 163,200,000 gold pesos abroad, part of it to Argentine legations, in an effort to stabilize foreign exchange. On October 3, however, the National Bank was forced to abandon its plan for artificial stabilization of the paper peso, which then declined to \$0.233 (par value \$0.4246). Following the November election, the peso showed renewed strength and business generally improved, but a decline in cereal prices during December again reacted against trade.

**FOREIGN RELATIONS.** Official relations with the United States government continued on a more cordial basis than during President Irigoyen's Administration. The United States tariff remained a source of irritation and complaint in Argentina. The Argentinian Ambassador to Washington, Manuel E. Malbran, in an address before the Foreign Trade Council in New York May 28, 1931, declared that certain clauses of the American tariff were directly discriminatory against Argentina. He said that Argentina might be compelled to increase its tariff rates in self-defense. The Ambassador's address was strongly approved by *La Nación* and *La Prensa*, the great Buenos Aires dailies.

In the political field, the Provisional government pursued a policy of collaboration with the other Latin American states, in contrast to the Irigoyen policy of isolation. The good offices of

the Argentine Foreign Minister led to the resumption of diplomatic relations between Ecuador and Colombia August 17. The Foreign Office attempted also to bring about the renewal of diplomatic relations between Bolivia and Paraguay, severed following the revival of the Chaco dispute (see BOLIVIA under *History*). However, the tariff policies followed by the Provisional government of Argentina produced repeated disputes with Uruguay, Brazil, and Paraguay. The concentration of Argentine exiles in Montevideo and the searching by Argentine officials of Uruguayan vessels on the River Plate resulted in some friction between the two Governments (see URUGUAY under *History*). On August 3, Argentine police raided the offices of the Soviet Union's trade organization headquarters in Buenos Aires, the Government having charged that the organization served as a centre for Communist propaganda.

Consult F. A. Kirkpatrick, *A History of the Argentine Republic* (New York, 1931); "International Competition in the Trade of Argentina," *International Conciliation*, June, 1931, No. 271.

**ARISTOGENESIS.** See ZOOLOGY.

**ARIZONA. POPULATION.** According to the Fifteenth Census, the population of the State on Apr. 1, 1930, was 435,573, as against 334,162 in 1920. The chief elements of the population in 1930 were: native whites, 248,787; Mexicans, 114,173; Indians, 43,726; and foreign-born whites (not Mexican), 15,591. Phoenix, the capital, had, in 1930, 48,118 inhabitants; Tucson, 32,506.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1931 and 1930:

Crop	Year	Acreage	Prod. Bu.	Value
Cotton	1931	176,000	119,000*	.....
	1930	215,000	155,000*	.....
Hay, tame	1931	126,000	364,000 <sup>b</sup>	\$3,276,000
	1930	120,000	332,000 <sup>b</sup>	4,316,000
Wheat	1931	24,000	672,000	444,000
	1930	22,000	616,000	647,000
Corn	1931	36,000	566,000	495,000
	1930	31,000	576,000	570,000

\* Bales. <sup>b</sup> Tons.

**MINERAL PRODUCTION.** Arizona continued to produce, in 1930, more than 40 per cent of the United States' yearly yield of copper, but as the copper-mining industry had entered into a period of severe depression, Arizona's production, like that of other States, was radically reduced. It amounted, for 1930, to 570,897,080 pounds, as against 829,206,475 pounds for 1929. Because of a reduction in the average price for the year, the copper mined in 1930 had a value of less than \$80,000,000, as compared with a value of \$146,190,000 for the total of 1929. The effect of this decline on the State's mineral industry was the more severe as copper normally furnished more than 90 per cent of its mineral production. Since the gold output was in part subsidiary to the mining of silver, the production of both these precious metals likewise diminished in 1930, by reason of depression in the world's markets for silver. There were produced, in 1930, 148,681 fine ounces of gold and, in 1929, 211,108; by value, \$3,073,500 in 1930 and \$4,364,000 in 1929. The quantity of silver mined was 4,910,394 fine ounces for 1930 and 7,840,321 for 1929; the value, because of a much reduced price for bar silver, fell to \$1,890,502 for 1930, from

\$4,178,891 for 1929. Lead, the only other mineral listed as normally yielding value in excess of \$1,000,000 a year, was produced in 1929 to the quantity of 8027 short tons and to the value of \$1,011,410. Stone of grade averaging less than a dollar a ton was produced in 1929 to the total value of \$582,406. For 1929 the total value of the State's mineral production was \$157,959,792; for 1928, \$115,999,643.

The value of gold, silver, copper, and lead produced by mines in Arizona in 1931 was about \$36,529,235, a marked decrease from \$81,042,416, the value of these metals with that of zinc in 1930, according to estimates of the U. S. Bureau of Mines. There was a pronounced decrease in the output and value of all five metals and especially in copper, the average price of which in 1931 was less than any average price from 1850 to 1931. The copper output was less than any annual production since 1922. The copper smelting plants at Douglas, Hayden, Clifton, and Miami were active the entire year at a greatly reduced rate; the plants at Clemenceau and Superior were idle about three months; the smelter at Clarkdale closed in May; and the copper plant at Humboldt and the lead smelter at Douglas were idle the entire year. Despite the fact that many of the copper producers found that the cost per pound of producing copper exceeded the average sales price in 1931, Arizona retained its place as the largest producer of copper in the United States. It also exceeded all other States in the total value of the five metals, although the value in 1931 was less than that of any year since 1921. As in 1930 there was a large decrease in the output of gold and silver corresponding to the unusual decrease in the output of copper. There was also a large decrease in the lead output, and no zinc ore was mined or treated in 1931. The gold output decreased from \$3,501,610 in 1930 to about \$2,554,000 in 1931 due chiefly to the pronounced curtailment in the output of copper ore. There was a revival in gold mining in Arizona after the serious decline in other metal prices, as shown by the great number of smaller producers of gold ore and bullion, chiefly from Yavapai County. The silver output decreased from 5,540,732 ounces in 1930 to about 3,157,000 ounces in 1931, and the value from \$2,133,182 to about \$915,500 as the price of silver continued to decrease from an average of 38.5 cents an ounce in 1930 to 29 cents an ounce in 1931. The output of silver in 1931 was the smallest since 1921 and the average price was less than that of any year since 1850. The copper output decreased from 576,190,607 pounds in 1930 to about 397,600,000 pounds in 1931, and the value from \$74,904,779 to about \$33,000,000. The average price of copper decreased from 13 cents a pound in 1930 to 8.3 cents a pound in 1931, the lowest price recorded since 1850. The mines of Arizona, therefore, curtailed production decidedly and the copper output in 1931 was 31 per cent less than that of 1930; it was the smallest output since 1921. The lead production in Arizona decreased from 8,491,623 pounds in 1930 to about 1,550,000 pounds in 1931, and the value from \$424,581 to about \$58,900. As the average price of lead decreased from 5 cents a pound in 1930 to 3.8 cents a pound in 1931, all the large producers of lead in Arizona were idle, which resulted in an output less than that for any year since detailed statistics of production were recorded in 1903. No zinc was produced

from mines in Arizona in 1931 although the output in 1930 was 1,630,506 pounds valued at \$78,284.

**MANUFACTURES.** Federal Census data obtained in 1930 and covering 1929 gave the number of the State's manufacturing establishments as 347. These employed 10,500 wage earners, to whom were paid in the year wages totaling \$15,077,675. These wages exceeded the total for 1927 by nearly 25 per cent. The cost of the manufacturers' materials, fuel, and purchased electric current for 1929 was \$139,256,443. The manufactured products were valued at \$199,370,650.

**FINANCE.** State expenditures of the year ended June 30, 1930, as reported to the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$7,674,767 (of which \$2,134,505 was for local education); for interest on debt, \$123,980; for permanent improvements, \$4,268,418; total, \$12,067,165 (of which \$5,088,079 was for highways, \$1,483,580 being for maintenance and \$3,604,499 for construction). Revenues were \$12,692,234. Of these, property and special taxes formed 54.7 per cent; departmental earnings and remuneration to the State for officers' services, 4.2; sale of licenses, 21.6 (including gasoline sale taxes amounting to \$1,662,739). The State's funded debt outstanding on June 30, 1930, was \$351,710. Net of sinking-fund assets, it was \$295,160. On a property valuation of \$704,324,090 were levied in the year State taxes of \$6,627,463.

**TRANSPORTATION.** The total number of miles of railroad line in operation on Jan. 1, 1931, was 2403.84. There had been no important increase or decrease of line mileage in the year preceding. In 1931 was built 0.87 mile of new second track.

**EDUCATION.** There were enrolled in the public schools of the State, in 1930, 111,097 pupils. Of these, 95,838 were in common schools or elementary grades, and 15,259 were in high schools. Expenditures for public-school education in the academic year 1929-30 totaled \$11,512,921. Salaries of classroom teachers, by the year, averaged \$1945 in high school and \$1550 in elementary classes. State Superintendent Case, writing in the *Journal of the National Education Association*, stated that school boards had succeeded during 1931 in materially reducing maintenance budgets without reducing educational efficiency.

**CHARITIES AND CORRECTIONS.** The State institutions having the care or custody of individuals, under the law as existing in 1931, were under the control of the Board of Directors of State Institutions. Each institution was administered directly by a superintendent under the authority of this board. The Board consisted of three members, the Governor (who was president of the Board), the State Treasurer and a Secretary (C. M. Zander), who was executive officer and purchasing agent. The institutions thus controlled, with their populations as rendered in December, were: State Prison, Florence, 602; State Hospital for the Insane, Phoenix, 846; Pioneers' Home, Prescott 169; State Industrial School, Fort Grant, 80; State School for Girls (juvenile offenders), Randolph, 20.

**POLITICAL AND OTHER EVENTS.** Arizona lost in its effort to prevent the construction of the Hoover Dam on the Colorado River, on its western border. The U. S. Supreme Court, in a decision of May 18, refused the injunction that the State had sought against the construction of the dam.

The Court's majority opinion held the plan for the dam to be constitutional in spite of Arizona's objection, but allowed the State the right to take legal action in the future, in case that it should contend that its rights had by then actually been impaired. The decision brought to a close the persistent efforts of many years by which the State had sought to prevent the progress of the project, which had been planned on terms not judged sufficiently favorable to Arizona's rights and interests.

The extremely depressed state of the copper-mining industry was most severely felt in Arizona, which was not only the leading producer of copper among the States, but relied on this industry far more than any other State for its economic welfare. Governor Hunt led an effort on the part of the State's interests to induce the Tariff Commission to investigate imports of copper with a view to setting up a protective tariff on behalf of the domestic producers.

**LEGISLATION.** The tenth State Legislature held its regular session. It passed an act requiring that citizens of the State have preference in employment on all public work under State control, notably on road construction. This law bore in great part on immigrants from Mexico. A further step to restrict them was taken in the adoption of a memorial petitioning Congress to extend the quota system to apply to Mexican immigration. In another memorial Congress was petitioned to enact a tariff on imports of copper, the State's chief mining product, of which the reduction in output had severely affected Arizona. Building and loan associations were subjected to taxation on the same basis as banks. A highway patrol system was created. An act to abolish hanging as the method of capital punishment and to substitute death by lethal gas was passed, but was declared by the State Attorney General to be unconstitutional, in that hanging had been prescribed by an initiative measure of 1918 and that the State Constitution prohibited the Legislature's amending such a measure. A nepotism bill was enacted, forbidding officials from appointing relatives to office. Provision was made for the purchase, jointly with California, of a toll bridge crossing the Colorado River at Ehrenberg. The Legislature passed a measure for State control of trade in narcotics, independently of the Federal Harrison act.

**OFFICERS.** Governor, George W. P. Hunt; Secretary of State, Scott White; Attorney-General, K. Berry Peterson; Treasurer, Mit Simms; Auditor, Ana Frohmler; Superintendent of Public Education, C. O. Case.

**JUDICIARY.** Supreme Court: Chief Justice, A. G. McAlister; Associate Judges, Henry D. Ross, Alfred C. Lockwood.

**ARIZONA, UNIVERSITY OF.** A coeducational State institution of higher learning in Tucson, Ariz., founded in 1885. The 1931 autumn enrollment totaled 1903; the registration for the summer session of 1931 was 407. The faculty numbered 190. The endowment fund amounted to \$20,000, and the income for the year was \$1,478,700. The university receives both Federal and State support. The library contained approximately 85,700 volumes. President, Homer LeRoy Shantz, Ph.D., Sc.D.

**ARKANSAS. POPULATION.** According to the Fifteenth Census, the population of the State on Apr. 1, 1930, was 1,854,482, as against 1,752,204 in 1920. The number of native whites in-

creased to 1,364,733 for 1930, from 1,265,782 for 1920; that of the negroes, to 478,463 for 1930, from 472,220 for 1920; while the number of the foreign-born whites fell to 10,173, from 13,975. The capital, Little Rock, had, in 1930, 81,679 inhabitants. Forth Worth had 31,429.

The number of persons gainfully employed in 1930 was 548,652 males and 119,193 females. About two-fifths of the employed males were in the farm group, laborers on farms included. The farmers alone numbered 226,211. Factory operatives and laborers numbered 31,448 males and 2490 females.

**AGRICULTURE.** The following table shows the acreage, production and value of the principal crops for 1931 and 1930:

Crop	Year	Acreage	Prod. Bu.	Value
Cotton	1931	3,562,000	1,855,000*	.....
	1930	3,908,000	874,000*	.....
Corn	1931	1,954,000	43,965,000	\$16,267,000
	1930	1,776,000	8,347,000	8,013,000
Hay, tame	1931	570,000	701,000*	5,818,000
	1930	486,000	482,000*	6,394,000
Rice	1931	177,000	9,381,000	5,722,000
	1930	172,000	8,170,000	6,373,000
Oats	1931	160,000	4,160,000	1,248,000
	1930	94,000	1,739,000	904,000
Potatoes	1931	43,000	3,784,000	2,081,000
	1930	31,000	2,697,000	3,102,000
Sweet potatoes	1931	32,000	2,880,000	1,584,000
	1930	23,000	1,932,000	1,835,000

\* Bales.    • Tons.

**MINERAL PRODUCTION.** The serious diminution in the production of petroleum, which had constituted the greater part of the State's yearly mineral product, continued in 1930. The quantity of petroleum produced was 19,663,000 barrels for 1930, as against 24,917,000 for 1929; the value, \$17,700,000 (estimated) for 1930, as against \$21,890,000 for 1929. The production of natural gas was, for 1929, 19,928,000 M cubic feet, delivered to consumers; the value, \$3,802,000. This was slightly less than the total for 1928 as to quantity, but somewhat greater as to value. There was a substantial production of gasoline from natural gas. Gasoline thus produced amounted in 1930 to 31,800,000 gallons and in 1929 to 33,455,000; the total for 1930 was valued at \$1,800,000 (estimate) and that for 1929 at \$2,419,000. Coal produced in 1930 amounted to 1,590,000 short tons; in 1929 to 1,695,108 tons valued at \$5,624,000. Arkansas continued to produce almost all the domestic supply of the aluminum ore, bauxite; the quantity mined in 1930 was 315,273 long tons, as against 351,054 in 1929; the value of this product was \$1,823,389 for 1930 and \$2,181,158 for 1929. Clay products totaled \$2,024,403 (1929). The total value of the State's mineral production was \$41,324,576 for 1929; for 1928, \$45,009,780.

**MANUFACTURES.** Federal Census data obtained in 1930 and covering 1929 gave the number of the State's manufacturing establishments as 1731. These employed 44,073 wage earners, to whom were paid wages, during 1929, totaling \$39,221,333. Both the number of wage earners and the total of the year's wages were up more than 10 per cent above the corresponding totals for 1927. Materials used in manufacture in 1929 cost \$110,796,257; fuel and purchased electricity, \$4,233,660. Products of manufacture were valued at \$208,897,093. The value added to them by manufacture was reckoned at \$93,867,176.

**FINANCE.** State expenditures in the year ended June 30, 1930, as reported by the U. S. De-

partment of Commerce, were: for maintenance and operation of governmental departments, \$16,545,942 (of which \$4,362,586 was for local education); for interest on debt, \$5,960,784; for permanent improvements, \$24,870,887; total, \$47,460,224 (of which \$24,660,783 was for highways, \$2,678,313 being for maintenance and 21,982,470 for construction). Revenues were \$24,776,007. Of these, property and special taxes formed 29.9 per cent; departmental earnings and remuneration to the State for its officers' services, 5.4; sales of licenses, 54 (including taxes of \$6,314,943 on sales of gasoline). The State's funded debt outstanding on June 30, 1930, was \$120,468,757 (for highways alone, \$104,016,590). Net of sinking-fund assets, it was \$120,443,316. On property bearing an assessed valuation of \$624,324,850 were levied in the year State taxes of \$4,932,160.

**TRANSPORTATION.** The total number of miles of railroad line in operation on Jan. 1, 1931, was 4826. Additions to the mileage of line during the year preceding had totaled 39.79, while mileage given up had amounted to 23.13. In 1931 there were built 2.37 miles of new second track.

**EDUCATION.** As reported in December, the school population of the State was 629,296. The enrollment of pupils in the public schools totaled 456,054. Of this total, 410,274 were in common schools or elementary grades, and 45,880 were in high schools. The salaries of teachers averaged \$667 a year. A move in the organization of the public school system was made by the legislative session of 1931. According to State Superintendent Hirst, writing in the *Journal of the National Education Association*, the enactments of 1931 provided for the election of the Commissioner of Education and the county superintendents by boards of education to be elected in their turn by popular vote; also for a system of school budgets and for the limitation of school indebtedness.

**LEGISLATION.** The forty-eighth regular biennial session of the Legislature extended from January 12 to March 12. Its appropriation bill provided \$68,000,000 for carrying on during the ensuing two years the State's programme of road construction. A statute was enacted to enable nonresidents to sue for divorce after a residence of 90 days in the State. The law on public education was recodified and provision was made for a State Superintendent of Public Instruction, to be appointed by a State Board of Education, the latter to consist of seven members to be appointed by the Governor. School districts were limited, in their bonded debt, to 7 per cent of assessed property valuation; the districts' budgets were made to depend on the endorsement of the State Board of Education; and provision was made for consolidations of existing school districts. The reaction to extensive bank failures in the previous autumn took the form of statutory restrictions upon the granting of loans by chain banks to officers, directors or proprietary interests. The State tax on sales of gasoline was raised to 6 cents a gallon, from 5 cents, to help provide for the service of highway bonds. Duty was placed on cigarettes at the rate of 50 cents a thousand, of which the proceeds were to augment the school fund; and a tax of 10 per cent on cigars was repealed.

To provide aid to agriculture, the Arkansas Agricultural Credit Board was created and the

issuance of \$1,500,000 in State bonds to provide relief for drought-stricken farmers was authorized. A State-wide system of audits for the accounts of counties and townships was created and the fiscal year for the counties was required to correspond with the calendar year. There were created a State Department of Aeronautics and a State Bureau of Criminal Investigation. Appropriation was made of \$3,000,000 to provide a new plant for the State Hospital for Nervous Diseases. Persons convicted of driving while intoxicated were prohibited by statute from operating motor vehicles for one year after conviction.

**POLITICAL AND OTHER EVENTS.** Rural destitution occasioned by the drought of 1930 came to a crisis in parts of Arkansas in January. In the town of England the stores were invaded by needy country inhabitants on January 3. The American Red Cross dispensed provisions there and elsewhere in the State for some weeks after. The State, despite its industrial depression, was able later to sell \$15,000,000 of its highway bonds, with the proceeds of which it was intended to complete the 9000-mile road programme started in 1927 and to furnish much needed employment for inhabitants. The Hudspeth chain of State banking institutions, which had temporarily suspended in November of 1930, was again involved in difficulties late in the summer. The State's "full crew" laws affecting railroads were sustained in the Federal Supreme Court on April 14, against the attack of the Missouri Pacific R.R. Co. The Arkansas River area suffered in April a severe affliction of buffalo gnats causing considerable loss to livestock in that region.

Thaddeus H. Caraway, (q.v.) the State's junior senator, died on November 6, about a month before the convening of Congress. On November 13 Governor Parnell appointed the late senator's widow, Hattie Caraway, to be senator *ad interim* to succeed her husband. An election to fill the seat for the unexpired term to end March 4, 1933, was called for January 12, and the Governor called on the Democratic State Committee to make Mrs. Caraway the nominee.

**OFFICERS.** Governor, Harvey Parnell; Secretary of State, Ed. F. McDonald; Treasurer, Ralph Koonce; Auditor, J. O. Humphries; Attorney-General, Hal L. Norwood; Superintendent of Public Instruction, C. M. Hirst.

**JUDICIARY.** Supreme Court: Chief Justice; Jesse C. Hart; Associate Justices, Frank G. Smith, T. H. Humphreys, William F. Kirby, Thomas M. Mehaffey, E. L. McHancey and Turner Butler.

**ARKANSAS, UNIVERSITY OF.** A coeducational State institution of higher learning in Fayetteville, Ark., founded in 1871. It comprises the colleges of arts and sciences, education, engineering (including experiment station), agriculture (including experiment station), graduate school and schools of law, business administration, and medicine, the last named being in Little Rock. In the autumn of 1931 the enrollment was approximately 2000, and for the summer session it was 1017. The number of faculty members was 200. The endowment amounted to \$132,000, and the income for the fiscal year ending June 30, 1931, was \$1,480,000. The library contained approximately 105,000 volumes. Among the important gifts received during the year was \$5,000 a year for three years, beginning January, 1931, for museum purposes from the Carnegie Founda-

tion. The Legislature also appropriated in March, 1931, \$1,000,000 for the construction of a library, chemistry building, and medical school building. President, John Clinton Futrell, LL.D.

**ARMAMENTS, LIMITATION OF.** See **DISARMAMENT**; **NAVAL PROGRESS**; **MILITARY PROGRESS**; **GREAT BRITAIN, FRANCE, AND ITALY under History.**

**ARMENIA.** The name applied, since Dec. 2, 1920, to the Socialist Soviet Republic of Armenia. On Jan. 16, 1923, Armenia became one of the three constituent republics of the Transcaucasian Socialist Federated Soviet Republic (q.v.), which is a member of the Union of Soviet Socialist Republics. Capital, Erivan, with a population of about 75,000 in 1929.

Occupying the southwest frontier region of Transcaucasia, and bounded by Turkey and Persia on the west and south, respectively, Armenia has an area of 11,945 square miles and a population of 876,557 (1926 census). About 100,000 pupils are enrolled in elementary schools. The country is essentially agricultural, with a cultivated area of about 1,000,000 acres in 1929-30, including more than 44,000 acres devoted to cotton. On May 10, 1931, there were reported to be 682 collective farms, comprising 37,755 households, or 25 per cent of the total peasant households. In the first ten years of the Soviet régime, the construction of 187 miles of canals placed 900,000 acres of land under irrigation. Ten new hydro-electric plants were constructed also. The production of Armenian state industry (1929-30) was valued at 49,000,000 rubles (1 ruble equals about \$0.515 in the Soviet Union). See **UNION OF SOVIET SOCIALIST REPUBLICS.**

A severe earthquake shook the region on the Armenian-Persian frontier in March, 1931, killing about 500 persons, injuring more than 11,000, and destroying numerous villages and thousands of horses, cattle, sheep, and goats.

**ART EXHIBITIONS.** IN EUROPE. The Exhibition of Persian Art which opened in London at Burlington House January 6 was a revelation to the majority of Occidentals who thronged its rooms, of the vast and immensely ancient culture of Persia. It is not impossible that this exhibition may count in the future as a landmark in the development of international artistic appreciation, so vividly did it present a panorama of the ancient culture whose influence upon Western art in the past is being more and more stressed by archaeologists and art historians, and which stands to-day as a symbol of that East to which economic and political attention is being constantly attracted. The crafts of medieval and renaissance Persia, especially in the fields of illuminated manuscripts and rugs, have hitherto been the best-known forms of Persian art in Europe, but this exhibition traced the development of Persian art for over 5000 years, through examples of early pottery and carvings as well as photographs of architectural work and colossal rock sculpture recalling originals which could not otherwise be represented in London. Silk carpets, faience, glass, ceramics, metalwork, textiles, ivories, enamels, and manuscripts were present in abundance, lent by the Persian government, by public and private collectors, and by

dealers in Europe and the United States. It is probable that no such collection of objects illustrating the art and culture of any one people has ever before been assembled. Already its influence has been shown in the spread of interest in Near Eastern art—in the publicity received by the American Institute for Persian Art and Archaeology, for instance, in Persian and Islamic exhibitions in the United States, and even in so popular a fashion as an increased demand for reproductions of Near East paintings for decorative purposes.

Later in the season an exhibition of Indian Art was held in London by the Burlington Fine Arts Club as a sequel to the Persian Exhibition. This exhibition, which covered more than 2000 years of artistic development, included sculpture and painting lent by the King and by the ruling princes of India and private collectors, as well as examples of Indian art and craftsmanship in various fields.

Another interesting, though less widely known London exhibition, was that of Scottish art, including personal historical relics and a group of paintings which gave an excellent idea of the development of this art in Scotland from the fifteenth century to the present, with its varying French and Flemish trends.

The Exhibition of Byzantine Art held in Paris at the Musée des Arts Décoratifs during the summer was of especial interest to those who find pleasure in fine decoration and in the subtleties of blended Eastern and Western traditions which characterize Byzantine work. This exhibition, which embraced ivories, enamels, metalwork and jewelry, textiles, and parchments, included also examples of work of the first centuries of the Christian Era technically classified as Early Christian, but essential for completeness and contrast in such a collection. The exhibition was assembled by the College Art Association and included many American loans.

The great Colonial Exposition held at Vincennes from May to November (see **EXPOSITIONS**) was, of course, the occasion for assembling many examples of the arts as well as the economic products of the countries represented, an outstanding example being the reproduction of the great temple of Angkor. The Museum of the Colonies was to be preserved as a permanent institution.

The exhibition of early German paintings held at the Germanic National Museum in Nuremberg during the summer was of especial importance for students of the Germanic primitives.

London's interest in the Near East was paralleled in Berlin by an exhibition of one hundred and forty-seven paintings by an almost equal number of contemporary Japanese artists, an interesting blend of the modern and Far Eastern trends.

IN THE UNITED STATES. In the United States modern French paintings took first place among exhibitions, with a steadily growing amount of contemporary and older American work and a considerable interest in the Near East, reflected from the Persian Exhibition in London.

The Brooklyn Museum held a loan exhibition of Persian Art, including pottery, textiles, metalwork, and illuminations, in the early spring, emphasizing, as did the London exhibition, the early development of Persian culture. In May and June the Metropolitan Museum held a loan exhibition, which had been contemplated

for many months, of Near Eastern ceramics from the seventh to the eighteenth century, including examples of special interest to designers as well as to students of Islamic art, and in November the Cleveland Museum held an exhibition of Persian Art in which were shown a number of pieces lent during the winter to the London Exhibition.

With regard to French paintings, the memorial exhibition of the work of Jules Pascin at the Downtown Galleries in New York was carried over through the first of the year, and early in January the Marie Harriman Galleries opened the first one-man show of the work of Henri Rousseau, whose simple and direct but imaginative interpretations have been growing steadily in popularity. From this time on the exhibitions of the New York galleries featured an almost continuous presentation of Matisse, Fernand Leger, Picasso, Braque, Derain, Dufy, and the earlier men from whom they stemmed.

Outstanding among the exhibitions of modern French work in museums were, of course, those of the French Museum under the able guidance of Maud Dale. The year at the French Museum began with "Paintings of Women, Romanticism to Surrealism." Next came canvases by Picasso, Braque, and Leger, followed, in March, by the first of two exhibitions assembled to illustrate selected themes. The March exhibition showed "Degas and His Tradition," including examples of the Oriental work which influenced this painter and his group so strongly, while in November came its companion, perhaps a little more far-fetched, "Renoir and His Tradition," tracing the development of this line of influence from the sixteenth century.

The Museum of Modern Art showed, early in the year, a finely contrasted exhibition of the works of the racy, full-blooded, often satiric Toulouse-Lautrec combined with that of the poet-mystic, Odilon Redon. After an exhibition of the work of contemporary German painters and sculptors during the spring, this museum opened in May a memorial exhibition of the collection of Lizzie P. Bliss, the greater part of which consisted of the works of Cézanne, Renoir, Degas, Gauguin, and other members of the "modern" Frenchmen of the nineteenth and early twentieth centuries, with examples of their American disciples. The greater part of this collection becomes the property of the Modern Museum if it is able to comply with certain conditions which will undoubtedly be met. The museum's fall season opened with an exhibition of paintings by Matisse, the fifth and most comprehensive of such shows held in the United States.

French exhibitions were by no means confined to New York. The Cincinnati Museum arranged an exhibition of paintings by Derain to open the holiday season of 1930-31; the City Art Museum of St. Louis held, early in the year, an exhibition of French painting from David to Corot, Courbet, Millet, Daumier, Manet, Monet, Pissarro, Renoir, and Degas, followed in the spring by an exhibition of the Post-Impressionists. The Carnegie Institute of Pittsburgh exhibited in May and June twenty-nine examples of outstanding modern French paintings from the Chester Dale Collection; and the Detroit Institute of Arts opened in May an exhibition of French paintings from Renoir to the present.

Among the outstanding exhibitions of American painting during the year was that which

opened the new Whitney Museum of American Art in November. The Forty-fourth Annual Exhibition by American Painters and Sculptors at the Art Institute of Chicago from October 29 to December 31 was also an event of considerable importance, displaying American work of a class perhaps equal to that shown at the Carnegie International at Pittsburgh. The Chicago Exhibition included 218 paintings and 62 pieces of sculpture, the paintings, especially, being marked by a lively contemporary character, and including a number from the West and the Middle West. The first prize, the Mr. and Mrs. Frank G. Logan Medal and \$2500, went to Morris Kantor for his painting, "Haunted House." The other two Logan Medals went to sculpture, the second, with \$1500, to William Zorach for his group "Mother and Child," and the third, with \$500, to John Storrs for "Seated Torso." The Twenty-sixth Annual Exhibition of Paintings by American Artists at the City Art Museum of Saint Louis recalled the fact that America is an out-of-door country and that landscapes have long held a first place in American painting, for the show abounded in typically American shore and street scenes.

The Detroit Institute of Arts showed at its Seventeenth Annual Exhibition of American Art work ranging from that of the Munich school, represented by a room hung with the paintings of Julius Rolshoven, to the present. One room was devoted to paintings by Arthur B. Davies, while the gallery of work by living artists contained 60 examples. Another interesting exhibition which had the advantage possessed by the Carnegie International of showing American work in its relation to that of Europe, was held at the Pennsylvania Museum. It included 75 canvases by living artists, about half of them American, selected to illustrate definite contributions to modern painting. Two exhibitions at the Metropolitan Museum were devoted to American work—the Twelfth Annual Exhibition of Industrial Art and the Memorial Exhibition of the Work of Robert Henri.

Several extremely interesting exhibitions fell outside the fields of French, American, or Near Eastern influence. One of the most unusual of these was that of Russian icons, shown at various American museums beginning with the Museum of Fine Arts in Boston and the Metropolitan Museum, arranged by the American-Russian Institute. Covering about a thousand years of the Byzantine tradition, this exhibition not only illustrated the little-known phases of Orthodox Russian painting on a larger scale than the small icons hitherto known in this country, but presented as well a great body of late medieval and early Renaissance work in which the influences forming the background for Giotto and the other early Italian rebels from tradition could be studied clearly.

Among the various exhibitions held at the Metropolitan Museum aside from those already mentioned were a loan exhibition of armor and tapestries which included several fine Gothic hangings from the collection of Clarence Mackay, such as the "King Arthur" and "Hector and Andromache"; and an Exhibition of Chinese Court Robes and Accessories which was a revelation of the fineness of Chinese weaving and embroidery and of its elaborate symbolism.

Another notable subject exhibition was that of landscape painting from the fifteenth century

to the present opened in January at the Wadsworth Atheneum and Morgan Memorial in Hartford, and echoed later by various galleries. The Hartford exhibition traced the development of landscape from a purely subordinate place as mere background to the dominant position it came to occupy among many artists of later times.

The Exhibition of American Primitive Painting which opened at the Newark Museum in 1930 was carried over into 1931, and was followed in the fall by a second step toward the tracing of American beginnings—an Exhibition of American Folk Sculpture. This included such work as ships' figureheads, cigar-store figures, and Pennsylvania Dutch stove plates, and is more fully discussed under the heading of Sculpture (q.v.). The American Folk Art Gallery, opened about the same time, exhibited later in the fall a group of "primitive American" paintings similar to those shown in 1930-31 at Newark.

The Exhibition of Modern Hungarian Art, assembled by the College Art Association for circulation and shown first at the Silberman Galleries in New York, showed certain close relationships to the "American primitive" work in its direct transcription of objects as seen by untrained or "natural" painters. An interesting subject exhibition might, indeed, be formed by a combination of paintings from these two groups with those of Rousseau, for the same simplicity, though expressed with considerable more genius, marks the work of that humble custom's clerk. Another expedition into primitive work, of a different type, was also made by the College Art Association in assembling its Exhibition of the Tribal Arts of the American Indians which opened in the fall at the Grand Central Galleries in New York.

Other interesting exhibitions were that of Byzantine Art held at the University of Chicago during the fall and showing a number of examples from the Paris Exhibition, and an Exhibition of Japanese Art presented at the Toledo Museum.

The Third International Antiques Exhibition at Grand Central Palace also attracted much attention. Period rooms and alcoves decorated in period styles furnished the background for the exhibits, and the first prize was awarded to Charles of London for a Gothic interior.

CARNEGIE INTERNATIONAL. The Thirtieth Carnegie Institute International Exhibition of Paintings opened in Pittsburgh October 15 with a total of 496 paintings, the largest for many years. Of this total, 332 were by Europeans and 164 by Americans. Two hundred and eighty-one artists were represented, including 157 from European countries and 124 from the United States, while 16 nations took part in the exhibition. It was an American year, the French, German, and English groups being less forceful than usual. The Polish work was unusually interesting. Five out of the seven awards went to painters from the United States, an unusual number. The first Carnegie Prize of \$1500 and the Lehman prize of \$2000 for the best painting for sale went to a young Philadelphian, Franklin G. Watkins, for "Suicide in Costume," thus concentrating two awards upon one American artist. The second Carnegie Prize of \$1000 was awarded to an Italian, Mario Sironi of Milan, for "Fishermen"; the third prize of \$500 went to Raoul Ruyf, the French modernist, for "The Avenue of the Bois de Boulogne,"

First honorable mention, which carries a cash award of \$300, went to the American, Judson Smith, for "A Deserted Village"; and an honorable mention to Yasuo Kuniyoshi, born in Japan but a resident in the United States, for "Still Life." The Allegheny County Garden Club Prize for the best painting of gardens or flowers went to Andrew Dasburg, an American, for "Bouquet." Most of the artists were represented by groups of two or three paintings in order to give a better opportunity for studying the character of their work. The prizes were awarded by a jury of six composed of Henri Eugene Le Sidaner of Paris; Cipriano Oppo of Rome; Paul Nash of London; and three Americans, Randall Davey, Jonas Lie, and Eugene Speicher, with Homer Saint-Gaudens presiding.

PENNSYLVANIA ACADEMY EXHIBITION. The One-hundred-and-Twenty-sixth Annual Exhibition of the Pennsylvania Academy of Fine Arts at Philadelphia, held from January 25 to March 15, included 301 paintings and 148 pieces of sculpture, and represented the work of 388 artists. The exhibition was varied in character, including work by both the conservative and the modern schools in landscape, portraiture, and "subject-pictures," as well as small bronzes and larger sculpture. The influence of the French school, both direct and indirect, was noticeable, as was to be expected. The prizes were awarded as follows: the Temple Gold Medal to Alexander Brook of New York for "The Intruder"; the Walter Lippincott Prize to Sidney E. Dickinson of New York for "Mary"; the Mary Smith Prize to Mildred B. Miller of Chester Springs, Pennsylvania, for "Yuan Shi Kuo"; the Jennie Sesnan Gold Medal to John Folinsbee of New Hope, Pennsylvania, for "Canal and River"; the Carol H. Beck Gold Medal to John Sloan of New York for "The Sculptor Vagis." The sculpture prizes, two in number, went to Gladys E. Bates of Mystic, Connecticut, for "Eve," and Edward McCartan of New York for "Dionysius."

THE NATIONAL ACADEMY OF DESIGN. The National Academy of Design awarded three sets of prizes in 1931 due to the fact that the autumn show of 1930 was confined to members and no prizes were then given. The principal prizes held over for the One Hundred and Sixth Exhibition in the spring of 1931 were awarded as follows: the First Altman Prize of \$1000 to Gifford Beale for his painting, "Man with Lobster Pots"; the Second Altman Prize of \$500 to Jerome Myers for the painting, "Street Scene." The First Altman Prize regularly awarded in the spring went to Aldro T. Hibbard for "Rockport in Winter"; and the Second to Spencer Nichols for "Jeweled Hills." The Altman prizes awarded at the fall exhibition of the Academy were: First Prize to Eugene Higgins for "The Black Cloud," and Second to Charles E. Chambers for "Mr. John Alonzo Williams." The exhibits throughout the year were marked by close adherence to the conservative school.

PRIX DE ROME AWARDS. The American Academy in Rome awarded in May, 1931, the following fellowships: In sculpture to Warren T. Mosman of Bridgeport, Conn., in painting to Harry G. Ackermann of New York City, both graduates of the Yale School of Fine Arts.

**ART MUSEUMS.** The year 1931 was marked by the passing of several great private collections into the hands of museums or municipalities, and by the opening of important new sections or additions in several museums.

At the close of the year the collection of Colonel Michael Friedsam passed to the Metropolitan Museum, New York, for exhibition during 1932. This collection is especially rich in French and Flemish primitives, as well as paintings of the Dutch and Italian schools, including Botticelli, Titian, and Rembrandt, and works by Goya, Velázquez, and Murillo, with fine examples of sculpture, enamel, bronzes, and ceramics. Its acceptance was delayed for some months because of the necessity of reaching a solution of the problem presented by Colonel Friedsam's desire that the collection be kept together, which presented difficulties in Museum arrangement, but such a solution was finally reached, and while a nucleus of the collection will be displayed by itself and all objects will be labeled to show their origin, the collection will not be static, but may be changed from time to time and objects from it displayed in other galleries with the regular collections.

Early in December the Metropolitan Museum opened an addition to the American Wing consisting of a reconstruction of the great hallway of the Van Rensselaer manor house at Albany, built between 1765 and 1768, containing the original woodwork and painted scenic wall paper, given to the Museum by the late Dr. Howard Van Rensselaer and Mrs. William Bayard Van Rensselaer. The hall is furnished with pieces of the period, though not from the Rensselaer house. Adjoining it is a smaller room, connecting it with the main body of the American Wing, lined with woodwork from a house in Providence, R. I., built in 1795.

In this year, also, the Theodore M. Davis Bequest, which for a long time has been the subject of litigation, became the property of the Museum. This bequest includes many important Egyptian antiquities, for Mr. Davis was a tireless worker in the field of Egyptology, as well as a number of fine paintings, such as an early Madonna and Child by Giovanni Bellini, a signed work by Bartolommeo Vivarini, a Madonna and Child once attributed to Masolino, several portraits by Moroni, a Madonna and Child probably by Dirk Bouts, and works by Cuyp, Guardi, Monet, Corot, Rousseau, and Monticelli. The collection also includes sculpture and decorative arts. Among other acquisitions of the Metropolitan Museum were three paintings by Arthur B. Davies, together with a Byzantine painting and fine metalwork, by bequest of Lizzie P. Bliss; a polychrome vase from Centuripe, a rare Scythian gold sword guard of the fifth century B.C., a Roman copy of a Greek head from the Lansdowne collection, and an exceptionally fine Greek gem, all welcome additions to the Classical Department. Among the accessions of the Department of Decorative Arts were a number of pieces of furniture, including eighteenth-century chairs, and a fine carved ebony cabinet of the period of Louis XIII. The Far and Near Eastern collections received, among other accessions, a Chinese memorial stele of the T'ang Period and ceramics and other objects from the Near East, including five stucco panels from

the frieze of a Sassanian palace at Nizanabad, of the sixth or seventh century, and two important reliefs of enameled tiles which once formed part of the decoration of the Processional Street of Babylon.

In February the Philadelphia Museum opened its new medieval section, containing much architectural material as well as sculpture, paintings, tapestries, stained glass, metalwork, furniture, and other medieval decorative arts. The centre of the wing contains the stonework from a Romanesque cloister, with columns and arches of pinkish marble. Around it are ranged an almoner's chapel, a Venetian Gothic room from the Palazzo Soranzo, a Florentine Gothic room, and a room from a fifteenth-century French château, with wainscoting and hooded fireplace. Another room contains painting and sculpture from the northern European countries, of the Gothic period. One of the outstanding architectural details is the façade of Saint Laurent l'Abbaye, thirteenth-century work, which dominates the great hall.

Among its accessions the Pennsylvania Museum received a capsula from the Guelph Treasure, a figure of Saint Sebastian by Pierre Puget, and, in the more modern vein, Renoir's notable portrait of Mme. Renoir. The Museum also opened, during the year, a branch museum housed in the 69th Street Arts and Crafts Community Centre.

The Boston Museum opened in February its newly arranged galleries of Italian Paintings and late Egyptian Art, and, in the fall, a room from the house of George Jaffery in Portsmouth, New Hampshire, to be used as the setting for a collection of silver made by Paul Revere and of portraits belonging to that famous silversmith or his family. Notable among these are a portrait by Copley showing Paul Revere at his work bench and two portraits by Gilbert Stuart of Paul Revere and his wife painted in their old age.

Among its accessions during the year the Boston Museum counts a rare portrait by Veronese of The Dead Christ Supported by Angels, 50 drawings by Sargent, three small terra cotta heads of Greek workmanship, a Central Asian head in stucco, a bust of Turgot by Houdon, several fine prints, including works by Dürer, the Master E.S., and Veit Stoss, 34 pieces of Early American silver, a Chinese scroll painting of the Sung Period, a long-lost pastel by Whistler, and Weymouth Bay, by Constable.

The City Art Museum of Saint Louis opened, in October, a series of five American period rooms, consisting of a main exhibition hall and four original interiors, one from 61 Tradd Street, Charleston, S. C., of the second quarter of the eighteenth century, one from 201 South Lee Street, Alexandria, Va., built about 1780; one from the Putnam-Hanson House in Salem, Mass., about 1800; and one from Newburyport, Mass., of about 1810. This museum opened in December a fine Gothic section, including four characteristic examples of architectural stonework and a beautiful sixteenth-century wooden staircase, with balconies, from the exterior of a house in Morlaix, Brittany.

Among the Saint Louis Museum's acquisitions during the year were five early American portraits—a Self-Portrait by Ralph Earle, Colonel Mendes I. Cohen by Rembrandt Peale, Mrs. Bergen by S. F. B. Morse, Mrs. William Steele by

Samuel L. Waldo, and Thomas Birch by John Neagle. Another interesting accession was a bust of Voltaire by Pigalle.

Two American Colonial period rooms were opened in the spring by the Minneapolis Institute of Arts. These Pre-Revolutionary interiors were brought from a house in Charleston, S. C. Among its accessions the Minneapolis Museum received a Greek grave stele of the fifth century B.C., and a Portrait of Lewis Warrenton, by Rembrandt Peale.

The collection of paintings, ceramics, and enamels belonging to the late Charles P. Taft became, upon the death of his widow in 1931, the property of the City of Cincinnati under the direction of the Cincinnati Museum, which owed its beginning to the Taft family. With the collection was left the Taft home and an endowment of \$1,000,000.

Similarly, upon the death of Mrs. Henry Clay Frick, the magnificent Frick Collection came into the hands of the City of New York. The collection is rich in the works of Rembrandt, Vermeer, Hals, and Holbein, as well as in other Dutch, Flemish, and German masters, and contains, also, fine examples of the work of Gentile Bellini, Veronese, Titian, and Veneziano, together with a number of eighteenth-century English paintings, including Lawrence's Lady Peale, a series of fine Fragonard paintings, formerly in the Morgan Collection, and bronzes and rare enamels. It probably would be opened to the public in 1932.

Late in the autumn the great collection of paintings, sculpture, porcelains, and other objects of art acquired by Henry Walters and his father passed, with Mr. Walters' death, to the city of Baltimore. It was not yet known whether this collection would be placed under the direction of the Baltimore Museum or administered separately.

The Brooklyn Museum acquired during 1931 a unique collection of Russian art, including icons, costumes, embroideries, and various types of decorative art. Among the acquisitions of the Fogg Museum were an ivory casket from the Guelph Treasure; paintings by El Greco, Murillo, Hals, and Rembrandt; a Portrait of M. de Caliasanne by Corneille de Lyon; a Portrait of a Woman attributed to Holbein; a Portrait of Dorothy Murray by Copley; and two interesting Chinese portraits of the Ming Period, as well as a number of Luristan bronzes. The Kansas City Museum acquired Rembrandt's Portrait of a Boy, formerly in the collection of Lord Leconfield; El Greco's Penitent Magdalen; Murillo's "Little Conception"; Veronese's Christ and the Centurion; David's Portrait of a Boy; Rubens' Portrait of Old Parr; and works by Hals, Gainsborough, Claude Lorraine, Corot and others; as well as several objects from the Guelph Treasure, a bronze by Giovanni Bologna, and a fourth-century Greek statue.

Among the acquisitions of the Detroit Institute of Arts were a dragon relief in glazed tiles which once formed part of the Ishtar Gate of Babylon; a Madonna and Child by Giovanni de Pisa; El Greco's Saint Francis in Ecstasy; a painting by Lurcat entitled "Yellow Silk," and several Egyptian reliefs of the Old Kingdom.

Among the acquisitions of the Art Institute of Chicago were a cross from the Guelph Treasure, several Luristan bronzes, a fine "Damascus" rug, an important collection of Rouen ware, a replica of Carl Milles' famous "Fountain of the

Tritons," which has been installed in McKimlock Court, and a number of paintings. The San Diego Art Gallery acquired a Penitent Magdalen by Murillo, a Holy Family by Rubens, and the Martyrdom of Christ by Bassano. A Virgin and Child by Filippino Lippi was among the outstanding acquisitions of the Toledo Museum; a fifteenth-century French polychrome statue, probably of Louis XI, in those of the Albright Art Gallery at Buffalo; and the Worcester Museum acquired its first example of Assyrian art, a slab of relief from the Palace of Assur-nazir-pal at Calah. The Carnegie Institute acquired, among other accessions, a painting by Arthur B. Davies—At the Chestnut Root—and Joseph Woodnell by Eakins. The Corcoran Gallery in Washington received four paintings by Davies from the collection of Miss Lizzie P. Bliss, and also acquired Bellows' well-known canvas, Forty-two Kids. The Brooklyn Museum, the Newark Museum, the Memorial Art Gallery of Rochester, the Saint Paul Art Association, the San Francisco Art Association, and the Rhode Island School of Design also received bequests from Miss Bliss, as well as the Metropolitan Museum already mentioned.

The Museum of Modern Art was, most fittingly, the chief beneficiary of the estate of Miss Bliss, whose collections were especially rich in modern paintings of the French school and works by Davies. Among its acquisitions from this bequest were a magnificent group of 21 Cézannes, a landscape by Renoir, two paintings by Degas, two Gauguins, three paintings by Derain, two by Picasso, and two by Matisse.

An outstanding event of the year was the opening in November of the Whitney Museum of American Art. This museum, on Eighth Street, New York, consists of three houses thrown together and has nine galleries on four levels. A small section is devoted to the earlier men and there are canvases by Eakins, Ryder, Blakelock, La Farge, Theodore Robinson, and Twachtman, but most of the emphasis is placed upon the moderns. The exhibition which opened the museum was to remain intact until the first of the year, 1932, when a second selection from the great collections was to be installed. There is a separate hall for sculpture, and other pieces are tucked away in hallways and available niches among the paintings.

EUROPEAN MUSEUMS. The fate of the artistic treasures of Spain was of great interest to art lovers during the year. The Spanish government was taking great precautions to guard them, and the Royal Palace at Madrid was established as a museum. The famous tapestries of the Cathedral at Zamora were made available for inspection in a near-by building, properly protected from danger.

One of the buildings of the French Colonial Exposition at Vincennes during the summer was to remain as a Museum of the Colonies. Leipzig opened, in February, a Museum of Chinese Art which had been in preparation for some time. It contains, among other collections, a dragon frieze from a Buddhist temple near Peking said to be the only one of its kind in any museum of the world. The Staatlichen Museen in Berlin opened in the Prinzessinpalais a museum showing various materials related to the well-known German architect, C. F. Schinkel, and reported, as well, a continual increase in visitors to the new wings opened in 1930, followed by gifts for further excavations at Pergamon. The Kaiser

Friedrich Museum, one of the component parts of the Staatlichen group, listed, among its acquisitions for 1931, two panels by an anonymous fifteenth-century German painter known as the "Hausbuch Meister," whose work is very rare. These two panels which represent the Last Supper and Maundy are characteristic of the medieval spirit and manner of representation.

The burning of the Munich Glaspalast on June 6 was a serious loss to German art. More than 3000 paintings and other works of art from about forty galleries and museums were assembled at the time. The loss is felt most severely in connection with the German Romantic School, of which a comparative exhibition was on display, but valuable works by Picasso, Chirico, and many other moderns were also destroyed.

The British Museum listed among its acquisitions a fine Sumerian statue, a small group of extremely rare and finely preserved woodcuts by Dürer and his school, and a valuable collection of Chinese porcelains. Among outstanding acquisitions of the Victoria and Albert Museum were the "Great Bed of Ware," one of the most famous pieces of Elizabethan furniture, mentioned by Shakespeare in *Twelfth Night*; the "Thomas à Becket" cup, sixteenth-century English work but traditionally associated with that saint because of initials which form part of its decoration; and a *Pieta* by Perugino. The Fitzwilliam Museum at Cambridge opened new quarters in which its collections may be seen to far better advantage than before.

The Luxembourg, from the limited fund set aside for the purchase of foreign work, acquired three paintings by Scottish artists, Peploe, Ferguson, and Leslie Hunter, which had been shown at the Exhibition of Scottish Painters at the Galerie Georges Petit in Paris. The Louvre added to its Persian collections two large marble reliefs from the palace at Persepolis, showing warriors of King Darius and a priest, as well as several fine examples of Egyptian sculpture and tomb furniture. An interesting phase of the work of the Louvre was called to public attention by the opening in October of the new scientific laboratory which offers greater facilities for the examination of works of art by photography and X-ray and for the study of their proper restoration.

**ART SALES.** The outstanding European sales of 1931 were undoubtedly the Nemes Sale at Munich in June and the Stroganoff Sale in Berlin in May. The Nemes sale, held under the combined auspices of F. Muller & Company, P. Cassirer, and H. Helbing, included such famous paintings as Rembrandt's *Fabius Maximus*, El Greco's *Concert of the Angels*, a fine Filippino Lippi *Virgin and Child*, a Fra Angelico *Adoration of the Magi*, Titian's *Federigo Gonzago*, Duke of Mantua, a version of his *Danaë*, and his *Venus with a Mirror*, together with fine examples of the slightly less famous Italian and northern painters and an outstanding collection of enamels, brocades, tapestries, and ecclesiastical vestments. Although its returns did not reach those of the Figdor and Spiridon Sales, the total amount received was 3,500,000 marks. Rembrandt's *Fabius Maximus* brought the highest price of any single object, 300,000 marks (about \$80,400). El Greco's *Concert of the Angels* sold for 275,000 marks (about \$66,000), and the Fra Angelico *Adoration of the Magi* for 100,000 marks (about \$24,000). The Titian *Danaë*

and *Venus with a Mirror* were reported to be unsold because the reserve was not obtained.

The Stroganoff Collection, founded by Count Alexander Stroganoff, a friend of Catherine II of Russia, included, besides representative paintings of various schools, fine furniture, sculpture, and bronzes. The outstanding price of the sale, which was held at Lepke's in Berlin, was given for two Vandykes, Balthasarine von Linick and Nicholas Rookox, which, together, brought 660,000 marks (about \$157,080). These portraits went to a Dutch dealer. The second highest price was that paid for Rembrandt's *Christ and the Samaritan Woman at the Well*, which was bought by the house of Goldschmidt in Berlin for 210,000 marks (about \$49,980). Romney's splendid portrait of Countess Woronzoff went for the comparatively low price of 50,000 marks (about \$11,900). The two fine Poussins, one of which was the well-known *Bacchanal*, were withdrawn because of the lowness of the offers. The total of the sale was 2,290,000 marks.

Other important European sales were the Goldschmidt-Rothschild sale in March, including French furniture, fine porcelains, textiles, and paintings; the Van Dirksen sale in April, which offered carpets, woodwork, sculpture, bronzes, ceramics, metalwork, and other objects of art; the Wendland sale of paintings, sculpture, furniture and decorative arts in April; and the "Herr H." sale in September, including such paintings as El Greco's *Jesus at the House of Simon* and works by Tintoretto, Velázquez, Cézanne, Degas, Daumier, and others. All these sales were held in Berlin.

An important Paris sale of the year was that of M. G. de Miré's collection of Negro and Mayan art, one of the most extensive ever made of this type of work.

Two items of unusual interest sold in London during 1931 were the so-called "Thomas à Becket" cup of ivory and silver gilt, the sole object of an entire sale at Christie's, which brought the Duke of Norfolk £11,000; and the "Canning jewel" attributed to Cellini, the property of Lord Harewood, which sold for £10,000. The cup found its way to the Victoria and Albert Museum, while the Canning jewel came into the hands of a private collector in America. The highest price paid for a painting in London during the season was £6825 for a *Portrait of a Child* by Romney.

In New York the "Collection of a Swiss Nobleman" sold at the American-Anderson Galleries for a total of \$211,490. This collection included paintings from the royal Hohenzollern and Hapsburg collections. Another sale of objects from dispersed European collections was that of furniture, glass, silver, china, tapestries, embroideries, and other objects of art from famous palaces of the former Russian Empire, sold at the Wallace Day Galleries for a total of \$69,136.

The other outstanding New York sales were chiefly concerned with American furniture and other Americana. The sale of the Frances P. Garvan Collection of early American furniture and other arts in January at the American-Anderson Galleries was one of the most important of these. The highest price at this sale was for a Chippendale mahogany highboy attributed to William Savery, which brought \$11,000. The total of the sales receipts was \$242,852. Other important sales of American work were those of the Israel Sack Collection of furniture and silver sold

at the American-Anderson Galleries for a total of \$90,550, the highest single price being given for a New Hampshire claw-and-ball foot highboy of about 1750, \$3000.

The King Hooper Collection of American furniture, silver, china, and other arts sold at the National Art Galleries for \$141,080, the highest price paid for a single piece being \$2300 for a curly maple block-front chest of drawers of about 1765. A sale of American furniture and woodwork from the Fleyderman Collection at the American-Anderson Galleries in April, including woodwork by Samuel McIntire from a room of the Putnam-Hanson House in Salem, brought \$86,320, the woodwork of the room selling for \$3300.

A sale of portraits by the Ehrich Galleries at the American-Anderson Galleries included the portrait of Lincoln by Carpenter, which sold for \$8500, and a portrait of Washington by Charles Willson Peale, which brought \$4300. Another item of Americana which aroused considerable interest was the discovery of a little-known Stuart portrait of Washington among the objects to be sold for the Estate of Chlanucey M. Depew at the Plaza Galleries, and its withdrawal from the sale by the executors. The sale of the Clark Collection of American portraits, which was heralded as one of the events of the year, was postponed.

**ASHMEAD-BARTLETT, ELLIS.** A British journalist, died in Lisbon, Portugal, May 4, 1931. Born in 1881, he was educated at Marlborough. His career as a war correspondent began in 1904 when he accompanied the Japanese Army during the Russo-Japanese War. He also accompanied the Spanish Army against the Riffs in Morocco in 1909 and the Italian Army in Tripoli in 1911, and was at the Turkish headquarters during the first Balkan War (1912) and at the Serbian headquarters during the second Balkan War (1913). During the World War he was selected by the British Press Association as its representative for the Dardanelles Expedition of 1915 and at Joffre's headquarters in 1916. Most of his correspondence following the War was for the London *Daily Telegraph*, his assignments taking him to India, China, Russia, and other countries. He was also a member of the House of Commons from 1924 to 1926, representing North Hammersmith as a Conservative. Among his publications are *Despatches from the Dardanelles* (1915); *Some of My Experiences in the Great War* (1918); *The Tragedy of Central Europe* (1923); *Uncensored Dardanelles* (1928); and *The Riddle of Russia* (1929).

**ASTRONOMY.** None of the mutually conflicting theories of stellar constitution and evolution that have been developed during the past twenty years is free from serious objections. On the basis of Eddington's theory, the capacity of stellar material as determined astronomically is of an altogether different order of magnitude

from that indicated by physics; in this theory, the perfect gas law is assumed to hold throughout a star, and the luminosity is uniquely determined by the mass. It is maintained by Jeans, however, that the major portion of the mass of a star must be liquid rather than gaseous, in order to give stability and to account for binary fission, and that mass and luminosity must be mutually independent—i.e. the observed mass-luminosity law is not deducible from fundamental physical laws alone, and must be an accidental circumstance that is brought about by the physical conditions that happen to exist in the stars; but Jeans is forced to postulate the presence of hypothetical chemical elements of high atomic weights as a source of stellar energy.

Still another theory of internal stellar structure has been developed by Milne, by a method which avoids the assumptions about the interior that were used by Eddington and by Jeans; Milne is led to the conclusion that a star of any given mass can in general adjust itself to suit any arbitrary rate of generation of energy, and thus may have any luminosity, but he finds that under existing conditions the stars will fall into two classes: One type consists of an exceedingly hot and dense core surrounded by an extensive gaseous envelope, and comprises ordinary giant and dwarf stars; the other type is of extreme density throughout, except for a thin outer shell, and comprises the white dwarfs. It is possible that a nova is caused by the passage of a star from the former to the latter condition, accompanied by a sudden decrease of the external radius and the release of a large amount of gravitational potential energy in the form of radiation as the gaseous envelope collapses onto the dense core.

On Milne's theory, the central temperatures of stars may amount to ten or a hundred billion degrees, and this is ample to account for the conversion of matter into energy without postulating new elements of high atomic weight; but the discrepancy between the physical and the astronomical values of the opacity is far greater on Milne's theory than on Eddington's theory. Menzel has suggested that the difficulty about the opacity may be overcome by assuming a star to be composed almost entirely of hydrogen; while Jeffreys suggests that the discrepancy may be an indication that the chief mode of transfer of energy within a star is by vertical convection currents instead of by radiation and absorption. However, it has recently been found that according to the quantum theory the opacity of a gas which is in the condition of that in the white dwarfs is probably very low; and as a result, the central temperatures of these stars may be as small as 15,000,000 degrees.

Milne's investigations have stimulated a large amount of work on the problem by others. It appears, however, that no conclusive theory of stellar constitution is at present possible; the principal difficulty lies in our ignorance of the law of generation of energy: The source of stellar energy is one of the outstanding problems of astrophysics, and we seem to be as far as ever from a final solution of this problem. There are three main processes which must be considered, viz. the annihilation of electrons and protons, the synthesis of helium, and the building up of complex elements. Until recently,

it has not been possible to calculate the rate at which any of these processes might take place, but modern quantum mechanics has now made it possible to attempt such calculations; the results, however, are not promising: The rate of annihilation as calculated by Dirac is inconsistent with the known stability of matter; and A. H. Wilson has found that a building up of complex elements at a reasonably rapid rate would require a temperature of ten or a hundred billion degrees, which only Milne's theory provides.

Milne's theory of stellar atmospheres also has been questioned by Menzel, who maintains that the chromosphere cannot be supported by radiation pressure alone.

**EXTRAGALACTIC SYSTEMS.** The displacements of lines toward the red in the spectra of forty-six extragalactic nebulae as obtained at Mount Wilson have, with only one exception, confirmed the relation between distance and apparent radial velocity found by Hubble in 1929, and have extended this relation to a distance of 105,000,000 light years; to within an accuracy of 10 per cent, these distant systems exhibit an apparent velocity of recession of 558 kilometers per second for each million parsecs distance. The greatest displacement yet found is in the spectrum of one of the members of a cluster of nebulae in Leo, for which the apparent velocity of recession is 12,000 miles per second. The interpretation of these spectral shifts is still problematical, although several authorities maintain that they represent an actual expansion of the universe.

It has been suggested that the light from the distant extragalactic systems may have a velocity different from that of light from nearby objects; but by comparing the aberration for nearby stars with that for the Ursa Major nebula, which lie at a distance of 70,000,000 light years, Strömberg has shown that the velocities of the light from the two are the same to within at least one tenth of a per cent.

**NEBULÆ.** A redetermination of the distance of the Orion nebula by Trumpler has given the value 1800 light years, which is about three times as large as the previously accepted figure. The stars in the nebula were photographed through color filters which cut out most of the nebular light, and the distance of the cluster was then determined by the method previously developed by Trumpler for galactic clusters; the result was checked by two other methods. The diameter of the nebula is 26 light years. Hopfield has succeeded in producing nebulium lines in the laboratory for the first time.

**STARS.** The general grouping of the stars into giants, dwarfs, and white dwarfs is well known; within these groups, however, a number of sub-groups exist, and methods for detecting the latter have been devised by Strömberg, who has used for this purpose the parallactic and peculiar reduced proper motions and the radial velocities. The distribution of absolute magnitudes as thus determined for stars of spectral types KO to K2 brighter than the sixth apparent magnitude, e.g., shows four distinct groups, while among types K3 to K9 three groups are revealed.

The principle that the period of variation of a Cepheid variable gives a measure of the absolute magnitude, and hence of the distance, of the star, has been very widely used in es-

timating distances of globular clusters and spiral nebulae. The calibration of this scale of absolute magnitude, however, requires the independent determination of the distances of some of the Cepheids, and this is a difficult task because they all are too far away for accurate trigonometric parallaxes to be obtained. Originally the distances were estimated from proper motions, and were admittedly uncertain; considerable improvement has been effected by subsequent investigations, and although still further corrections may be found necessary it is now quite improbable that anything like the reduction to one-tenth the original estimates, that was at first favored by Curtis, Kapteyn, and Van Rhijn, is possible; Shapley has adopted a correction which decreases his original distances by 11 per cent, but a redetermination of proper motions by Gerasimović, together with a study of the radial velocities, indicates that the correction needed may possibly be as much as 30 or 35 per cent.

On the other hand, we have every reason to believe that the galaxy is completely analogous to the typical spiral nebulae; and yet the distances of the globular clusters given by the Cepheid variables therein indicate dimensions for the galactic system that are several times as great as those of the nearer spirals. Seares has concluded, however, that the light from these variables is greatly dimmed by clouds of obscuring nebulosity in the galaxy, and that the estimated brightness and distances are therefore much too great, so that in reality the galaxy is of quite ordinary size. From counts of extragalactic nebulae in different parts of the sky, Hubble infers that partial obscuration extends to galactic latitude  $40^\circ$  in the direction of the galactic centre.

The nature of the so-called Wolf-Rayet stars, viz. those which show broad atomic emission bands in their spectra, has long been an enigma. These stars are confined to spectral types O and early B; their spectra have many similarities to the spectra of novæ, and some novæ have been seen apparently to change into Wolf-Rayet stars. From an extensive study of these stars, Beals has concluded that probably the emission lines come from gaseous material that is being continuously ejected in a radial direction with high velocity by selective radiation pressure; the broadening of the lines is the result of a Doppler effect. Beals shows that not enough mass would be lost by such a process to invalidate his theory.

McLaughlin has suggested that the BE stars, the spectra of which show bright lines divided by dark lines into two portions that continually change in intensity, are stars with very extensive atmospheres; the bright line is produced in the inner atmosphere, while the dark line is caused by absorption in the outer atmosphere; these stars periodically explode every few months or every few years—the gases are blown away from the star by radiation pressure, and later fall back.

Another explanation has been suggested by Struve, however: He finds that the B stars which have widely separated double bright lines are characterized by extremely flat and broad absorption lines that are now known to indicate rapid axial rotation; but the stars in which the emission lines are single, narrow, and few in number, show little evidence of rotation.

Hence the B stars which show bright lines may be rapidly rotating, unstable, lens-shaped bodies, surrounded by a revolving nebulous ring that is formed from material ejected at the equator the width of the emission lines would depend on the inclination of the axis of rotation to the line of sight.

The investigation of stellar rotations by means of the contours of spectral lines has shown that rapid rotation, although by no means so rare as formerly supposed, is peculiar to the earliest spectral types. The equatorial speed of rotation on the sun is only four kilometers per second; in the case of both Eta Ursæ Majoris and the brighter component of the binary Alpha Virginis, it is two hundred kilometers per second, which is not much below the critical speed at which the Maclaurin ellipsoids of rotation become unstable. Hence in the earliest spectral types, a transition may exist between spectroscopic binaries and rapidly rotating single stars, but the direction in which such a transition may take place is not indicated by the observational facts; there are several objections to the fission theory of binaries. However, a distinct correlation between the periods of orbital revolution and axial rotation has been found in the case of spectroscopic binaries; this correlation disappears with increasing eccentricity, and favors the fission theory. The periods of variation of Cepheids and of long period M variables are also related to the period of axial rotation.

H. Van Gent, of the Leyden Observatory, discovered a variable star in Puppis with a period of only 100.4 minutes; the magnitude ranges from 14 to 15.

SUN. Lyot, of the Meudon Observatory, has partially solved the long-standing problem of the observation of the solar corona without a total eclipse: In the extraordinarily pure summer atmosphere of the Pic du Midi, at an elevation of 9439 feet, he found the diffraction and scattering by the air to be so reduced that he could observe the prominences without a spectroscope, merely by interposing in the optical train a metal disk slightly larger than the image of the sun formed by an objective four centimeters in diameter. With a direct vision spectroscope, two of the bright coronal lines were visible; and it is possible that spectroheliograms of the corona could be secured. Furthermore, with a highly sensitive polariscope, an exploration of the sky near the sun resulted in the detection of the inner corona by means of the polarization of its light; the form of the corona could be traced out in this way.

A new calculation, by Hopfield, of the wave lengths of the metastable lines of oxygen, from recent and more accurate values of the wave lengths of the principal oxygen lines, has given one which seems to be identical with the hitherto unidentified coronal line. A study of the solar prominences has led Pettit to conclude that local electrical fields on the sun are responsible for the forces which cause their characteristic forms.

That sunspots are cooler than the rest of the solar surface has long been established; Pettit and Nicholson at Mount Wilson, with a large image of the sun and a delicate thermocouple, find the total heat radiation from a spot to be only 40 per cent of that from an equal area of the disk; the spot temperature is  $4760^{\circ}$  Abs., or  $1200^{\circ}$  less than the temperature of the disk.

Sunspots are known to be vortices, in which the motions are upward and outward; expansion of the rising material causes cooling, and the vertical temperature gradient in the sun is such that this cooling by expansion exceeds the upward rate of decrease of temperature in the surrounding solar atmosphere. On Milne's theory of the solar atmosphere, an ascent of 30 miles would more than account for the observed relative cooling, but the spots, because of their immense size, certainly must go much deeper than this. However, Unsöld has shown that at a depth of 1000 miles within the sun, where the temperature is  $15,000^{\circ}$ , hydrogen is almost entirely ionized; the recombination of the ions during an ascent liberates enough heat to keep the ascending current going; this source of heat ceases a little below the photosphere, but the ascending column is forced on upward by its momentum, cooling by expansion. Thus the spots are cool only near the surface; deeper down, they are relatively hot.

PLANETS AND SATELLITES. Pluto has been found on two plates taken at the Lowell Observatory in 1915; eleven predisccovery images are now known.

While as many as 100,000 minor planets may exist, their total mass probably is not over 1/1000 that of the earth. Hirayama has shown that they may be grouped into families, the members of each family undoubtedly being of common origin. The fluctuations in brightness show these bodies to be irregular fragments. They could not have been formed in the same way as the other planets, because their masses are too small for them to have condensed from a gas. Neither is an explosion theory tenable: No satisfactory reason can be given for the occurrence of an explosion; furthermore the explosion would have had to be feeble, else the fragments would not have followed nearly the same orbit as the parent body, yet a feeble explosion could not have produced a disruption into so many fragments; again, several successive explosions would be needed to account for the families; and finally, most of the parent body must have been removed from the solar system without leaving a trace. Now, minor planets are in many respects analogous to comets, especially in regard to orbital elements; sometimes it is uncertain whether a newly discovered object is a comet or a minor planet, and several objects are now known which could be classified as either.

The continuous spectra of comets when near the sun are due to reflected solar light, and are similar to the spectra of the minor planets. Comets are known to lose their gaseous envelopes, and disintegrate into swarms of meteors. Bobrovnikoff therefore suggests that the minor planets are the disintegration products of comets, or perhaps of a single large comet after capture by Jupiter. Some comets have masses comparable to the total mass of the minor planets—e.g. Donati, and 1882 II. A disintegration in successive stages, as illustrated by the comet groups that have originated from one body, would explain the Hirayama families.

ASTRONOMICAL PHENOMENA. The minor planet Eros came to opposition on February 17, only a month after passing perihelion; hence it approached the earth nearly as closely as it ever can. The closest approach was on January 30, to within about 16,000,000 miles; and advantage

was taken of the circumstance to redetermine the solar parallax and the mass of the moon. Comparison stars had been under observation since 1925. The perturbations of Eros when near the earth give an accurate value of the combined mass of the earth and the moon. Furthermore, the motion of the earth around the centre of gravity of the earth and the moon produces an apparent motion of Eros with a period equal to that of the revolution of the moon, which if carefully determined over several lunations gives as reliable a measure of the solar parallax as does the direct trigonometric determination at the time of closest approach. For a trigonometric determination, either the diurnal parallax of Eros at a single station, or the geocentric parallax between distant stations, may be used. The opposition of 1938 will be inferior to that of 1931, though better than in 1901; that of 1968 will be about the same as in 1938; the next really favorable oppositions are in 1975 and 2012.

Eros was more than a magnitude fainter in October and September, 1930, than had been expected. The brightness periodically varied by 1.02 magnitudes during December; during January the range of variation rapidly decreased to half a magnitude, while the period remained unchanged. The period of axial rotation is 5h. 16m. 13s., according to L. Campbell; the variability in brightness is due to unequal reflection from different parts of the surface, and the fluctuations in the amount of this variability are probably due to changes in the relative positions of the sun, the earth, and Eros.

Four comets appeared, including the 38th observed return of Encke, and a return of 1913 III (c) Neujmin, one of the two members of Saturn's family to be observed more than once.

Comet 1930 (b) Beyer was observed for 617 days. Comet 1925 II Schwassmann-Wachmann I, discovered in 1927, remained visible during 1931, although it passed perihelion six years ago, and is now over seven astronomical units from the sun; in February, it suddenly increased a hundredfold in brightness for a few days; a similar short outburst occurred in December, 1929. This comet was identified with a hitherto undiscovered comet found on four plates taken in 1902; since it was then near aphelion, it must have been photographed during one of its peculiar outbursts, the cause of which is unknown. The orbit is nearly circular, lying between Jupiter and Saturn. This comet is the first one to be observed all the way around its orbit. Stearn's comet, under observation for four years, was followed to over 12 astronomical units from the sun, a record.

The most brilliant shower of Leonids that has been seen since 1866 occurred; the greatest display took place early on the morning of November 17. This gives an increased hope that in 1932 or 1933 a shower rivaling that of 1833 may occur.

A group of 13 craters caused by meteoric impact, similar to the famous one in Arizona, was found in Australia; the largest is an oval 220 by 120 yards.

MISCELLANEOUS. The 69-inch mirror for the Perkins Observatory of Ohio Wesleyan University was completed. This mirror has been made entirely in the United States; the glass was cast at the Bureau of Standards, and the mirror was figured by the J. W. Fecker Co., in Pitts-

burgh. Three years were required for the figuring, which took a total of nearly 16,000 hours of work.

The plates taken by the Potsdam solar eclipse expedition in May, 1929, to test the gravitational deflection of light, have been discussed by Freundlich. The displacements of the star images are due to both the relativity deflection and the effect of small variations in the focal length of the observing telescope; a correction for the latter leaves 2".24 for the gravitational deflection, instead of the theoretical value of 1".75. Moreover, a recalculation of the results obtained by the Lick Observatory, in which this correction is applied, gives 2".2.

NECROLOGY. Solon Irving Bailey, June 5; W. F. Denning, June 9; Edward S. King, September 11 (q.v.).

ATHLETICS, TRACK AND FIELD. The track season of 1931 developed into a demonstration by United States athletes that they would be ready to defend their laurels in the summer of 1932 when the Olympic games were to be staged at Los Angeles. New world's records were set. Other American records were shattered, reshattered, and stellar performances in almost every event studded both the outdoor and indoor seasons. Percy Morris Beard, of Greensboro, Ala., representing the New York Athletic Club, George Spitz, a New York University freshman, Frank Wyckoff, the University of Southern California sprinter, Paavo Nurmi, of Finland, who has been setting records for a decade, and Jules Ladoumègue of France were probably the outstanding performers of the year.

Beard, an engineering instructor at Alabama Polytechnic Institute, an unknown, sprang into prominence in the indoor campaign, and then put the finishing touches on one of the greatest individual performances on record by breaking the 11-year-old 120-yard world's high hurdles mark of Earl Thomson's on the cinders at Lincoln, Nebraska in July. Beard's time was 14½ seconds. Spitz, former Flushing High School student, jumping against a group of stars, including Anton Burg, indoor and outdoor national champion, and Harold Osborn, outdoor record holder, leaped 6 feet 7 inches in the running high jump at the Millrose games in New York City to break the world's record for the event. It was the most noteworthy feat of the entire indoor season.

Frank Wyckoff, did the 100 yards at the National Championships at Lincoln, Nebraska, in 9½ seconds, and also won the Intercollegiate hundred in the meet at Franklin Field, Philadelphia, in May. Wyckoff was unbeaten in the sprints

throughout the year and in the year before the Olympics gave warning that he would be a dangerous foe for Percy Williams, Olympic champion, at Los Angeles in August, 1932. Paavo Nurmi, his shorter distance days behind him, was again a perfect performer in 1931. This runner ran 2 miles in 8:59%, lowering the outdoor record of 9:01%. The new outdoor mark does not approach Nurmi's remarkable indoor mark set in New York in 1926 of 8:58%, a mark that was considered unbeatable by all experts.

Ladoumègue, the handsome Parisian, attacked Nurmi's mile record successfully after many trials. In a record trial in Colombes Stadium, the Frenchman eclipsed Nurmi's six-year-old, 4:10% record by 1% seconds when he did the distance in 4:09%. Ladoumègue had been considered the premier 1500-meter runner of the world for three years. There were several other world records by Americans in this pre-Olympic year. Ben Eastman, Stanford University sophomore, equaled Ted Meredith's grand record of 47% seconds for the quarter mile in beating Vic Williams of Southern California on the Pacific Coast, and Williams in the Intercollegiate A.A.A.A. championships at Philadelphia also duplicated those figures with a dynamic charge down the stretch that carried him past Eastman. The United States also maintained its relay traditions by bettering both the indoor and outdoor world's record for the mile. In the Indoor intercollegiates in March in New York City, the University of Pennsylvania quartet went over the distance in 3:17%, beating the old mark of 3:20%, set by Harvard in 1930. In May on the Pacific Coast a Stanford four—Maynor Stove, Alvin and Les Hables and Ben Eastman—ran the mile outdoors in 3:12%, eclipsing the record set by a picked Olympic four in 1928 of 3:13%.

Japan's warning that the East would make a real assault on the Olympics was forecast when Chuhei Nambu, who was placed fourth in the hop, step, and jump, in the 1928 Olympics at Amsterdam, broad jumped 26 feet 2½ inches for a new world's record at Tokio.

Other star performers whose feats were notable in 1931 were Carl Coan, University of Pennsylvania mile runner, Joe McCluskey, Fordham University two miler and steeplechaser, Eddie Tolan, Michigan University negro sprinter, Russell Chapman, Bates College half miler, Gus Moore, two miler, Bernard Gridley and Victor Burke, hurdlers, Herman Brix, shotputter, Emmett Topolino, Loyola University of Chicago, sprinter, Kenneth Church, javelin thrower, Levi Casey, hop, step, and jump champion, Jess Mortensen, Los Angeles A. C., decathlon performer, and Norwood Wright, hammer thrower.

**AUSTRALIA, COMMONWEALTH OF.** A self-governing dominion of the British Empire, consisting of the six original States (formerly colonies) of New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania, together with the Northern Territory and the Federal Territory, and comprising the island continent of Australia with its dependencies. Capital, Canberra.

**AREA AND POPULATION.** With an area of 2,974,581 miles, Australia had an estimated popula-

tion on Mar. 31, 1931, of 6,488,707, as compared with 6,429,207 a year earlier. The area of the several states, with the respective populations on March 31 in 1931 and 1930, is shown in the accompanying table compiled from estimates of the Commonwealth Statistician.

AREA AND POPULATION OF AUSTRALIA

States and Territories	Area in square miles	Population Mar. 31, 1931	Population Mar. 31, 1930
New South Wales ..	309,432	2,504,536	2,488,645
Victoria .....	87,884	1,795,522	1,783,649
Queensland .....	670,500	952,483	934,643
South Australia ..	380,070	582,928	580,249
Western Australia ..	975,920	420,124	417,423
Tasmania .....	26,215	219,694	215,969
Northern Territory	523,620	4,613	4,584
Federal Capital Territory .....	940	8,807	9,045
Total .....	2,974,581	6,488,707	6,429,207

The excess of births over deaths in the calendar year 1930 was 73,068, as against 68,623 in 1929 and 74,700 in 1928. However, 11,408 more persons left Australia during the year than the number arriving from overseas, whereas in 1929 immigrants outnumbered emigrants by 8963. The total estimated increase of population in 1930 accordingly was but 61,000, compared with 77,586 in 1929 and 101,932 in 1928. With slight variations, the birth rate has shown a steady decline from 42 per 1000 inhabitants in 1860 to 19.93 per 1000 in 1930; the death rate slumped from 21 per 1000 in 1860 to 8.59 per 1000 in 1930. Marriages in 1930 numbered 43,255 (47,501 in 1929). The estimated population of the state capitals on Jan. 1, 1931, with figures for Jan. 1, 1930, in parentheses, was: Sydney, New South Wales, 2,504,536 (2,483,645); Melbourne, Victoria, 1,795,522 (1,783,649); Brisbane, Queensland, 313,251 (318,631); Adelaide, South Australia, 324,420 (324,898); Perth, Western Australia, 204,780 (202,888); Hobart, Tasmania, 57,800 on Mar. 31, 1931 (57,500 in 1930). The population of Canberra, the Federal capital, on June 30, 1930, was 7290 (6878 on June 30, 1929). Almost half of the total population was concentrated in these seven capital cities, which include the largest municipalities.

**EDUCATION.** Primary education is free and compulsory throughout the Commonwealth and state aid is extended to the higher state schools, the secondary schools, and the universities. In 1930, there were 10,263 state schools, with 32,391 teachers and an enrollment of 929,299 pupils, the average attendance being 777,626. Private schools, most of them parochial institutions, numbered 1779, with 237,713 pupils in 1928; the average attendance was 184,464. There are six state universities—one at each of the state capitals—with a total of 7988 matriculated and non-matriculated students in 1928. For details of education in the respective states and territories, consult the individual articles.

**PRODUCTION.** Australia is primarily an agricultural and pastoral country, despite the concentration of population in the large cities and efforts to foster manufacturing. Of the total area, roughly equivalent to that of the United States, only 6.21 per cent, or 118,252,152 acres, had been actually alienated by 1928; 3.36 per cent, or 63,959,383 acres, were in process of alienation; and 50.1 per cent, or 953,689,982 acres, were held under various forms of leases

and licenses. The estimated value of all production in 1929-30 was £391,490,000, as compared with £447,863,000 in 1928-29 and £454,108,000 in 1924-25. The value of production by principal industries in 1927-28, 1928-29, and 1929-30 is shown in the accompanying table from the *Quarterly Summary of Australian Statistics*.

VALUE OF AUSTRALIAN PRODUCTION, YEARS  
ENDED JUNE 30

[In thousands of pounds sterling]

Item	1928	1929	1930
Agricultural .....	£ 84,328	£ 89,440	£ 77,109
Pastoral .....	124,554	116,733	86,483
Dairy, poultry, bee farming .....	50,261	50,717	49,898
Forestry and fisheries	12,181	11,617	11,371
Mining .....	22,983	19,597	17,945
Manufacturing* .....	158,562	159,759	149,184
Total .....	452,869	447,863	391,490

\* Value added in process of manufacture.

The decline in the value of production in 1929-30, particularly in agricultural and pastoral output, was due to the sharp drop in farm prices and to other effects of the world-wide depression. The declines continued throughout 1930-31. The net profits of 28 of the largest companies operating in the Commonwealth declined from £2,071,000 in 1929 to £794,000 for 1930—a decline from 11 to 4 per cent in net profits on capital invested before making allowances for reserves. The estimated national income dropped from £650,000,000 in 1927-28 to £564,000,000 in 1929-30 and £485,000,000 in 1930-31. Of the total income, wages and salaries amounted to £363,000,000 in the calendar year 1928, £367,000,000 in 1929, and £341,000,000 in 1930. The income of shopkeepers, farmers, etc., was £126,000,000, £128,000,000, and £118,000,000, respectively; and other incomes, £162,000,000, £150,000,000, and £139,000,000, respectively. The decline in income was partially offset by the fall in the cost of living. Lower living costs for the quarter ended June 30, 1931, caused the Federal Arbitration Board to reduce the weekly basic wage as of August 1, the reductions ranging from 3 shillings (about \$0.73) at Melbourne to 6 pence (about \$0.12) at Brisbane.

The principal crop is wheat, to which 18,213,426 acres, or more than 70 per cent of the total cultivated acreage, were devoted in 1930-31. The 1930-31 crop of 212,628,669 bushels (final estimate) established a record for Australia. The previous record production of 179,065,703 bushels was harvested in 1915-16. Production of the chief crops in 1929-30 was: Wheat, 126,884,622 bushels; oats, 14,424,186 bushels; maize, 7,946,430 bushels; hay, 2,725,244 tons; sugar cane, 3,755,375 tons. The estimated production of cane sugar for the calendar year 1930 was 532,477 tons. Other crops are potatoes and other vegetables, grapes, apples (over 9,500,000 bushels in 1929-30), oranges, bananas, apricots, peaches, pears, raisins, currants, and other small fruits. The wine production in 1928-29 was 18,600,249 gallons. Livestock in 1929 included 104,558,342 sheep, 11,202,134 cattle, 1,845,614 horses, and 1,018,324 swine. In 1931 the sheep population rose to 106,400,000, the highest since 1891. Wool production, as in the grease, in 1929-30 amounted to 937,596,816 lbs. (968,152,935 lbs. in 1928-29). Frozen beef, mutton, and lamb is exported in large quantities. In 1929-30, the output of butter was 299,080,545 lbs., cheese 30,173,020 lbs., bacon

and ham, 70,101,981 lbs. The final estimate for the 1931-32 wheat crop totaled 170,011,000 bushels.

Mineral production for the calendar year 1929 was as follows: Gold, £1,814,457 (£1,981,972 in 1930); silver and lead, £3,293,863; copper, £1,075,146; tin, £459,686; coal, £8,676,324; all minerals, £17,944,625 (£19,596,634 in 1928). There were 22,700 manufacturing establishments in 1929-30, with 419,194 employees, who drew salaries and wages of £84,717,033. This contrasted with 22,918 establishments, 450,482 employees, and £90,986,908 paid in salaries and wages in the previous year. The principal articles manufactured are foods and drinks, metal products and machinery, clothing and textile fabrics, books, paper, wood products, stone, clay, and glass articles, and vehicles and harness. Statistics of production, etc., for the several states are given in articles on each. In the second quarter of 1931, more than a quarter of a million workers were unemployed, including 118,424 trade unionists, or 27.6 per cent of the total trade union membership.

COMMERCE. Australia's total trade for the fiscal year ended June 30, 1931, declined to £149,369,095 from the previous year's total of £256,208,408. However, a favorable balance of trade of £41,380,303 was recorded, as compared with an excess of imports of £5,954,172 during 1929-30. If adjustment is made for the abnormal rate of exchange prevailing during the year, the excess of exports was about £36,000,000 in Australian and £28,300,000 in British currency. In Australian currency, exports in 1930-31 totaled £102,038,398, or £23,088,750 less than in 1929-30, while imports were approximately £68,200,000. Of the exports, £12,273,562 represented gold shipments, which were £14,594,977 below the 1929-30 figure, and merchandise and silver shipments were valued at £89,704,836, or £8,493,773 less than in the previous year. The value of exports in sterling values was estimated at £88,800,000. Imports, expressed in British currency, totaled £60,558,095—a decrease of £70,523,335, or 54 per cent. Merchandise represented £60,159,042 of the total imports, and specie and bullion, £399,053. Australia's overseas trade, by states, for 1929-30 and 1930-31 is shown in the accompanying table. The values are expressed in Australian currency without adjustment for its depreciation.

AUSTRALIAN FOREIGN TRADE, BY STATES

State	1929-30	1930-31	Decrease
IMPORTS			
New South Wales	£57,127,427	£25,897,460	£31,229,967
Victoria .....	42,301,093	20,310,352	21,990,741
Queensland .....	11,540,083	5,567,817	5,972,266
South Australia ..	9,360,275	3,911,596	5,448,679
Western Australia	8,879,010	4,061,255	4,817,755
Tasmania .....	1,834,530	790,902	1,043,628
Northern Territory	38,902	16,713	22,189
Total .....	131,081,820	60,558,095	70,523,225
EXPORTS			
New South Wales	35,761,807	31,480,985	4,280,822
Victoria .....	36,499,943	25,854,785	10,645,158
Queensland .....	18,821,824	16,754,567	2,067,257
South Australia ..	15,009,496	10,087,986	4,921,510
Western Australia	16,004,694	15,543,178	461,516
Tasmania .....	2,970,913	2,317,472	653,441
Northern Territory	58,471	19,425	39,046
Total .....	125,127,148	102,038,398	23,088,750

The Commonwealth's foreign trade showed a steady decline after 1926-27, when imports

amounted to £164,716,594 and exports to £144,084,597. Imports declined more sharply than exports, gradually reversing the heavy unfavorable balance of trade. The most noticeable import decreases for 1930-31 were recorded for motor cars, iron and steel, piece goods, machinery,

Australian states, before and after the adjustments made under the so-called Copland or Melbourne economy plan of 1931, are shown in the accompanying table reprinted in *Foreign Policy Reports*, Sept. 16, 1931, from *The Argus* (Melbourne), of July 11, 1931.

STATE BUDGETS FOR 1931-32 BEFORE AND AFTER THE JUNE, 1931, AGREEMENT

	New South Wales	Victoria	South Australia	Queensland	Western Australia	Tasmania
<i>Original estimate</i>						
(a) Expenditure .....	£59,560,000	£26,500,000	£13,090,000	£16,240,000	£9,930,000	£2,900,000
(b) Revenue .....	48,050,000	28,440,000	10,690,000	14,610,000	8,070,000	2,680,000
(c) Deficit .....	11,510,000	8,060,000	2,400,000	1,630,000	1,860,000	220,000
<i>Adjustments under Copland Plan</i>						
(d) Reduction in (a) ....	4,600,000	1,750,000	900,000	870,000	660,000	130,000
(e) Additions to (b) ....	1,500,000	.....	.....	.....	.....	.....
(f) Reduced deficit .....	5,410,000	1,310,000	1,500,000	760,000	1,200,000	90,000

timber, petrol (gasoline), apparel, yarns, tea, and spirits. Exports of butter, wheat, dried fruits, cheese, eggs, and coal increased, as compared with 1929-30, while exports of wool, hides and skins, flour, lead, meats, sugar, fresh fruits, and copra declined. The five leading exports in order of value in 1930-31 were wool, wheat, gold, butter, and flour; the five leading imports were cotton and linen piece goods, petroleum, machinery (excluding electrical), silk piece goods, and electrical machinery. The United States in 1930-31 furnished about 19 per cent of Australia's imports, as compared with 24.6 per cent in 1928-29.

**FINANCE.** The Commonwealth budget for the fiscal year ended June 30, 1931, showed a deficit of £10,757,619, the total receipts of the Consolidated Revenue Fund amounting to £69,566,920 and the total expenditures from revenue to £80,324,539. This compared with revenue receipts of £77,143,389 and expenditures of £78,614,393 in 1929-30. In addition to the 1930-31 deficit, there was an accumulated deficit of £6,458,723 on operations of previous years and £3,834,149 (net) expended to meet interest payments on the New South Wales debt defaulted by that state, bringing the total Commonwealth deficit to £21,050,491. The Commonwealth Treasurer, in his budget speech of July 10, 1931, said that loan authority was available to meet £7,000,000 of this deficit, but that further loan appropriations would be necessary to cover the remaining £14,000,000.

Loan expenditure during 1930-31, not included in the above totals, amounted to £1,988,820, as against £4,127,000 in the previous year. The Commonwealth applied £4,644,359 to debt redemption, while the amount made available from the national debt sinking fund for the redemption of state debts amounted to £3,514,509.

For 1931-32, the Treasurer in his budget speech of July 10, 1931, estimated Commonwealth expenditures at £59,311,300 and revenues at £54,135,000, leaving a deficit of £5,176,300. The suspension of payments on the war debt to Great Britain was calculated to reduce the deficit by £4,028,000, leaving a final deficit for 1931-32 of £1,148,300. The budget was based on a programme calling for economies totaling £8,155,000 in addition to those inaugurated in 1930 and for additional tax revenue of £1,500,000. The conversion of the internal debt to a lower rate of interest was expected to save £2,470,000 net. For further details of the 1931-32 budget, see below under *History*. The budgets of the six

The gross Commonwealth debt increased by £15,761,183 during 1930-31 to £388,718,545, of which about £212,000,000 was held in Australia, £157,400,000 in London, and £17,100,000 in New York. The London debt included the war debt owing to Great Britain, which totaled £79,924,221 on June 30, 1931. The net Commonwealth debt amounted to about £366,700,000, compared with £349,700,000 a year earlier. The combined debt of the six states increased by £39,676,536 during 1930-31 to a total of £767,316,372.

**COMMUNICATIONS.** Federal and state railway systems had 26,605 miles of line in operation in 1929-30, divided as follows: Commonwealth, 2145; New South Wales, 5974; Victoria, 4713; Queensland, 6447; South Australia, 2536; West Australia, 4111; and Tasmania, 679. For the year ended June 30, 1931, the railways reported an aggregate operating profit of £8,268,348. Taking into account interest on railway loan funds, there was a deficit for 1929-30 of £8,491,639, divided as follows: New South Wales, £2,756,374; Victoria, £1,021,270; Queensland, £1,559,931; South Australia, £1,796,228; Western Australia, £404,480; Tasmania, £312,411; and the Commonwealth Railways, £640,936. The cumulative railway deficit for the five years ended June 30, 1930, totaled more than £30,000,000 (about \$150,000,000).

Highways in 1930 extended 329,662 miles, of which 6500 miles were macadam, 127,623 miles were improved in various other ways, and 105,539 miles were unimproved earth. For Federal-aid road bill of 1931, see under *History*. Civil aviation operations declined somewhat in 1930-31 due to the economic depression. On June 30, 1931, there were 231 registered aircraft, 407 private and 205 commercial registered pilots, and 54 government and 59 public aerodromes. The first air-mail from England reached Darwin, North Australia, on Apr. 25, 1931. During the year, the Melbourne-Tasmania air service was increased from tri-weekly to daily, but failure to secure a government subsidy forced the suspension of the Sydney-Brisbane and Sydney-Melbourne services. The year was marked by the inauguration of direct telephone service between Perth and Brisbane.

**ARMY AND NAVY.** See **MILITARY PROGRESS**; **NAVAL PROGRESS**.

**GOVERNMENT.** The executive power is vested in the King, who acts through a governor-general, assisted by an executive council of responsible ministers, who must be members of the Federal Parliament, comprising the Senate and House of

Representatives. The Senate consists of at least six members from each of the original states, elected for six years, half of whom are renewed every three years; while the House of Representatives consists of approximately twice as many members as there are senators, the representation being apportioned among the several states according to the population shown at the last census. The number in the House in 1931 was 75 and in the Senate, 36. The composition of the House following the election of Oct. 12, 1929, was: Labor, 46; Nationalist, 14; Country party, 10; Independents, 5. Governor-General in 1931, Sir Isaac Isaacs, appointed Dec. 2, 1930. The Labor Ministry, formed Oct. 22, 1929, and reconstituted in February, 1931, was as follows: Prime Minister, Minister for External Affairs, and Industry, J. H. Scullin; Treasurer, E. G. Theodore; Vice President of the Executive Council, John Barnes; Attorney-General, F. Brennan; Postmaster General and Minister for Works and Railways, Albert Ernest Green; Trade and Customs, Michael Forde; Home Affairs, Arthur Blakeley; Health and Repatriation, John McNeill; Defense, J. B. Chifley; Markets and Transport, Parker John Moloney; Assistant Ministers, Senator J. B. Dooley, E. J. Holloway, C. E. Culley. The United Kingdom in 1931 appointed a High Commissioner to Australia, following similar action with regard to Canada and South Africa. The post was temporarily filled by E. T. Crutchley. For the Commonwealth election of 1931 see under *History*.

#### HISTORY

Sinking their political and class differences, the Australian people united in June and July of 1931 to combat on a basis of equal sacrifice the most menacing economic crisis in the Commonwealth's history. The entente ended the constitutional dispute between the governments of the Commonwealth and of the state of New South Wales, then before the Australian High Court. Union was achieved, however, only under the direst economic necessity and after a prolonged political struggle during which recalcitrant political leaders were forced by a great tide of public sentiment to fall in line. At the end of the year the country was engaged in a strenuous effort to balance the budget, restore Australia's credit, and set the wheels of industry moving normally once more.

The effort to extricate the country from its financial morass in 1930 through adoption of the Niemeyer programme had been frustrated by the victory of the radical Labor candidate, J. T. Lang, in the New South Wales state election of November (see 1930 YEAR BOOK). Mr. Lang won overwhelmingly on a platform of violent opposition to the Niemeyer retrenchment proposals, which he attacked as undermining the standard of living of the laboring masses. In the months that followed the nation drifted slowly toward economic catastrophe, while a fierce struggle raged within the predominant Labor party. Parliament remained in a stalemate, with the radical element vetoing economies intended to balance the budget and the moderate element rejecting the radical proposals for monetary inflation.

The stalemate ended early in January, 1931, with the return of Prime Minister Scullin to Australia from England. Soon afterward he restored to office E. G. Theodore, a resourceful and enigmatic politician, who had been forced to re-

sign the post of Federal Treasurer the previous June. Mr. Theodore had retired after a Royal Commission charged him with dishonestly exploiting the government of Queensland during his term as Premier of that state. In the meantime he had further aroused the ire of the Opposition and of moderate elements within the Federal Labor party by espousing the left wing policy of inflation as a way out of the depression. His reappointment caused the resignation from the Federal Labor Cabinet of the Acting Treasurer, J. A. Lyons, and of J. E. Fenton, Acting Prime Minister in Mr. Scullin's absence.

Instead of turning more definitely to the left upon the withdrawal of the two moderate Ministers and their followers, the Labor party split into two violently hostile groups. One group, headed by the Prime Minister and Mr. Theodore, stood for the latter's programme of inflation. The other espoused the so-called "Lang plan" and attempted to read out of the party those who opposed it. With the approval of the Federal Cabinet, the Commonwealth Labor caucus, and three of the six state Premiers, Mr. Theodore introduced his bill for currency inflation in March. It provided for the immediate issuance of £18,000,000 of fiduciary currency, of which £12,000,000 was to be used for the relief of unemployment and £6,000,000 for farm relief. The issue was to have no gold backing at first, but when market conditions permitted a loan was to be raised to cover it.

Mr. Lang's plan, which he presented at a Conference of the state Premiers on Feb. 9, 1931, was even more radical. He proposed that no further interest be paid on Australia's war debt to Great Britain or on government loans raised on the London market until the mother country granted Australia terms at least as favorable as those which Britain had obtained from the United States. He further demanded the reduction of the interest rate on Australian internal bonds to 3 per cent and the complete abandonment of the gold standard. A currency based "on the productive capacity of the country" was to be substituted.

The New South Wales Premier put his policies into effect by defaulting on interest payments totaling £729,251 due on the state debt in London April 1. He repeated his default on other interest payments due in London and New York July 1. The Commonwealth Government immediately met these obligations under authority of the Financial Agreement Validation Act of 1929. And on April 13, it brought suit for reimbursement in the Australian High Court, at the same time withholding sums due to New South Wales from the Commonwealth Treasury.

The default of New South Wales had numerous repercussions. A wave of resentment toward Mr. Lang swept the Commonwealth, as the threat of repudiation undermined Australian bonds on the world money markets. In New South Wales there arose active movements for secession from the state, centering in the Riverina section in the southwest and the New England district in the northeast. Within the Commonwealth, Premier Lang's action intensified the state's rights sentiment already active in Western Australia, South Australia, and Queensland. In these states there were agitations for withdrawal from the Federation, partly based on a desire to end the compulsory association with "repudiationist" New South Wales. An "All for Australia League"

was formed toward the end of February in response to Mr. Lang's threat of default. It inaugurated a widespread campaign for a non-partisan effort to save Australia's credit, meet all debt payments in full, and end the régime of "machine politics."

On April 7 all elements opposed to the policies of both Mr. Theodore and Mr. Lang formed a United Australia party, headed by Mr. Lyons and with J. G. Latham, leader of the Nationalist party, as deputy leader. The Country party alone retained its independent status. Anxious though it was to join in overthrowing the Federal Labor Cabinet, it held out for a 25 per cent reduction in the tariff and the free importation of agricultural machinery, which the United Australia party was not prepared to concede. A state election in Tasmania and various party conferences indicated a popular swing away from the radical Labor policies.

Meanwhile Premier Lang had introduced bills into the New South Wales Legislature reducing to 3 per cent the interest on government bonds, the rate which banks might legally pay to depositors or charge for loans, and the rate which mortgagees might charge on mortgage loans. Although promptly rejected by the State Legislative Council, these measures created a panic among depositors in the New South Wales Government Savings Bank at Sydney. The bank was the largest bondholder in the state, owning £30,000,000 of bonds on which the Premier was trying to reduce the interest. A "run" developed which forced the bank to suspend operations temporarily on April 23.

The suspension of the bank, in which the funds of a million depositors aggregating £54,000,000 were tied up, proved a death blow not only to Premier Lang's bid for control of the Australian Labor party but also to the inflation scheme of the Federal Treasurer. Further development of a panic, which next threatened to close the Commonwealth Savings Bank in Sydney, was prevented by the intervention of the Commonwealth Bank Board, an institution corresponding to the Federal Reserve Board in the United States.

Mr. Theodore's fiduciary currency bill and allied measures experienced hard sledding in the Federal Parliament, which convened Mar. 5, 1931. His other measures provided for distribution of the proposed £6,000,000 farm relief fund, for an increase in taxes on incomes derived from government bonds and on salaries of civil servants, and for the creation of a board to advise the governments (State and Federal) on the reduction of bank interest rates. Another bill authorized the government to requisition gold from the Commonwealth Bank Board to meet overseas interest payments. The Commonwealth Bank, in return, was to receive an equal amount of government securities and to be relieved of the duty of redeeming notes with gold upon demand.

While Premier Lang assailed Mr. Theodore's measures on the ground that a bolder attack on the gold standard was needed, the Opposition parties in the Federal Parliament considered them a futile effort to evade economic realities. Three motions of censure were introduced by the Opposition between March and May in efforts to overthrow the Cabinet. And each time Prime Minister Scullin was forced to turn for support to the five deputies from New South Wales con-

trolled by Premier Lang. The Cabinet's margin of safety dwindled from five votes on the first motion to two on the third.

Passed in the House of Representatives by a majority of only five votes on the second reading March 25, the Fiduciary Notes Bill was sent to the Senate, where the Nationalist majority rejected it on April 17. The Prime Minister indicated that he would again pass the bill in the House and return it to the Senate, and that Parliament would be dissolved after the customary three-months interval if the Senate rejected it a second time. An election on the issue of inflation was averted, however, by the pressing necessity of immediate action to avert national default. Both the Federal and State Governments were spending in excess of their receipts. Since the foreign loan markets had been closed to Australia, the governments had been forced to resort to short-term credits from London and Australian banks. The short-term indebtedness of the Federal Government had increased from £5,000,000 on June 20, 1929, to about £55,512,000 on Feb. 28, 1931. If these loans were called it meant disaster.

On April 15, the Prime Minister obtained some slight relief from the British Government, which agreed to prolong for two years the period within which the Commonwealth had contracted to pay its war debt to Great Britain. This relieved the government of the necessity of finding £3,200,000 for war debt payments over two years. The Prime Minister was compelled, however, to find £5,000,000 to redeem Treasury bills maturing in London on June 30. His hopes that the Australian banks would advance this sum were dispelled when the Commonwealth Bank Board on April 17 notified the Federal and State Governments that no further short-term credits would be extended them beyond the £25,000,000 needed to carry them to the end of the fiscal year (June 30). Thus further economies were essential.

With the consent of the Cabinet, the Australian Loan Council at its April meeting appointed an economic committee to report on the steps necessary to balance the Federal and State budgets. On May 23, the Copland Committee, as it was called, reported that under existing budget and price levels the deficit of the Commonwealth and states would amount to £31,150,000 for the fiscal year ending June 30, 1931, and to £39,080,000 for the year 1931-32. Condemning Mr. Theodore's fiduciary currency bill, the committee recommended that the budget deficits be reduced in three ways. It suggested a 20 per cent cut in government wages and salaries as of June 30, 1930, estimated to save £8,900,000, and reductions in old-age, invalid, and war pensions, calculated to save £4,200,000. It recommended an increase in income taxes and in entertainment, sales, and primage taxes, which it estimated would yield an additional £12,000,000. A third measure, the conversion of the internal debt to a lower rate of interest, was calculated to save £5,500,000. A reduction of bank rates of interest on deposits and advances and lower mortgage interest rates were provided for. These savings and increased income totaled £30,500,000, leaving an estimated deficit of about £9,000,000 for the 1931-32 fiscal year for both State and Federal Governments. The committee recommended that this gap be met by borrowing.

The Copland Plan was formally accepted by the Federal and all the State Governments, with

the exception of New South Wales, on June 10. Mr. Scullin invited and secured the coöperation and approval of the Opposition parties in the Federal Parliament, but not until he had yielded to their insistence that the bond conversion operation be voluntary rather than compulsory. Mr. Lang held out stubbornly for compulsory conversion, but finally approved the plan with a face-saving reservation. New South Wales would not put into effect the 20 per cent cut in expenditure, but stipulated, until the conversion loan had been successfully carried out. Before the conversion loan was launched, however, the New South Wales Treasury became so depleted that Premier Lang appealed to the Commonwealth Government for assistance. He stated that £3,500,000 would be required to carry the state through July, August, and September. The Commonwealth Loan Council, to which Prime Minister Scullin submitted Mr. Lang's appeal, offered to advance the needed funds if Mr. Lang would assume responsibility for the payment of interest on the public debt, resume active membership in the Loan Council, and give immediate effect to the Copland plan.

The New South Wales Premier capitulated on July 28 and the Commonwealth Government immediately arranged to meet £832,000 in interest payments on the state's debt due in London and New York July 31. Further credits were withheld pending actual introduction of the 20 per cent reduction in New South Wales Government expenditures. The Legislative Council of the state rejected Mr. Lang's first economy bill, which provided for a cut in all of the higher salaries to a maximum of £500, or less than \$2500 a year. On August 6, the state was unable to pay civil service salaries totaling £270,000 due on that date, and the Premier accordingly introduced a second economy bill acceptable to the Legislative Council. This bill, which called for a slash of one-third in salaries of £1500 and over, with smaller reductions in lower brackets, was passed August 7. On the following day, the Loan Council advanced a credit of £500,000 to New South Wales. All six states were advised by the Loan Council that any evasion of the economy measures adopted would be punished by the withholding of further credits. On October 10, the Federal Treasurer announced in Parliament that New South Wales had agreed to meet all future interest payments on the state debt and to refund to the Commonwealth the net debt of about £4,550,000, representing defaulted interest payments shouldered by the Commonwealth less the sum which the Commonwealth had withheld from distribution to the state. In return, the Federal Government dropped the suit for recovery of the debt which was still awaiting a hearing before the High Court of Australia.

The bills putting into effect the Copland plan were passed in the Federal Parliament by large majorities, composed of the Opposition and many Labor members. A small section of the Labor party refused to accept the plan and two members of the Scullin Ministry resigned. Both the Federal Labor party caucus and its executive committee condemned the wage and pension cuts imposed, but admitted that the plan "must be accepted in the circumstances." The Melbourne municipal elections, held while the Federal Labor party executive was in session in that city at the end of August, was fought on the issue

of the reduction of wages of municipal employees. Labor lost 12 seats on the municipal council.

With the passage of the economy legislation, the attitude of the banks toward the Federal Government changed. They renewed nearly £22,000,000 worth of Treasury bills, which they had threatened to present for redemption, and reduced the interest rate on these credits from 6 to 4 per cent, thus saving the government £434,000 annually. Mr. Theodore was able, also, to secure approval of a bill to ship £5,000,000 of the gold reserves of the Commonwealth Bank to London to meet payments due on June 30. The bill provided that the gold reserve might be reduced to 15 per cent in 1933, but that by 1934 it must reach 18 per cent and by June, 1935, the normal level of 25 per cent.

The effect of the Copland plan upon the Federal and state finances for 1931-32 is set forth above under *Finance*. A conference of the state Premiers held at Melbourne early in September to examine the financial position of their governments reported that the aggregate deficit for 1931-32 would exceed by at least £3,000,000 the aggregate deficit as estimated the previous June. The Premiers agreed to initiate further economies to wipe out £2,000,000 of this new deficit, while the banks agreed to advance credits to cover the remaining £1,000,000. In Victoria, the Hogan Ministry added 25 per cent to the state income tax, and thus reduced to £500,000 the estimated state deficit for the fiscal year 1931-32.

**CONVERSION LOAN SUCCEEDS.** Meanwhile the Australian Conversion Loan, which was opened in the middle of August, was pushed through successfully in three weeks. About 97 per cent of the holders of Australian internal (Federal and state) obligations totaling £556,000,000 voluntarily converted their bonds, carrying an average rate of interest of 5.4 per cent, to new securities with an average rate of 4 per cent. The saving on the interest burden of the taxpayers was about £6,500,000 annually. About 25,000 bondholders owning bonds aggregating £18,293,259 rejected the appeal. In accordance with a decision reached at the Premiers' Conference of September, however, they were forced to convert on the same terms as those who had done so voluntarily.

**REFERENDUM ON UNITARY GOVERNMENT.** The Scullin Government on October 12 announced that it would hold a referendum after Christmas on the question of abolishing the State Parliaments, centralizing all sovereign powers in the Federal Parliament, and delegating local powers to provincial councils in local governing areas. The government also asked that the Federal Parliament be given the right to alter the Constitution at will.

The Labor Government's proposal was a shrewd effort to take advantage of the wide spread demand for economy and unified action in the face of the economic crisis in order to realize one of the party's major aims—the super session of the states by the Federal Government. With control of a unitary Federal Parliament, Labor would be in a much more favorable position to put into effect the socialization of the means of production, distribution, and exchange, which was its primary objective. Moreover, every party which had obtained control of the Federal Parliament had found its power inadequate to meet problems confronting it

**LABOR GOVERNMENT OVERTHROWN.** Before the referendum measure could be submitted to the people, the Scullin government was defeated in Parliament (November 25), by a vote of 37 to 32. The Government's defeat after 25 months in office came as a result of a switch to the Opposition of the five Lang adherents in Parliament. The issue involved was a patronage dispute between Federal Treasurer Theodore and John Albert Beasley, one of the extreme Left Laborites. Parliament was prorogued the following day, the general election being fixed for December 19. The coalition of the United Australia and Country parties won a striking victory in the election, capturing an anti-Labor majority of some 39 seats in the House of Representatives. The standing of the parties following the election, according to the complete results, was: United Australia party, 39; Country party, 16; Independents, 2; Federal Labor party 14; Lang Laborites, 4.

Prime Minister Scullin retained his seat in Parliament, but Mr. Theodore and most of the other Cabinet members were defeated, while former Premier Stanley Bruce, who was defeated in 1929, was elected to Parliament by a 20,000 majority. Mr. Scullin resigned as Prime Minister December 21, without awaiting final returns, and Joseph A. Lyons was called by the Governor General to form a new Cabinet. The new Ministry, announced Dec. 31, 1931, was composed as follows: Prime Minister, Joseph A. Lyons; Attorney General, John Latham; Defense, George Pearce; Trade and Customs, H. S. Gullett; Vice President Executive Council, Alexander McLachlan; Home Affairs, Archdale Parkhill; Markets and Transport, Edward Hawker; Health and Repatriation, Charles Marr; Postmaster General, James Fenton; Ministers without Portfolio, Stanley Bruce, Massey Greene, Josiah Francis, and John A. Perkins. Mr. Lyons immediately gave assurance that the finances of the Commonwealth would be conducted in a manner to sustain complete confidence in its financial stability and honor. He himself assumed the direction of the Treasury.

**OTHER EVENTS.** Australia during 1931 took a prominent part in the movement toward the economic collaboration of the various units of the British Commonwealth of Nations. Of chief importance in this connection was the conclusion of a commercial treaty with Canada, negotiations having been under way since the breakup of the Imperial Conference in 1930. By the agreement each Dominion granted the other the benefit of British preferential tariff rates on practically all commodities exchanged. In some cases preferences greater than those accorded British goods in the two Dominions were mutually extended, along with various other mutual concessions intended to stimulate trade. In line with this trend toward economic unity within the British Commonwealth, was the Empire Wool Conference held in Melbourne during June under the auspices of the Woolgrowers' Association of Australia.

On Jan. 22, 1931, the Commonwealth Arbitration Court authorized a 10 per cent reduction in the basic wage scales for at least 12 months, as an emergency measure. The Federal Attorney General applied to the Court for a postponement of the award on the ground that it might hinder the Government's plans for stimulating industry, but the Court on February 5 rejected the application. In accordance with an agree-

ment reached between officials of the Commonwealth and of the states, an amended Federal-aid roads bill was introduced in the Federal Parliament in October. The agreement provided that, effective July 1, 1931, the Commonwealth would pay the state a sum equal to about \$0.05 a gallon on imports of gasoline, and a further sum equal to about \$0.03 a gallon on gasoline refined in Australia. In introducing the bill, the Prime Minister said that provision had been made in the 1931-32 budget for the distribution of about £1,360,000 to the states, based on the current consumption of gasoline. The new arrangement replaced the 10-year Federal-aid road agreement of 1926, under which the Commonwealth paid the states about £1,940,000 a year to match a total of about £1,450,000 a year contributed by the states.

MacCallum, "The Australian Financial Crisis," *Foreign Policy Reports*, Sept. 16, 1931 (Vol. VII, No. 14); Edward Shann, "Stalemate and Reconstruction in Australia," *Foreign Affairs*, October, 1931.

**AUSTRIA.** A federated republic of central Europe proclaimed Nov. 12, 1918, and consisting of the nine provinces of Vienna (City of), Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Tirol, Vorarlberg, and Burgenland. Capital, Vienna.

**AREA AND POPULATION.** At the census of 1923 the area was 32,369 square miles and the population, 6,534,481, as compared with an area of 39,017 square miles and a population of 7,529,935 in 1910. The estimated population Jan. 1, 1930, was 6,704,467. At the 1923 census the City of Vienna had 1,865,780 inhabitants, or 28.55 per cent of the total population; in 1930, the estimated population of the city was 1,842,763. Other chief cities, with their populations in 1923, are: Graz, 152,706; Linz, 102,081; Innsbruck, 56,401; and Salzburg, 37,856. The movement of population in 1929 was: Births, 112,121; deaths, 97,428; marriages, 51,523; divorces, 5350. Emigrants in the same year totaled 4850, of whom 1268 went to the United States.

**EDUCATION.** Elementary education is compulsory for children between the ages of 6 and 14 years. In 1928, there were 5315 public and private elementary schools, with 722,896 pupils; 151 secondary schools, with 49,197 pupils; and various commercial and vocational high schools. The three state universities at Vienna, Graz, and Innsbruck had 10,500, 1870, and 1871 students, respectively, in 1928. In the same year, there were 35 normal colleges, with 5182 students.

**PRODUCTION.** Agriculture is the main support of the population, with manufacturing, lumbering, and mining occupying important subsidiary rôles. In 1929, there were about 4,782,000 acres of arable land, or 23 per cent of the total area; 5,713,000 acres of permanent meadow and pasture; 305,000 acres of trees, shrubs, and bushes; and 7,752,000 acres of woods and forests. The principal crops, with the production during 1929 and 1930, are shown in the accompanying table from the 1931 *Commerce Yearbook*.

The mining, lumbering, and manufacturing industries were severely affected by the economic depression during 1930 and 1931. In November of the latter year, many industries were operating at less than 50 per cent of capacity. Statistics of mineral and manufacturing production for

\* Unit, gallon of wine.

\* Unit, pound.

\* Mangolds only.

<sup>1</sup> Thousands of units—bushels except as indicated.

1930, with figures for 1929 in parentheses, were: Coal, 216,000 metric tons (208,000); lignite, 3,063,000 metric tons (3,525,000); iron ore, 1,178,000 metric tons (1,891,000); magnesite (sintered), 124,226 metric tons (140,410); crude steel, 528,000 metric tons (631,933); pig iron, 287,001 metric tons (462,240); copper, 3654 metric tons (3895); lead (smelter), 6923 metric tons (6569); wood pulp, 103,470 metric tons (104,210); cellulose, 213,460 metric tons (224,450); paper, 210,260 metric tons (229,550); cotton yarn, 43,550,000 pounds (54,723,000); beer, 134,286,000 gallons (138,001,000).

Iron and steel production in 1930 was lower than in 1926, the worst year of the preceding depression period. The number of unemployed in March, 1931, was 304,082, or 64,988 more than on the same date of 1930. In 1930 there were but 80 strikes and five lockouts, compared with 202 strikes and 24 lockouts in the preceding year.

COMMERCE. Austria's foreign trade declined sharply in 1930, as compared with 1929, and the heavy excess of imports continued. Exports were valued at \$261,000,000, as against \$307,900,000 in 1929, while imports totaled \$379,200,000, as against \$459,000,000 in the previous year. The adverse visible balance of trade was \$118,200,000 in 1930 and \$151,100,000 in 1929. According to preliminary figures for 1931, imports declined 457,000,000 schillings (\$63,980,000 at par), or 17 per cent, below the 1930 total. Exports decreased 530,000,000 schillings (\$74,571,000 at par), or 28 per cent.

As compared with 1929, the 1930 imports declined 17.6 per cent in value and exports, 15.2 per cent. Exports of livestock, foodstuffs, and beverages increased, but those of timber, cotton goods, motor vehicles, and machinery declined considerably. Germany accounted for 21 per cent of the total value of Austrian imports, followed by Czechoslovakia with 17.8 per cent, Hungary with 10.6 per cent, and the United States with 5.4 per cent. Germany also took 17.3 per cent of all Austrian exports (15.7 per cent in 1929), while Czechoslovakia took 11.9 per cent (13.5), Hungary 6.4 (7.5), and the United States 2.7 (3.5).

FINANCE. Austrian budget operations for the fiscal calendar year 1930 resulted in a deficit of about 13,000,000 schillings or about \$1,830,000 (1 schilling equals \$0.1407 at par), the first deficit in current accounts for seven years. Expenditures on current account totaled 2,040,000,000 schillings, or 91,000,000 schillings above the

budget estimates, and revenues were 2,207,000,000 schillings, or 45,500,000 schillings more than anticipated. Unemployment benefits and subventions to agriculture and industry accounted for the major part of the rise in expenditures. For capital investments 248,400,000 schillings, or 17,000,000 less than anticipated, were expended out of the League of Nations loan and the Austrian international loan of 1930. Including these sums, the budget deficit in 1930 was 261,000,000 schillings.

Budget estimates for 1931, as passed by the National Assembly, anticipated revenues of 2,160,000,000 schillings and expenditures of 2,130,000,000 schillings, leaving a surplus of 36,000,000 schillings. Faced by a budget deficit and outside demands (see below under *History*), Parliament on Oct. 3, 1931, passed an emergency bill calculated to produce additional revenues amounting to 100,000,000 schillings (about \$14,000,000) and to reduce expenditures by 220,000,000 schillings (\$30,950,000). On Jan. 1, 1931, the Federal debts totaled 2,776,000,000 schillings while Federal claims amounted to 1,564,000,000 schillings, mainly against the Federal railways for advances on capital investments. Included in the Federal debt was the League of Nations loan (873,000,000 schillings), the Austrian international loan of 1930 (439,000,000 schillings), the currency debts (243,000,000 schillings), and the so-called "kronen and schilling" debts (137,000,000 schillings). See also under *History* below.

COMMUNICATIONS. At the beginning of 1929, Austria had 4156 miles of railway line, of which 3029 miles were owned and operated by the Government, 533 miles operated by private companies, and 594 miles operated for private companies by the Government. Beginning in 1923, the Federal Railways were operated as an autonomous enterprise. The railway budget estimates for 1931 anticipated a deficit of 27,800,000 schillings, after payment of interest charges on loans. Highway mileage in 1931 totaled 21,273 miles, of which 2450 were national roads, 1029 miles provincial roads, 11,926 miles departmental, and 5868 miles municipal roads. Regular air services were maintained by the state-subsidized Austrian Air Transportation Company. Various airlines linked Vienna with the principal European capitals. Direct radio-telegraph service between the United States and Austria was inaugurated Apr. 22, 1931.

GOVERNMENT. Under the Constitution adopted Oct. 1, 1920, and amended Dec. 7, 1929, executive power is vested in a president, elected by popular vote for six years, who appoints the Ministry and has power to dissolve Parliament. Legislative power rests with an assembly (Nationalrat), elected by popular vote for four years, and a first chamber (Bundesrat), chosen by the Provincial Diets in proportion to the population of the respective Provinces. The composition of the Nationalrat following the election of Nov. 9, 1930, was: Social Democrats, 72; Christian Socialists, 66; National Economic party, 19; Heimwehr, 8. President of the Republic, Dr. Wilhelm Miklas, elected Dec. 5, 1928. The Ministry constituted Oct. 3, 1930, represented a coalition of the Christian Socialist and National Economic parties. The members were: Chancellor, Dr. Otto Ender (Christian Socialist); Vice Chancellor and Minister of Foreign Affairs, Dr. Johann Schober; Defense, Karl Vaugoin (Christian Socialist); Justice, Dr. Hans Schurr; Agriculture and

Forestry, Dr. Engelbert Dollfus (Christian Socialist); Finance, Dr. Otto Juch (Christian Socialist); Commerce and Communications, Dr. Eduard Heindl (Christian Socialist); Education, Dr. Emmerich Czermak (Christian Socialist); and Interior, Franz Winkler.

### HISTORY

Austria during 1931 was scourged by the worldwide economic depression, by serious financial and exchange difficulties, and by the strife of political factions, all three factors forming a vicious circle of mutual aggravation. Moreover, Austria threw in her lot with Germany in a sanguinary diplomatic and financial struggle against France—a struggle which materially aided the forces of chaos and disintegration in Europe. The conflict opened with the announcement of the Austro-German Customs Union project on Mar. 21, 1931. It closed on September 3, when Austria and Germany formally renounced the customs union protocol. Decisively beaten by France's overwhelming financial strength and political prestige, the German and Austrian Governments were forced to go hat in hand to Paris, begging aid to prevent their impending financial and administrative collapse. France proved a close bargainer, however, and the half-hearted help she finally extended in collaboration with Great Britain, American banking interests, and the International Bank proved insufficient to repair the damage done to international confidence and credit. The end of the year found Austria perceptibly closer to the brink of chaos and insolvency than at its opening. (See GERMANY under *History* for a more detailed account of the Customs Union project and its repercussions.)

The storm aroused in Europe by the Austro-German Customs Union proposal was followed by the withdrawal of French and other foreign short-term credits from Austrian banks. Whether or not the French withdrawals were politically inspired, as was widely charged, they helped to precipitate a crisis in the affairs of the *Credit-Anstalt*, Austria's oldest private bank, which controlled between 70 and 80 per cent of the banking resources and industry of the country. Gross mismanagement, the weakening of the bank by its fusion with the *Boden Credit-Anstalt* in 1929, and the devaluation of Austrian and foreign stocks were other factors contributing to the *Credit-Anstalt's* critical condition, which became publicly known on May 11. To avert its collapse, the Austrian Government placed at the bank's disposal about \$14,000,000 of new capital, to be raised by an issue of three-year treasury notes. The Bank of Austria and the House of Rothschild, which held controlling interests in the *Credit-Anstalt*, also contributed about \$4,000,000 each. On May 14, Parliament authorized the Government to float a \$21,000,000 loan, of which \$14,500,000 was required to place the finances of the bank on a sound basis.

The Bank of International Settlements on May 18 extended a three-months' credit of \$14,000,000 to Austria. But the efforts to raise a loan of \$21,000,000 met the stubborn refusal of French bankers to participate unless Austria first abandoned the customs union and submitted to international financial control. When the French conditions were revealed to British leaders, the Bank of England stepped into the breach on June 17 and advanced Austria an interim credit

of \$21,000,000 without guarantee, subject to renewal as long as necessary. The British action was prompted in part by the fact that of the *Credit-Anstalt's* total foreign debts of about \$375,000,000, some \$135,000,000 was due to British creditors, who stood to lose everything if the bank collapsed. American interests had loaned nearly \$120,000,000 to the *Credit-Anstalt*, France, the Netherlands, and Switzerland about \$30,000,000 each, and Germany about \$25,000,000. On June 16, a committee representing the creditors of the bank undertook not to withdraw their credits for two years, provided the Austrian Government guaranteed the bank's liabilities. On June 26, the Government guaranteed both the domestic and foreign liabilities of the *Credit-Anstalt*, estimated at a total of \$450,000,000.

The financial situation had already caused one Cabinet crisis, the Pan-Germans having threatened to withdraw from the Government coalition on May 19, when Chancellor Ender proposed to balance the budget by drastic cuts in the salaries and pensions of state employees and a further tax on salaries. The Cabinet weathered this storm only to fall on June 16, when the Peasants' party withdrew its support from the coalition. The Peasants objected to the assumption of such far-reaching financial obligations by the Government. Four days later (June 20), after Dr. Ender, former Finance Minister Guertler, and the former Chancellor, Mgr. Seipel, had successively failed to form a new government, a second coalition cabinet was formed by Dr. Karl Buresch, Governor of the Province of Lower Austria. Dr. Johann Schober retained the portfolio of Foreign Affairs, the other members being: Interior and Vice Chancellor, Franz Winkler; Social Welfare, Dr. Josef Resch; Justice, Hans Schuerff; Army, Karl Vaugin; Trade, Edward Heini; Agriculture, Engelberg Dolphus; Education, Emmerich Czermak; and Finance, Dr. Joseph Redlich. Dr. Redlich was widely known in the United States as a professor in the Harvard Law School. With measures for the rehabilitation of the national finances absorbing the attention of the new Government, there was little disposition to push the customs union proposal. Then, too, the financial crisis in Germany had become increasingly severe and the Christian Socialists seized the opportunity to point out that British and French financial aid was more to be relied upon than the hope of economic union with Germany.

Despite foreign aid, the Government fought a losing struggle against the financial crisis. On August 11, it was compelled to appeal once more to the League of Nations for assistance. It asked the Council of the League to examine Austria's economic and financial problems and recommend methods for meeting them. League representatives were immediately sent to Austria to study the financial situation and on September 17 the financial committee of the League agreed to advance a temporary credit of 250,000,000 schillings (about \$35,175,000). It stipulated, however, that Austria must first reduce its expenditures for the 1931 fiscal year by 35,000,000 schillings (about \$4,900,000), cut the 1932 budget expenditures to 1,900,000,000 schillings (about \$267,300,000), and set aside for both 1932 and 1933 a sum of 100,000,000 schillings (\$14,000,000) for service of the loan. The League finance committee further recommended that Austria balance the budgets of the Federal Railways and the postal service, reduce governmental expenditures, cut

the cost of production in industry, and take measures to improve the position of the *Credit-Anstalt* and other Austrian banks. Figures issued by the Austrian Government showed that its expenditures had increased from \$150,000,000 in 1926 to \$286,000,000 in 1929 and \$305,000,000 in 1930. For 1931 they were estimated at \$329,000,000, the deficit for the year being provisionally estimated by Chancellor Buresch in September at \$23,000,000.

With payments of 200,000,000 schillings (\$28,600,000) due the Bank of International Settlements and the Bank of England on October 16, Austria was virtually forced to accept these conditions. An emergency bill, providing for a reduction of expenditures by 220,000,000 schillings (\$30,950,000) annually and for increased taxation calculated to bring in about 100,000,000 schillings (\$14,000,000) annually, was passed by Parliament October 3 with only eight dissenting votes. Despite the large majority received in Parliament, the tax increases and salary cuts aroused bitter opposition among sections of the population. Hostile demonstrations against tax collectors in rural sections of the Provinces became increasingly alarming and on November 19 the Cabinet announced a relaxation of the tax laws affecting peasants and small traders.

Nor did the emergency measures halt the steady drain on Austria's gold reserves. On October 8, the Government restricted foreign exchange transactions to the Bank of Austria, or institutions designated by it, following the lead of the other countries of southeastern Europe. Thus the entire region returned to the state of near chaos prevailing immediately after the World War. The inability of the Government to meet the payments to the Bank of International Settlements and the Bank of England on October 16 caused both institutions to renew their credits; the period for repayment of the \$14,000,000 owing the Bank of England was postponed to Jan. 16, 1932. It was officially announced on October 22 that the Bank of France had advanced an \$8,500,000 credit to the Austrian National Bank through the medium of the International Bank, with the aid of which it was planned to moderate the exchange restrictions. The loan, however, was held up by the International Bank pending the acceptance by Austria of its recommendations not adopted in the Austrian emergency budget law of October 3, including the reorganization of the *Credit-Anstalt*. The Buresch Government on October 19 dismissed 25 of the 28 directors of the Bank, but it apparently hesitated to face the political repercussions feared as a result of the closing of many factories and other drastic measures involved in reorganization of the institution. While some \$70,000,000 of foreign short- and medium-term credits remained in the *Credit-Anstalt*, the greater part of the Austrian deposits had been withdrawn. It was costing the Austrian National Bank, in other words, the Government, \$15,000 a day to maintain the *Credit-Anstalt*, with the possibility that a continued drain of this size would bankrupt the Government.

**THE HEIMWEHR REVOLT.** National concern aroused by the development of the financial crisis was temporarily diverted on September 13 by the long-anticipated effort of the Heimwehr to seize control of the Government. The attempted *putsch*, which was launched by the reactionary military organization under the leadership of Dr. Walter Pfriemer in Upper Styria early Sunday morning,

proved an inglorious failure. Late the same night, after Federal troops had been rushed to the scene, Dr. Pfriemer instructed his followers to disband peaceably and he himself fled across the Yugoslav border. The revolt cost three lives and some \$250,000 which the hard-pressed Government could ill afford to spare.

The Heimwehr launched its offensive by occupying public buildings in many towns throughout Upper Styria and mounting machine guns. Proclamations were posted stating that Dr. Pfriemer had assumed the reins of government. Another manifesto issued by the Heimwehr leader declared martial law and announced a new provisional Constitution under which about 100 articles of the existing Constitution were suspended. Meanwhile members of the Socialist *Schützbund*—rival military organization—mobilized and warned Chancellor Buresch that they would take action if the Government did not immediately suppress the revolt. The Federal authorities acted promptly, sending troops to the scene of the revolt from Vienna, Carinthia, and Graz, the Styrian capital. The Heimwehr made no effort to resist and either disbanded of their own accord or submitted to being disarmed. The only casualties occurred at Kapfenberg, where several Socialist workers were killed.

Documents subsequently seized indicated that a plan for a concerted movement by the Heimwehr organizations in other Provinces had been frustrated by a premature move on the part of Dr. Pfriemer. On September 14 a number of Heimwehr leaders, including Prince von Starhemberg, former Minister of the Interior, were arrested on charges of complicity, but were released on bail. Dr. Pfriemer returned to Austria and submitted to arrest on December 7. Tried with seven of his adherents for high treason, he was acquitted by a jury at Graz December 18. On November 3, the leaders of the Austrian Heimwehr decided to cooperate with the National Socialists (Hitlerites) of Germany in opposing the coalition Government in Austria.

**OTHER DEVELOPMENTS.** The abortive Austro-German Customs Union proposal was but one of a number of moves made by the Austrian Government during the year in an effort to improve the country's economic situation. A trade agreement including Italy, Austria, and Hungary, announced May 11, 1931, was calculated to increase mutual trade by cheaper rates of discount on each other's trade acceptances and bills, and a reduction in railroad rates and storage charges. Another trade agreement with Hungary signed July 1, 1931, extended to each country the equivalent of tariff preferences by means of camouflaged rebates. Austria's commercial treaty with Czechoslovakia was abrogated effective July 15.

Other notable events of the year were the resignation of Dr. Redlich from the post of Finance Minister on October 5, the removal of Dr. Straffella from the general-managership of the Austrian Federal Railways on June 5, and the announcement on October 7 that, in order to reduce expenses, the successor to President Miklas would be elected by Parliamentary vote, as provided under the old Constitution, instead of by national plebiscite, as provided by the amended Constitution of 1929. The appointment of Dr. Straffella to the railway post, on the insistence of Karl Vaugoin, Heimwehr leader and Minister of War, caused the resignation of the Schober Cabinet in November, 1930. Clashes between So-

cialists, Fascists (Heimwehr), and Communists marked the observance on November 12 of the 13th anniversary of the proclamation of the Austrian Republic. See GERMANY, FRANCE, ITALY, GREAT BRITAIN under *History*; LEAGUE OF NATIONS.

**AUSTRO-GERMAN CUSTOMS UNION.** See AUSTRIA, GERMANY, and FRANCE under *History*.

**AUTHORS' LEAGUE OF AMERICA.** A national organization of authors, dramatists, and screen writers. It was founded and incorporated in 1912 for the purpose of procuring adequate copyright legislation, both international and domestic; protecting the rights and property of all those who create copyrightable material; advising all such in the disposal of their productions and obtaining for them prompt remuneration therefor; and disseminating information among them as to their just rights and remedies. The league supplies to its members confidential information relating to publishers, theatrical and motion-picture producers, and other persons and companies engaged in the purchase, sale, publication, or production of copyrightable material. The league includes the dramatists' guild, the authors' guild, and the screen writers' guild. Closely affiliated with it is the Authors' League fund, an agency formed by the league to meet its obligations with respect to the care of the sick, the aged, and the unfortunate, the endowment amounting to about \$80,000. The officers in 1931-32 were: President, Inez Haynes Irwin; vice president, Marc Connelly; secretary and treasurer, Luise Sillcox. Headquarters are at 2 East Twenty-third Street, New York City.

**AUTOGIRO.** See AERONAUTICS.

**AUTOMOBILE RACING.** Louis Schneider of Indianapolis was the outstanding figure in automobile racing in 1931. This former motorcycle policeman succeeded Billy Arnold as American Automobile Association champion, because of his remarkable triumph in the 500-mile Memorial Day race at Indianapolis and because of other victories of importance on dirt tracks. In that Memorial Day race, Schneider's winning was a great surprise. Arnold, 1930 winner, escaped death by the narrowest margin in the race and saw his car burn. Fred Frame of Los Angeles finished in second place, Ralph Hepburn of Los Angeles third, and Louis Myer, of Southgate, California fourth. Schneider's time for the 500 miles was 5:10:27.04. In the A.A.A. standings, compiled upon results in races at Indianapolis, Detroit, Altoona, and Syracuse, Schneider scored 712.5 points. Frame was second with 540, and Hepburn third with 362. Shorty Cantlon, driving a Bowes Seal Fast, won at Altoona, L. Moore, in a Boyle Valve, won at Syracuse, and Lou Meyer, in a Jadson, captured honors at Detroit.

Captain Malcolm Campbell, British racing driver, set a new world's record for speed in a test spin at Daytona Beach, Florida, in the first week in February, when he was timed at the speed of 245.733 miles an hour.

**AUTOMOBILES.** With the business depression continuing throughout 1931 motor vehicle production in the United States fell still lower than in 1930 by over a million, upsetting the three-year cycle that had prevailed since 1918, according to which it should have been a normal year. Instead it was the lowest that had been recorded since 1921. The production of cars and

trucks in the United States and Canada was only 2,460,000, less than half that of the peak year 1929 when it was 5,621,715.

Production had been so carefully gauged to demand by this time that the effects of the overproduction of 1929 had been completely wiped out and many manufacturers and dealers showed a better financial statement at the close of the year than they had in 1930. Meantime cars in use were being worn out as fast or faster, as shown by the increased gasoline consumption and the falling off in registration, building up a replacement market that must in time be supplied; the longer that is deferred the more will be the accumulation. So the demand side of the scales was growing heavier while the supply side was becoming lighter and the swing was in a direction promising much better business in 1932 which, if realized, would have a marked effect on restoring better general business conditions, because of the very great number of people affected by the prosperity of this largest of all American manufacturing industries.

A striking result from the slump of sales in the year was the stimulus given to the improvement of product and the effort to offer greater value for the price. More innovations were developed and changes in new models were more pronounced than in any year since the earlier ones of the industry. Most important was that most of them were adopted by nearly all makes, differing in detail but in general following similar principles as to purposes accomplished. Free-wheeling, for example, was found on almost every new model from the lowest to the highest in price. Not all were of the pioneer type incorporating an over-running clutch, for several brought forward the newer idea of providing for automatic disengagement of the main clutch when pressure on the accelerator pedal is released, actuated by vacuum from the engine manifold, typified by the Buick so-called Wizard control. All forms provided for cutting out the free-wheeling action at will allowing the car to run in the orthodox manner with engine and wheels connected, so that the engine compression may be used to retard the car, which is especially desirable when descending long or steep grades.

Either synchronizing devices in transmissions making silent shifting of sliding gears possible, or constant-mesh helical gears for quiet operation, not only in second but other speeds, were as definite a trend as free-wheeling.

Other outstanding improvements developed during the year and very generally adopted on the high and medium priced cars particularly, were ride control whereby the shock absorbers may be regulated from the dash according to the character of the road and automatic starting that cranks the car without the driver stepping on a starting button. The starter operates with the turning on of the ignition switch and if the engine stalls for any reason the electric cranking motor is reengaged.

Nearly every maker adopted new forms of rubber suspensions for the power plant and four makes introduced two-point floating power, all for the purpose of reducing the transmission of engine vibration to the car and its passengers.

There was a pronounced tendency to make functions automatic that were formerly manually controlled and hence dependent upon human judgment, for example, automatic control of the

air intake to the carburetor by means of a thermostat, the choke being fully closed when the engine is cold and gradually opening as the engine warms up. Three makes had this feature and four made the control of the heat to the intake manifold automatic, also through a thermostat. Less and less was being left to the doubtful skill of inexperienced operators.

While the foregoing were by no means all of the new things, they include the more important and those that were the most generally adopted. Individual makes had numerous others. Cadillac and Lincoln had vacuum service brakes and several had the new pearlite iridescent lacquer, both of which may be forerunners of coming common practice.

Trends in refinements and changes in treatment of designs were quite as interesting. There was a move toward still higher engine compressions and more engine power through larger cylinders or more of them. As it stood at the end of 1931 there were only three four-cylinder cars left. Twenty different chassis models carried six-cylinder engines, 34 had eights, six were twelves and two 16-cylinder jobs. Ford did not announce its new models before the close of the year, but it was expected that they would be disclosed possibly before the end of January and that they would include a V-eight and a four interchangeable on a chassis of somewhat longer wheelbase than that of the Model A.

Longer wheelbases, wider, heavier and lower cars were characteristic of most of the new models. Because of this frames were very generally redesigned for greater strength and stiffness. Wheels were in general smaller with tires of larger cross section and steering gears and springs were revamped to do away with shimmy and wheel fight so called. Rear axles had some changes, more using hypoid gears and one make, the Auburn, brought out a dual-ratio rear axle on its new 12-cylinder chassis and also on the customs models of its eight-cylinder line. A planetary gear provides the change from a 4½-to-1 to a 3-to-1 ratio. Selection of the ratio desired is through a lever on the dash but actual shifting is accomplished by suction from the vacuum in the engine manifold when the clutch pedal is depressed.

Bodies as usual showed the most conspicuous changes. Many times in the past when one builder made a striking departure that caught the public fancy, others copied it the following year. Thus, at different times, Nash, Chrysler, Hupmobile or others have set the style. This time it was the Reo Royale of a year previous and the so-called "aerodynamic" lines were found in nearly all of the new cars. There was more in this instance than eye appeal, for there was the utility value of decreased wind resistance that becomes quite pronounced as speeds have been increasing. Another advantage is the doing away with angles and pockets that have been effective dust catchers and hard to clean. So great was the attention being given to this phase of design that it was freely predicted that in the near future there would be even more radical approaches to the "tear-drop" form.

Front ends in keeping with body lines showed a pronounced tendency away from bluntness. Radiators, or at least their grills, were usually pointed, rounded or slanting backward as in the Graham. In general, cooling area was increased as required by the more

powerful engines, and fans were reshaped in order to secure greater efficiency and quietness.

Other refinements in power plants were: better manifolds and fuel mixture heating, combustion chambers, carburetors, cooled fuel lines to prevent vapor lock, oiling-systems, etc.

One of the surprises among announcements at the end of the year was the decision to drop the Oakland from the General Motors line, the Oakland company continuing, however, concentrating its production on Pontiac, but building it in both six and V-eight models. Another company, DeSoto, dropped its eight, continuing with a six only, while the Oldsmobile, that had only a six a year before, adopted a straight eight as well.

The only new make of car of the year was the Rockne which, while produced by a new company of that name, was an added member of the Studebaker family. It was a six-cylinder car in the lower-priced group well supplied with the popular new features including free-wheeling and a silent second, synchronizing transmission.

**STATISTICS.** The annual preliminary statement of Facts and Figures of the Automobile Industry given out toward the close of the year by the National Automobile Chamber of Commerce was the source of the following figures for the year 1931: The total production of cars and trucks in the United States and Canada was 2,460,000. Of this number 2,040,000 were passenger cars and 420,000 motor trucks. Of the passenger cars 92 per cent or 1,880,000 were of closed types. The wholesale value of the passenger cars was \$1,170,000,000 and of the trucks \$260,000,000, making a total of \$1,430,000,000. The average retail price of passenger cars was \$765 and of commercial vehicles \$824.

During the year tire factories in the United States shipped about 51,000,000. The wholesale value of those sold for replacement, i.e. to car owners, was \$325,000,000. (See RUBBER.) The wholesale value of parts and accessories for replacement and service equipment was \$341,000,000. These figures added to the wholesale value of vehicles produced shows the year's grand total of automotive business, including motor vehicles, accessories, service equipment and replacements of parts and tires was \$2,101,000,000—the lowest annual volume since 1921.

The registration in the United States at the beginning of 1931 showed almost no gain and at the end of the year for the first time showed a decline, being only 25,940,000 motor vehicles made up of 22,450,000 passenger cars and 3,490,000 motor trucks. The estimated world registration at the same time was 34,575,000 so that the United States had three-fourths of all the motor vehicles in use. Rather interesting is a comparison of the farm use of motor vehicles and telephones. The latest year for which comparative figures are available is 1930. In that year there were registered on farms 4,134,675 passenger cars and 900,385 motor trucks. Their combined figure, 5,035,060, was nearly 2½ times the number of telephones on farms—2,139,194. The mileage of surfaced highways in the United States increased to 725,000 and the total miles of highways of all types to 3,024,233. During 1931 the expenditure on streets and highways was \$2,400,000,000. See ROADS AND PAVEMENTS.

In spite of the recession in the automobile industry for two years it still remained the largest American industry based on the value of

finished products and it was the largest purchaser of gasoline, rubber, steel, lubricating oil, plate glass, nickel, and lead. As indicative of what the automobile industry meant in American business life, the following figures are significant: 4,020,000 persons were employed in motor vehicle and allied lines. State government revenue from gasoline taxes in 1931 was \$524,000,000 and from motor vehicle taxes \$1,022,000,000. The railroads hauled 3,090,000 carloads of automotive freight. Other industries were largely supported by the automobile industry, which in 1931 took 83 per cent of the rubber production, 60 per cent of the plate glass, 16 per cent of the iron and steel, 17 per cent of the hardwood lumber, 14 per cent of the copper, 26 per cent of the lead, 17 per cent of the aluminum, 30 per cent of the nickel, 11 per cent of the tin, 8 per cent of the zinc, 85 per cent of the gasoline (342,000,000 barrels were consumed by motor vehicles in 1931—an increase over all previous years in spite of the depression), 50 per cent of lubricants (10,300,000 barrels).

The crude rubber used by the motor industry in 1931 totaled 649,700,000 pounds and cotton fabric used in tires 191,500,000 pounds. Retail business created by the sale of vehicles and supplies afforded a living for a great number in addition to those employed in manufacturing for there were 46,000 car and truck dealers, 98,000 garages, service stations and repair shops, 75,000 supply stores and 350,000 gasoline filling stations.

Individual personal transportation takes the larger part of motor vehicles used but the purely commercial use is still considerable. Motor trucks in use numbered 3,400,000 and 26 per cent of these were used by farmers. There were 96,500 motor busses operating. Forty-nine thousand of them were used by 17,000 consolidated schools which meant much for the better education of children in the rural districts. Two hundred and seventy street railways were operating 12,500 busses, 80 steam railroads, 5000; and 85 railroads were using 10,000 motor trucks as part of their shipping service, which serves to show how the older forms of transportation were turning to the use of motor equipment as auxiliary to their facilities. Motor trucks used by the Railway Express Agency added 9427 to the number that were supplementing railroad service.

As the business depression was world-wide there was naturally a great falling off in export business, for there were only 315,000 American motor vehicles sold outside of this country in 1931, this including United States exports and the output of Canadian plants of United States manufacturers. This was a 44 per cent decrease in foreign sales under 1930 and represented 13 per cent of production. The value of motor vehicles, parts and tires exported from the United States and Canada during the year was \$162,500,000. Hardly to be mentioned by comparison were the 710 motor vehicles imported in 1931.

**LEGISLATION.** With 44 State legislatures in session, 1931 had a large output of new or revised laws, and a goodly share of them pertained to motor vehicles or highways. Some 7500 bills were presented, about a fifth of which were enacted into law. Very many of the measures dealt with taxation or highway construction, the effect of efforts to meet shrinking State revenues and relieve unemployment distress. Second in importance were those aimed to increase traffic

safety as through periodic vehicle inspection, licensing of drivers, and installing of safety devices, as well as those regulating vehicle operation.

There was increasing accord of legislation with the Uniform Motor Vehicle Code compiled and recommended by the National Conference on Street and Highway Safety. It represented the joint effort of authorities from every State seeking to standardize regulations covering the use of highways to the end of facilitating interstate operation of vehicles and relieving drivers or tourists away from home territory of the annoyance and embarrassment of violating unfamiliar rules. As finally revised in 1930 it had the official endorsement of the American Bar Association and the National Conference of Commissioners on Uniform State Laws. The Code consists of four acts covering: I, registration; II, car theft; III, operators' and chauffeurs' licensing; and IV, traffic regulation on highways. During 1931 seven States adopted completely or in part one or more of the four acts which raised the total number of States in that category to 23, and the number of acts they had adopted based on the Code, 44.

In 1931 Colorado led by adopting Acts I, III, and IV; Oregon adopted the latter two; California, Nebraska, and Utah the regulatory act, and Iowa, Kansas, Michigan, and West Virginia the drivers' license. In addition Nevada revised its registration and drivers' license laws to practical conformity. Twenty-six States at the end of 1931 had drivers' license laws but in seven of them such measures were not as effective as they might be because of lack of provision for compulsory examination of prospective operators.

The American Automobile Association in 1930 launched a campaign to promote adoption of a uniform financial responsibility measure and during the past year was rewarded by having it enacted into law by Indiana, North Carolina, and Wisconsin.

Insurance companies were especially interested in progress made to combat the "guest suit" evil which had been increasing alarmingly. This is the filing of damages, usually exorbitant, against owners of private vehicles for injuries sustained, or claimed to be, by persons riding with them. Defendants protected by insurance generally make little effort to fight the action and actual collusion between defendant and plaintiff was not uncommon. Colorado, Idaho, Illinois, Kansas, Montana, Nebraska, and North Dakota passed new laws denying compensation for injuries received in automobile accidents where recklessness, carelessness, or deliberate intent of drivers was not established. Texas went even farther by making it apply whether or not the injured party was a passenger.

Requirements relating to safety devices for motor vehicles were revised by nearly half of the Legislatures meeting during the year. To mention one of the most significant, Michigan decreed that all vehicles manufactured after July 1, 1932, to be used in carrying passengers for hire, must be equipped with shatter-proof glass. The passing of the solid tire apparently was to be accelerated by law. Two States adopted legislation banning vehicles so equipped from their highways, Kansas making it effective July, 1932, and Wisconsin two years thereafter. Illinois took action almost as drastic by limiting solid-tired commercial vehicles to a 10-mile-per-hour speed.

Several States increased penalties against reckless or drunken drivers. Michigan defined reckless driving resulting in injuries, but not death, as "felonious driving" and provided a fine not to exceed \$1000 or two years imprisonment or both. In addition the Secretary of State may be directed by the court to suspend the convicted operator's driving license for an indefinite period. New Hampshire made reckless driving resulting in death, subject to fine of \$1000 or up to five years' imprisonment with freedom to also prosecute the offender for manslaughter.

Reciprocity in visiting motorists' privileges spread to four more States: Massachusetts, North Dakota, Nebraska, and Nevada passed laws permitting vehicles from other States to use their highways the same length of time that the visitors' States allow to outsiders, but most of them excepted common carrier commercial vehicles.

Railroads continued to agitate for regulation by the Interstate Commerce Commission of trucks and busses doing an interstate business. Hearings begun in 1930 were carried on into 1931 but no action was taken during the year. See RAILWAYS.

Toward the end of the year the automobile industry was aroused by President Hoover's proposal to increase government revenue by restoring the 5 per cent excise tax on passenger cars and 3 per cent on trucks. It took many years following the World War to get it removed and the year ended with the manufacturers organizing to protest against it as a sales resistance that would retard the return of prosperity by undoing much of the manufacturers' effort to revive business by offering a greatly improved product at a minimum price.

**AVIATION.** See AERONAUTICS.

**AVIATION, NAVAL.** See NAVAL PROGRESS.

**AZERBAIJAN, A'zër-bi-jän' (AZERBAIDZHAN).** The Azerbaijan Socialist Soviet Republic, established Apr. 28, 1920, united with Armenia and Georgia on Jan. 16, 1923, to form the Transcaucasian Socialist Federated Soviet Republic (q.v.). Occupying the southeastern frontier region of Transcaucasia between the Caspian Sea and Persia, Azerbaijan has an area of 32,686 square miles and a population of 2,313,172 (1926 census), of whom about 75 per cent are Moslems. Capital, Baku, with a population of 452,000.

In 1929-30 there were 1479 elementary schools, with 180,200 pupils; 40 technical schools, with 10,000 pupils; and five institutions of higher education, with 5500 students. Agriculture, cattle-breeding, and the exploitation of the extensive Baku oil fields are the principal industries. There were 2,008,000 acres under cultivation in 1928-29, of which (in 1929-30) 370,000 acres were devoted to cotton. In January, 1931, 12.5 per cent of all farms were collectivized. Oil production in 1928-29 was 8,802,000 tons (7,560,000 tons in 1927-28). Copper, textiles, fisheries, and salt are other leading industries. See UNION OF SOVIET SOCIALIST REPUBLICS.

**AZORES, ä-zörz'.** An archipelago in the North Atlantic, situated about 800 miles west of Portugal, of which the Azores are politically an integral part. Area, 922 square miles; population, estimated in 1929 at 240,000. The capital is Angra on the island of Terceira. For the revolt against the Carmona dictatorship in 1931, consult the article on PORTUGAL under History.

**BABCOCK, STEPHEN MOULTON.** An American agricultural chemist, died in Madison, Wis., July 2, 1931. He was born in Bridgewater, N. Y., Oct. 22, 1843, and was graduated from Tufts College in 1866, later studying chemistry at Cornell University (1872-75) and at the University of Göttingen (Ph.D., 1879). From 1882 to 1887 he served as chemist to the New York State Agricultural Experiment Station in Geneva, N. Y. In 1887 he became professor of agricultural chemistry at the University of Wisconsin and chemist to the Wisconsin Agricultural Experiment Station. He also became assistant director of the station in 1901, but retired from all active service in 1913. He investigated especially the chemistry of milk, cheese, and other dairy products, his best-known service being the invention in 1890 of the Babcock test for ascertaining the amount of fat in milk, cream, etc. The Wisconsin Legislature presented him with a bronze medal in 1899 in recognition of this and other services to agriculture, and rewards of merit were granted him by the Paris and St. Louis expositions. In 1930 he received the Capper award for "the contribution of greatest importance to American agriculture."

**BADEN, bā'den.** A constituent state of the German Republic, with a republican form of government established by the Constitution of Mar. 21, 1910. Formerly a grand duchy in the German Empire, it borders on Alsace-Lorraine and Switzerland on the west and south, respectively. Area, 5819 square miles; population in 1925, 2,312,462, as compared with 2,195,580 in 1919. In 1929 there were 44,545 births, 29,872 deaths, and 19,844 marriages. Capital, Karlsruhe, with 145,604 inhabitants in 1925. The largest city is Mannheim (247,486 in 1925). The majority of the population is Roman Catholic. Education is free, general, and compulsory, the schools being under the jurisdiction of the state. For higher education, there are universities at Heidelberg and Freiburg. In 1930 the total area under cultivation was 2,061,172 acres. Among the agricultural products, oats, rye, barley, wheat, potatoes, and vegetables are the most important. There are numerous manufacturing industries and salt and potash are mined.

In the budgets for both 1930 and 1931, ordinary revenues were fixed at 289,800,000 gold marks (1 mark equals \$0.2382), ordinary expenditures at 283,500,000 marks, extraordinary revenue at 9,100,000 marks, extraordinary expenditure at 20,800,000 marks. Executive power rests in a cabinet comprising the State President, four Ministers, and one State Councillor (Minister without portfolio), all nominated or elected by the Landtag (legislature). The Landtag elected Oct. 27, 1929, for the term ending Oct. 27, 1933, had 88 members, including 34 Centrists, 18 Socialists, and representatives of eight other parties. State President in 1931, Josef Wittenman (Centre party). See GERMANY.

**BAER, WILLIAM STEVENSON.** An American surgeon, died Apr. 7, 1931, in Baltimore, Md., where he was born Nov. 25, 1872. He was graduated from the medical school of Johns Hopkins University in 1896, and three years later became assistant resident surgeon at the Johns Hopkins Hospital. In 1901 he joined the faculty of the Johns Hopkins medical school, being advanced from instructor to associate professor of clinical orthopedic surgery in 1914. During the World War he was assistant and then chief

consultant in orthopedic surgery with the American Expeditionary Forces, discovering, as a result of observation at this time, a new method of treatment of osteomyelitis with maggots that destroyed the infected bone matter but refused to ingest living tissue. He was also visiting orthopedic surgeon and consulting orthopedist at the Sheppard Pratt Hospital, Baltimore, and the Hospital for Women of Maryland, and was surgeon-general of Maryland from 1916 to 1920. His writings include numerous articles, chiefly on orthopedic surgery, in various medical journals.

**BAHAMAS.** A group of British-owned islands off the southeast coast of Florida, 29 in number, of which 20 are inhabited. They also include 661 keys and over 3000 reefs. The islands, which are of coral formation, have an area of 4404 square miles and a population, according to the census of 1931 of 59,828, or 6797 more than at the census of 1921. The important islands with their populations in 1921, are as follows: New Providence, containing the capital, Nassau, 12,975; Andros, 6976; Eleuthera, 6048; Long Island, 4659; Abaco, 3993; Exuma, 3730; Cat Island, 4273. Government primary schools in 1929 enrolled 9351 pupils; aided schools, 3812 pupils; private schools, 1256. In the same year, attendance at private and government secondary schools totaled 326.

Declared imports greatly exceed declared exports, the totals in 1929 being £1,963,776 and £144,021, respectively. Spirits and wines, the leading imports, were valued at £826,787 in 1929, compared with £57,114 for petroleum products, which ranked second in value. Sponges and sisal are the chief exports. Imports from the United States (1929) were valued at £740,865; Canada, £521,508; United Kingdom, £420,421. Revenues in the fiscal year 1929-30 totaled £550,799; expenditures, £578,584. The public debt in 1929 stood at £180,000. Vessels entering the ports in 1929 numbered 1362 of 1,054,712 tons and vessels clearing, 1378 of 1,057,152 tons. Regular air-mail and passenger service between Palm Beach and the Bahamas was inaugurated June 5, 1931. The islands are administered by a governor who is assisted by an executive council and a legislative council, each of nine members, and a legislative assembly of 29 members, the franchise being based on a small property qualification. Governor and Commander-in-Chief in 1931, Sir Charles William Orr.

**BAHRAIN ISLANDS.** See ARABIA.

**BAILEY, SOLON IRVING.** An American astronomer, died in Hanover, Mass., June 5, 1931. He was born in Lisbon, N. H., Dec. 29, 1854, and was graduated from Boston University in 1881. In 1889 he established at Arequipa, Peru, a southern station of the Harvard Observatory, and in 1893, on the summit of El Misti at an elevation of 19,000 feet, the most loftily situated meteorological station in the world. On his return to the United States he was made assistant professor of astronomy at Harvard University, becoming associate professor in 1898 and Phillips professor in 1913 and retiring as professor emeritus in 1925. During 1908-09 he made astronomical observations in the northern part of Cape Colony and also investigated climatic conditions in various parts of South Africa with reference to the desirability of this region as a site for astronomical observation. He later served during 1919-22 as acting director of the Harvard Observatory. In addition

to writing extensively for the *Annals of the Harvard Observatory*, he published *A Discussion of Variable Stars in the Cluster  $\alpha$  Centauri* (1902); an extensive work, *Peruvian Meteorology* (1902); *Recent Total Eclipses of the Sun* (1902); and *History and Work of the Harvard Observatory* (posthumous, 1931). He was also a pioneer in the photographic discovery and measurement of extra-galactic nebulae.

**BAKER, GEORGE F (ISHER).** An American banker, died in New York City, May 2, 1931. He was born in Troy, N. Y., Mar. 27, 1840, and began his banking career as a clerk in the State Banking Department in Albany. Coming to New York City in 1863, he became associated with the newly-organized First National Bank, rising from teller to cashier in 1865 and to president in 1877. He held the latter office until 1909, when he became chairman of the board. During this period he, together with J. Pierpont Morgan and James A. Stillman, wielded a vast national and international financial influence. It was largely through his confidence and judgment that the banking and industrial institutions of the United States were enabled to weather the panics of 1893 and 1907 and other periods of depression. He was a director in numerous railroad, steel, and public utility corporations. He gave liberally to the Metropolitan Museum of Art and to Columbia University, Dartmouth College, Cornell University, and Harvard University, founding at the latter institution the Graduate School of Business Administration.

**BAKU.** See AZERBAIJAN.

**BALFOUR, SIR ANDREW.** A British surgeon and tropical health authority, died in London, Jan. 30, 1931. He was born in Edinburgh Mar. 21, 1873. His education was obtained in his native city—at George Watson's College and at the university, from which he received the M.D. degree in 1898. He also took advanced studies at the universities of Cambridge and Strassburg. In 1900-01 he served as civil surgeon in the South African War, and from 1902 to 1913 was director of the Wellcome Tropical Research Laboratories at Khartoum. He also was appointed sanitary adviser to the Sudan medical department, and medical officer of health for Khartoum. During the World War he was successively a member of the medical advisory committee for the Mediterranean war area, president of the medical advisory committee in Mesopotamia, and president of the Egyptian public health commission. He also served as health commissioner for Mauritius in 1921 and for Bermuda in 1923. After 1923 he was director-in-chief of the Wellcome Bureau of Scientific Research in London and director of the London School of Hygiene and Tropical Medicine. He was president of the Royal Society of Tropical Medicine in 1925-27, and was the recipient of many honors, including the Imperial Ottoman Order of the Osmanieh (4th class) which was bestowed on him in 1907. He was created a Companion of St. Michael and St. George in 1912, a Companion of the Bath in 1918, and a Knight Commander of St. Michael and St. George in 1930. Among his works are: *Public Health and Preventive Medicine* (with C. J. Lewis, 1902); *Reports of the Wellcome Research Laboratories* (1909-12); *Review of the More Recent Advances in Tropical Medicine* (with R. G. Archibald, 1909); *War against Tropical Disease* (1920); and *Health Problems of the Empire* (1924). He was also the author of several

novels: *By Stroke of Sword; To Arms!; Cashiered and Other War Tales; Vengeance Is Mine; and The Golden Kingdom.*

**BALLOONS.** See AERONAUTICS.

**BANKERS' ASSOCIATION, AMERICAN.**

The dominant national organization of banks in the United States, having a membership of about 18,000 banks out of a total 22,000, with assets estimated in excess of 90 per cent of the nation's aggregate banking capital funds of \$9,400,000,000 and total resources of \$70,000,000,000. The association has four major divisions, each devoted to the special interests, technical advancement, and general welfare of the following classes of banks: National, savings, State, and trust company. Within the organization there are also two sections devoted to general banking interests: the American Institute of Banking section and the State secretaries section. The American Institute of Banking section, which is the educational arm of the organization, has an enrollment of 45,000 students from banks in all parts of the country and a general membership of 65,000; the State secretaries section forms a link between the national organization and the 48 State Bankers' Associations.

The association has a protective department which prosecutes continually a nation-wide campaign of prevention, protection, and investigation for all member banks in respect to criminal operations. It also conducts a legal department which keeps bankers informed on developments in the field of banking law and, in connection with the association's State and Federal legislative committees and councils, watches the interests of banking institutions and the public in both State and Federal banking legislation.

During 1931 the organization gave special attention to maintaining equitable bank taxation. Through its economic policy commission, it continued an extensive research into the group-banking movement, involving the operations of 275 bank groups comprising 2000 banks with \$15,000,000,000 in combined resources, together with much theretofore unknown information in this field. This commission also investigated bank failures and branch banking. The educational foundation of the association, with an endowment of \$500,000 to be employed in the furtherance of scholarships and research in banking and finance in educational institutions, allocated 200 loan scholarships valued at \$250 each to students in American colleges. In addition, its public education commission conducted lectures on banking in business schools and civic clubs throughout the United States.

The association holds its annual convention in the autumn of each year, while the executive council meets in the spring. The latter group is a representative body, proportioned to the membership in all States, and is qualified to take action upon certain association matters. The administrative committee, composed of 15 members, including the national officers, heads of the various divisions and sections, and certain others,

acts as the *ad interim* governing authority between meetings of the convention and of the executive council. The 1931 convention was held in Atlantic City, N. J., October 5-8, the chief topics of discussion being branch and group banking, methods for improving bank management, and the bank failure situation. It promptly went on record with approval of President Hoover's proposal for a \$500,000,000 cooperative credit pool to release the frozen assets of sound banks lacking instruments eligible for loans from the Federal Reserve banks, a plan that materially relieved the strained financial situation.

The general national officers elected for 1931-32 were: President, Harry J. Haas, vice president, First National Bank, Philadelphia; first vice president, Francis H. Sisson, vice president, Guaranty Trust Company, New York City; second vice president, F. M. Law, president, First National Bank, Houston, Texas; treasurer, P. D. Houston, chairman, American National Bank, Nashville, Tenn. The continuing activities of the association are carried on by a permanent staff in New York City under the direction of the executive manager, Fred N. Shepherd.

**BANK FOR INTERNATIONAL SETTLEMENTS.** See REPARATIONS AND WAR DEBTS.

**BANKS AND BANKING.** Although the situation of American banking at the close of the year 1930 was not by any means disastrous, facts and tendencies had emerged that were already giving cause for the most serious anticipations. An entirely new turn had been given to banking trends and processes by the breakdown of business and finance in 1929, and it had become apparent that there must be a general reorganization of banking institutions and of their relationships. This state of affairs, evident at the beginning of the year 1931, became even more pronounced as the season advanced and, although from time to time there could be observed some minor modification of dangerous tendencies, the general course of the year's events is epitomized in the fact that about 2300 bank failures—a record of astounding proportions—were registered during the season, while the whole structure of banking at times seemed about to collapse. The shifting of great quantities of credit out of securities, and the tying-up of still greater quantities both through private hoarding and through deliberate inactivity of bank balances, were conspicuous features in the situation, while, toward the close of the twelvemonth, the impending breakdown of State and municipal credit seemed likely to bring on still more hazardous conditions in banking and finance generally.

**NATIONAL BANKS.** From the standpoint of organization and practice, the year 1931 produced no change of much moment in the status of the national banks. The Senate Committee on Banking and Currency had, early in the year, initiated a complete and thorough investigation into the situation of the banking systems of the country; and this inquiry, being in progress, acted as a brake upon the adoption of new measures in Congress while it probably tended to retard the bringing forward of further proposals for banking change either at the hands of the Comptroller of the Currency or of members of Congress. At all events, there was no significant change in the legislative status of the national banking system.

The Comptroller, in his annual report for the year 1930, confined himself to some suggestions

with regard to branch banking, and the liquidation of assets of failed banks; while Congress paid but little heed to his recommendations, being too closely occupied with the general and immediate drift of affairs to consider generalizations. The system itself continued to show shrinkage in numbers partly owing to the immense development of failures during the year, partly as a result of consolidations and partly in consequence of natural tendencies to lessen the number of banks in existence, because of the declining need for small institutions consequent upon change in methods of transportation and of doing business. For the year covered by the the Comptroller's report (ending June 30, 1931) the national system reported a net decrease of 425 members, leaving the total number of charters in force 6886, the smallest for many years. Resources moreover, in contradistinction with former years, reflected losses amounting to \$1,713,000,000 as against \$1,753,000,000 in 1930. The total number of receivers appointed during the year was 237, or more than twice as many as in 1930, when 104 receivers were appointed in the United States.

HEARINGS ON BANKING. The investigation of the banking situation which was undertaken by the Senate committee on Banking and Currency was continued in the form of public hearings during the winter and early spring; and then was followed by a study conducted by the experts attached to the committee. It resulted in a general series of reports on Federal and National banking, made public during the late autumn. These reports developed a large amount of ma-

terial relative to banking tendencies and practices but possibly the most striking of these was furnished in the light thrown by them upon the whole topic of investment banking and the rapid absorption of national bank funds (as well as others) in operations carried on by what were

## WEEKLY STATEMENT OF REPORTING MEMBER BANKS

generally bad banking conditions produced as a result of loans which had been made to them.

A general comparative view of conditions among national banks on June 30 at the close of the fiscal year is afforded in the table on page 91, which reflects the situation of their chief accounts for a series of years last past. Great reductions of capital (about 3 per cent) of loans and discounts (about 12 per cent) and of profits are to be noted. The drift toward consolidations seemed during this poor year to have been accentuated by the weakness of many banks and the effort to gain strength through combination—not, as in former years, largely through desire for mere size or for the stock market profits resulting therefrom.

The figures thus furnished show an unprecedented lessening of loans and investments, which, being analyzed, resolved itself into a shrinkage of \$2,046,000,000 in loans on securities, and a reduction of \$1,035,000,000 in other (commercial) loans, while investments increased \$830,000,000. The net reduction of the asset items taken together, reflected the almost desperate effort of the banks during the latter part of the year to keep "liquid," an effort which they prosecuted by making every possible attempt to cut down the total outstanding supply of accommodation granted by them, and to compel the community to settle all outstanding claims to which the banks were parties, wherever possible. It should be noted, at this point, that during the year brokers' loans, which had, at one time, risen (just before the panic) as high as \$8,000,000,000, had shrunk to less than \$600,000,000 by the close of 1931. The reduction in loans on securities was, in some measure, a further development of the attempt to get the public out of the securities market—or of the public's own disposition to leave that market—but forces of much greater power were also operating to bring about the curtailment of such loans.

Chief among these forces was the continuous lessening of the number of banks, and the selling of the assets of failed banks wherever marketable—a factor which threw upon the bond market in particular great masses of bonds and stocks, with subsequent lessening of their value. Hence by the close of the year, values had tremendously declined, thereby reducing the book valuations of investments wherever banks were in the habit

except to the extent that it was able to pay for and own them in fee simple. It was an extreme and previously never witnessed example, of forced liquidation—one in which the measures applied were of an extraordinary severity.

**STATE BANKS AND TRUST COMPANIES.** There was no reason why State banks and trust companies should prosper better than the rank and file of national banks during the period of the depression. The year 1931, accordingly, proved an unfavorable period for them, with reductions of operations fully comparable to, and moving in about the same proportion as did those of national banks. Decline and difficulty were, in no sense the product of any particular system or set of laws, under which the several banks were organized, but were on the contrary, the outcome of general conditions, and of the reaction in business of every sort. As in the case of the national banks, the State institutions showed considerable increase of investments though not so great an advance as in many former years, while they reported sharp reductions of loans and discounts, especially of those based upon securities. Capital fell off sharply, and undivided profits still more severely, in proportion, thus showing the profitlessness of the business. Deflation—meaning by that term the reduction of credit extended—had probably gone about as far at the end of the year, as it could reasonably be expected to go, granting the existence of the system upon any basis of continuity with existing conditions. Current demand deposits fell off heavily but time deposits were only moderately reduced; in about the same proportion as in the national banking system. The accompanying table reflects the general conditions in the State system at the middle of the year. Later developments during the latter part of the calendar year tended to reveal all the factors just referred to, in an aggravated light, with failures heavier, and reductions of items in the balance sheet even more noteworthy than at midyear.

The general conditions in commercial banking evidenced a general withdrawal of the banks from the support of the business community, and an effort to resort to all possible means for mere self-preservation, with trade and business connections ruthlessly sacrificed, both in domestic and foreign trade. The situation affecting State banking is statistically represented in the accompanying brief tabulation.

PRINCIPAL ITEMS OF RESOURCES AND LIABILITIES OF STATE (COMMERCIAL), SAVINGS, PRIVATE BANKS, AND LOAN AND TRUST COMPANIES  
[In thousands of dollars]

Items	1926	1927	1928	1929	1930	1931

\* Including overdrafts.

of revaluing securities to coincide with market values, while again the attempt of banks to compel holders of securities behind loans to sell out because of no abstract considerations, but merely because they themselves needed funds, was an even more effective influence in the entire situation. The public, in short, was being asked not merely to get out of the stock market, but also to surrender its holdings of bonds and stocks

**FEDERAL RESERVE BANKS.** Federal Reserve Banks had been practically out of adjustment with member banks, and with the business community, up to the end of the year 1930, and during the earlier months of the year under review there was some effort on their part to get into closer alignment. There was also an attempt to assist banks, in the uncomfortable circumstances that presented themselves during the first six

months. These attempts were sporadic; and, uncertain as they were, had but little effect during the forepart of the year due to the uneasy feeling on the part both of banks and business houses, that something radically wrong existed in the general financial mechanism. These fears centred round the status of the immense volume of German so-called short-term obligations which had been absorbed by the banks of the United States, largely on the basis of assurances from many financial authorities that the paper was good, and could be relied upon as a constituent in bank portfolios. A rude awakening occurred at the end of June, when President Hoover became convinced that Germany would not be able to continue payment of reparations obligations and so requested other countries for a general moratorium for the period of one year. This suggestion was promptly acted upon, but involved serious consequences to banks in the United States and in Great Britain (less severe elsewhere) owing to the fact that they had absorbed such large quantities of German paper in the belief that it was liquid. A special international committee of bankers met at Basel during the late summer under the chairmanship of Albert H. Wiggin and issued a report practically admitting that Germany had for a good while "borrowed short" but lent or invested "long"; with the result that the so-called short-time loans were frozen. This was followed by a large central bank credit provided by the central banks of England and France, and shared in by the Federal Reserve System to the extent of \$25,000,000 each. This effort made to prevent international financial collapse was unsuccessful, and was shortly followed by the abandonment of the gold standard in Great Britain, due to the heavy demands for gold which the Bank of England had had to meet. Prior to this event, in the endeavor to save the position of England, the Bank of France and the Federal Reserve System had each provided an exchange fund of \$125,000,000, while in each country a private credit amounting to \$200,000,000 had been opened. These were speedily exhausted with the result indicated above. The next in the series of events was the endeavor of sundry foreign countries to compel the United States to liquidate as much of their foreign investments here as possible and in this experiment about \$714,000,000 was withdrawn in gold during October and early November. The effort to drive the United States off the gold standard did not succeed; and some of the gold was, almost at once, put back into American paper and other investments.

The circumstances thus detailed were so remarkable that it is worth while to quote here the brief description of the sequence given by the Secretary of the Treasury in his annual report as follows:

After the middle of September, 1931, there was a rapid outflow of gold from the country, chiefly to continental Europe, particularly France, and an increase in the volume of gold earmarked by Federal Reserve banks for foreign correspondents. During the ensuing month the country's stock of monetary gold decreased by nearly \$600,000,000, which was about \$100,000,000 more than the accessions since the middle of 1930. Foreign interests obtained the funds for the withdrawal of gold through sales of acceptances previously held here for foreign account, through the use of balances held with banks in this country, including Federal Reserve banks, and through the sale of foreign-owned securities in American markets. At the same time, there was continued increase in the domestic demand for currency. The resultant drain on member bank reserve funds oc-

casioned a rapid increase in the volume of reserve bank credit in use, which amounted to \$2,125,000,000 by the middle of October, compared with an average of about \$945,000,000 in June. Member bank discounts increased from an average of about \$190,000,000 in June to about \$630,000,000 at the middle of October. The acceptance holdings of the reserve banks showed an increase of more than \$600,000,000 and United States security holdings an increase of about \$120,000,000 for the same period.

In these circumstances the discount rate of the Federal Reserve Bank of New York was raised from the unusually low rate of 1½ per cent to 2½ per cent on October 9 and to 3½ per cent on October 16. Discount rates were also increased in October at all reserve banks except Atlanta, where a 3 per cent rate remained in effect, and Minneapolis, where the rate was 3½ per cent; at the end of the month the rate was 3½ per cent at all other reserve banks except Richmond and Dallas which had established rates of 4 per cent. At the Federal Reserve Bank of New York buying rates on bills were also increased in the latter part of September and in October. At the middle of October the rate was 3½ per cent on maturities up to 90 days as compared with 1 per cent at the beginning of September.

Open market rates increased somewhat but in mid-October were still at comparatively low levels. Rates on 90-day bankers' acceptances had increased to 2¼-3¼ per cent from seven-eighths per cent in September, and prime commercial paper had increased to 2¼-4¼ per cent from 2 per cent.

The position of the reserve system at the end of the year 1931 is shown in the table appearing on page 94.

**BANK CREDIT.** Brokers' loans had, by the beginning of the year 1931, been greatly reduced below the level attained at the time of the panic, but there was still much to be done before they could be said to be anywhere near normal. Accordingly, the curtailment of these loans went on practically from the beginning of the year. This reduction was at first orderly, and was made under the pressure of a moderate sort exerted by the banks which at last felt the urgent need of lessening the volume of speculation. By the end of spring, there had been a curtailment to about the level which had been pointed out by most observers as "normal." But this point had hardly been reached when the series of remarkable events just briefly sketched began to take place, and the pressure of failed bank assets upon the market became severe. The result of these conditions was to accentuate the speed of retirement from the market, owing to fears that values would be still further reduced, and accordingly there was a steady and even more rapid curtailment of brokers' loans during the summer and autumn below the points that had previously been indicated as likely to mark the limit of downward movement. Operators who had not been out of the market for many years began to retire completely, and to leave all question of trading as a matter for the future. Curtailment was accordingly continuous until a low point was reached, at the close of the year, with \$568,000,000. The detailed figures are furnished in the accompanying table.

BROKERS' LOANS, 1931

Jan. 28	\$1,734,000,000	July 29	\$1,390,000,000
Feb. 25	1,798,000,000	Aug. 26	1,349,000,000
Mar. 25	1,908,000,000	Sept. 30	1,172,000,000
April 29	1,730,000,000	Oct. 28	869,000,000
May 27	1,574,000,000	Nov. 25	751,000,000
June 24	1,406,000,000	Dec. 30	591,000,000

**BANK FAILURES.** Never in financial history had there been so heavy a series of failures among banks as had taken place during the decade from 1921 to 1930, but this was now to be followed by a record-breaking year of failures. Beginning the year 1931 with a fair pros-

## TWELVE FEDERAL RESERVE BANKS COMBINED

## RESOURCES

	Jan. 6, 1933	Dec. 30, 1931	Jan. 7, 1931
Gold with Federal Reserve agents .....	\$2,074,541,000	\$2,090,372,000	\$1,691,189,000

Total liabilities .....	\$5,716,331,000	\$5,985,820,000	\$5,078,228,000
Ratio of total reserves to deposit and Federal Reserve note liabilities combined .....	65.5%	61.9%	76.3%
Contingent liability on bills purchased for foreign correspondents .....	\$269,544,000	\$248,529,000	\$440,326,000

pect for some reduction in bank collapse, the community was obliged to witness, before spring was over, a series of failures of considerable importance, followed, during the early summer, by almost complete collapse of the banking system in Chicago where some 30 failures occurred within the city limits—most of them small institutions but including also a number of banks of considerable size which were absorbed because unable to stand alone. From this, developed other failures of importance in the Midwest; and eventually an epidemic of closings in the South and Southwest and in New England; while important institutions in other parts of the country also collapsed and others called for assistance.

The result was the formation, during October and subsequent weeks, of the so-called National Credit Corporation with a capital nominally about \$500,000,000, made up of banks which bound themselves to contribute the money needed to give relief to other institutions which stood in need. Some little work was done through this medium, but the close of the year still found it only just about ready to call its first

installment of subscribed capital (\$50,000,000), and with bank failures increasing. The dangerous, not to say disastrous, character of the state of things, led to the request of President Hoover during December that Congress appropriate \$500,000,000 for the capitalization of the "Reconstruction Finance Corporation" with an authorized issue of bonds amounting to \$1,500,000,000 all guaranteed by the U. S. Treasury; and having as its primary work the making of loans to hard-pressed banks, insurance companies, railroads, and other "key" institutions. This unusual, not to say unprecedented step, found its only warrant in the fact that something of the kind has been attempted with the so-called War Finance Corporation during and after the World War, while the wholly anomalous character of the business conditions of the time and the circumstances that the banks were apparently less and less able to take care of themselves or to render mutual aid appeared to make necessary the intervention of the government in order to protect depositors from inability to make payments at all, over large tracts of territory in many different sections of the United States.

The accompanying table sketches the progress of the bank failure movement up to the end of the year 1931.

\* Revised.

INTERNATIONAL RELATIONS. As above indicated, the year was one of great disturbance in international financial and banking relationships. The complete suspension of the payment of war debt provided for under the moratorium asked by President Hoover at the end of June was ratified by European governments with little delay, even France requiring only about ten days to take action; and was eventually approved also by Congress on December 22, notwithstanding that in the resolution of ratification there was inserted a proviso that there should be no complete cancellation either now or in the future. The suspension of Germany's payments of reparations was included in the moratorium arrangements, while her inability to settle the short-term bank indebtedness was evident after one or two serious bank failures within the Reich and was recognized by the Wiggin committee at its meeting in Basel already described. Despite the two great international credits referred to above and intended to save the Reichsbank and the Bank of England from disaster, the disruption caused by England's abandonment of the gold standard effectually broke down what remained of the plan of international coöperation between central banks, and consequently left the Bank of International Settlements with little actual work to accomplish since it was now without even the formal duties assigned to it in connection with Reparations collection, while the various hopes entertained in some quarters of its functioning as a real central international bank had perforce to be indefinitely deprived of realization. The closing of the year was thus marked by a lower degree of international coöperation than at any time in the past, while the future was left wholly uncertain. See REPARATIONS AND WAR DEBTS; also FINANCIAL REVIEW; PUBLIC FINANCE.

**BANTU.** See CONGO, BELGIAN.

**BAPTISTS.** In 1931 there were in the United States 14 groups comprised in the denomination known as Baptist, which maintains that baptism should be administered to believers only and generally by immersion. The first Baptist Church in America probably was established by Roger Williams in Providence, R. I., in 1638, although this honor is claimed by the First Baptist Church of Newport, R. I., organized the same year or shortly after. As a result of political differences, and particularly on account of the question of

vention, which, since that time, has functioned not as a new denomination but as an organization for the purpose of directing missionary and general evangelistic work in the white Baptist churches of the Southern States. The National Baptist Convention, representing the Negro churches, was formed in 1880. Other divisions are known as Primitive, General, Regular, and United Baptists.

According to the *American Baptist Year Book*, 1931, there were in the United States in 1930 a total of 53,888 churches of the Northern, Southern, and National (Negro) Baptist conventions, with 49,907 ordained ministers and 2070 local associations. Baptisms during the year numbered 311,404, making the total membership 8,915,785. Sunday schools numbered 46,132, with an enrollment of 5,143,056 pupils. Church property was valued at \$569,091,200, and contributions amounted to \$92,302,175, of which \$76,468,934 was for current expenses and \$15,923,241 for beneficence. The churches are congregational in polity, each church being sovereign as to its own discipline and worship. Applicants for the ministry are licensed to preach by the churches in which the applicants are enrolled as active members.

**NORTHERN BAPTIST CONVENTION.** According to the *Annual of the Northern Baptist Convention*, 1931, this denomination was composed of 37 conventions in 35 States and reported 420 local associations, 8085 churches, 8309 ordained ministers, 57,108 baptisms during the year, 1,438,739 members, 7280 Sunday schools, and 1,140,901 Sunday-school pupils. Church property was valued at \$229,256,700, while contributions for current expenses amounted to \$26,576,270 and for beneficence to \$5,713,400.

The twenty-fourth annual meeting of the Northern Baptist Convention was held in Kansas City, Mo., June 3-8, 1931, the general theme being "Christians in a Changing World." The keynote address was delivered by Dr. A. W. Beaven, president of Colgate-Rochester Divinity School. The officers elected for 1931 were: President, Mattison B. Jones, Los Angeles, Calif.; first vice president, H. T. Sorg, Newark, N. J.; second vice president, G. I. Neal, Huntington, W. Va.; corresponding secretary, Maurice A. Levy, D.D., Pittsfield, Mass.; recording secretary, Clarence M. Gallup, D.D., Providence, R. I.; and treasurer, Orrin R. Judd, New York

City. The next annual meeting was to be held in San Francisco, Calif., from July 12 to 17, 1932.

In 1931 the Northern Baptist Convention maintained 58 educational institutions, including 11 theological seminaries, 6 training schools, 21 colleges, 6 junior colleges, and 14 academies. These institutions in 1930 had 37,300 students, 2553 instructors, 558 buildings, property aggregating \$82,807,500 in value, endowments valued at \$126,951,390, and an annual income for the year of \$17,852,158. The leading denominational papers in 1931 were: *The Baptist* (Chicago); *Watchman-Examiner* (New York City); *Baptist Observer* (Indianapolis); *Baptist Banner* (Parkersburg, W. Va.); and *Baptist Record* (Pella, Iowa). In addition most of the State conventions issued monthly bulletins.

The foreign-mission field of the Northern Baptist Convention included Assam, Burma, South India, Bengal-Orissa, South China, East China, West China, Japan, Belgian Congo, and the Philippine Islands, with 712 missionaries working at 126 stations. In 1929 churches numbered 2311 with 276,408 members; native workers, 10,296; schools, 2635, with an enrollment of 115,446 pupils; and hospitals and dispensaries, 94, with a total of 22,949 in-patients and 313,248 out-patients. The Judson fund of \$1,000,000 for work in Burma was completed by the women of the denomination. The field of the house mission societies included, in addition to the United States and its dependencies, Mexico, the West Indies, Central America, the Canal Zone, and South America. Their greatest activity was among the Negroes, Indians and new Americans. The American Baptist Home Missionary Society celebrated its one hundredth anniversary by sending a covered wagon from Massachusetts to the far West to commemorate the pioneer work of John M. Peck. The denomination also maintained six hospitals, the largest being the New England Baptist Hospital in Boston and the Northwestern Baptist Hospital in St. Paul; 20 homes for the aged; and 15 children's homes.

General headquarters of the denominational organizations are at 152 Madison Avenue, New York City, with the exception of the Home Mission Society, which is at 23 East Twenty-sixth Street, New York City, and the American Baptist Publication Society, which is at 1701 Chestnut Street, Philadelphia, Pa. The unified missionary interests of the denomination are administered by the Board of Missionary Cooperation; and the principal convention affairs are conducted by the executive and finance committees, together with some 25 other committees.

**SOUTHERN BAPTIST CONVENTION.** In the *Southern Baptist Handbook, 1931*, there were reported 18 State conventions, 23,731 churches, 22,932 ordained ministers, 198,579 baptisms during the year, 3,850,278 members, 20,679 Sunday schools, 2,839,183 Sunday school pupils, and 26,079 Baptist Young People's Unions with a membership of 533,976. Contributions totaled \$37,489,021, and church property was valued at \$217,979,116. The receipts of the boards of the convention in 1931 were as follows: Southern Baptist Foreign Mission Board (Richmond, Va.), \$1,030,329; Southern Baptist Home Mission Board (Atlanta, Ga.), \$611,872; Sunday School Board of the Southern Baptist Convention (Nashville, Tenn.), \$1,890,310; and Old Ministers Relief and Annuity Board (Dallas, Texas), \$272,228. The denomination maintained 96 schools and

colleges, including 5 theological schools, 30 senior colleges, 30 junior colleges, and 31 academies, with a total enrollment of 35,411 students, 1976 ministerial students, and 1539 instructors; endowment amounted to \$22,762,777, and property was valued at \$40,767,404. It also reported 28 hospitals (two fostered by the Southern Baptist Convention and 26 by the State conventions), valued at \$15,350,203 and accommodating 76,919 patients during the year; 18 children's homes with a property value of \$6,569,039 and accommodating 4523 children; and 3 homes for the aged.

The annual sessions of the Southern Baptist Convention were held in Birmingham, Ala., May 13-17, 1931. The various boards and agencies of the convention showed still further declines in receipts for the year, bringing about a critical situation. To meet this situation a new agency was launched by the convention, to be known as the Promotion Committee of Southern Baptists, comprising 52 members, and having temporary headquarters at Knoxville, Tenn. The committee sponsored an "Every-Member Canvass" during Nov. 29 to Dec. 6, 1931, with the objective of securing weekly subscriptions for \$40,000,000, of which amount \$9,000,000 was to go to the support of the various missionary, educational, and benevolent enterprises of the convention, while \$31,000,000 was to care for the local work of the churches.

The following officers for the Southern Baptist Convention were elected: William J. McGlothlin, Ph.D., D.D., LL.D., of Greenville, S. C., president; Wm. Cook Boone, Shawnee, Okla., George J. Burnett, Memphis, Tenn., Arch C. Cree, Salisbury, N. C., John J. Milford, Huntsville, Ala., vice presidents; Hight C. Moore, D.D., Litt.D., of Nashville, Tenn., recording secretary; Henry Burnett, of Macon, Ga., recording secretary; Austin Crouch, D.D., of Nashville, Tenn., executive secretary.

**NATIONAL BAPTIST CONVENTION OF AMERICA (NEGRO).** In 1931 the National Baptist Convention of America reported 1320 local associations and 52 State conventions affiliated with it either through direct messengers or representation by letter. There were 21,000 ordained ministers and a membership of 3,582,312. Of this number approximately 50,000 were added by baptism during the year. Organized Sunday schools had increased to 20,722, with an enrollment of 1,622,851 pupils. Contributions from all sources amounted to \$5,250,621.

The 1931 session of the convention was held in Cincinnati, O., September 9-14. The convention accepted a gift of 250 acres of land near Dexter, N. M., on which there were to be built three homes: one for aged ministers, one for orphans, and one for widows. Guadalupe College in Seguin, Tex., was endorsed by the convention as a coeducational institution, to receive support from the National Baptist Convention jointly with the Lynchburg Theological and Missionary Training Seminary. Headquarters of the National Baptist Publishing Board are at 523 Second Avenue, North, Nashville, Tenn.

**OTHER GROUPS.** In addition to several unorganized groups of foreign-speaking Baptists in the United States, there were the following organized bodies: German, Swedish, French-speaking Baptists of New England, Finnish Baptist Mission Union, American Magyar (Hungarian), Italian, Danish, Norwegian, Czechoslovak, Polish, Rumanian, Portuguese, and

Russian-Ukrainian conferences, Spanish-speaking (Mexican) Baptists were well organized in some sections, North and South; and there were unorganized bodies of Chinese and Japanese Baptists. Statistics for these bodies in 1931 were as follows: Churches, 952; ministers, 846; baptisms, 4863; membership, 98,208; Bible schools, 944; Bible-school enrollment, 98,708; property valuation, \$12,656,100; and contributions, \$1,668,436.

Smaller branches of the denomination, differing in various respects from the main branches of the church, included the following Baptists: General Six-principle, Seventh-day, Free Will, United American Free Will (Colored), Free Will (Bullockites), General, Separate, Regular, United, Duck River, Primitive, Colored Primitive, Two-Seed-in-the-Spirit Predestinarian, Independent Baptist Church of America, and American Baptist Association. The total number of members, according to the Federal Census of Religious Bodies of 1926, was 429,955. See also BAPTISTS, FREE.

The Baptist World Alliance, which was organized in 1905, meets every five years. A meeting was held in Toronto, Canada, in July, 1928. The relationship of the World Alliance to the Baptist churches is purely advisory, its purpose being the discussion of interests common to the denomination.

The *Baptist Hand Book for 1931* (British) gave the following statistics of the denomination in 1930:

	Churches	Ministers and Mis- sionaries	Members
America .....	56,331	51,395	8,925,731
Europe .....	8,253	4,860	1,649,471
Asia .....	3,376	1,621	876,784
Africa .....	1,488	412	87,783
Australasia .....	521	436	35,982
Total . . . . .	69,919	58,724	11,075,701

**BAPTISTS, FREE.** A branch of the Baptist denomination, which by 1931 had practically completed its policy of merging with the Northern Baptist Convention. The General Conference of the Free Baptists, the national incorporated organization, however, still preserved its legal existence and powers. This body is of Northern Free Baptists and is not to be confused with other branches, one centring in North Carolina and known as Free Will Baptists and another centring in Texas and Oklahoma and known as both Free Baptists and Free Will Baptists, although the latter body has been and still is in affiliation with the Free Baptists of the North. Estates in which life interests terminated or other entailments were removed were still coming to its treasury. The majority of Free Baptist ministers, churches, and members were included in the enumeration of the Northern Baptist Convention. Alfred Williams Anthony was serving as corresponding secretary and treasurer. See BAPTISTS.

**BAR ASSOCIATION, AMERICAN.** A national association, organized in 1878 to advance the science of jurisprudence, the administration of justice, harmony in legislation, and in the observance of legal precedents throughout the United States, as well as to uphold the legal profession and promote good understanding among its members. The fifty-fourth annual meeting was held in Atlantic

City, N. J., Sept. 17-19, 1931, and was attended by more than 1800 delegates. Preceding the meeting there were held on September 15-16 sessions of the following sections: Criminal law and criminology; judicial; legal education and admissions to the bar; mineral law; patent, trade-mark, and copyright law; public utility law; and also the forty-first annual conference of the commissioners on uniform State laws.

The address of the retiring president, Charles A. Boston of New York, on this occasion was a critical, historical review of the Federal Constitution, entitled "One Hundred and Forty-Two Years of Government under the Constitution of the United States." Notable among the other addresses were those of Sir Lynden Macassey, leader of the Parliamentary Bar of England and Benchers of the Middle Temple, on "The Part Played by Members of the Inns of Court of England in the Formation of the United States"; Maître Fernand Payen, president of the Order of Advocates at the Court of Appeal of Paris, on "True Basis of International Solidarity"; and the Hon. W. D. Herridge, Canadian Minister to the United States, on "The Rights and Ideals of Anglo-Saxon Democracy." James M. Beck, responding to the address of Sir Lynden Macassey, spoke on "A Rounded Half-Century of Good Will" and William D. Guthrie, responding to that of Maître Payen, on "French Impress on the English, American, and Canadian Spirit." John R. Hardin, president of the Mutual Benefit Life Insurance Company, also delivered a timely address on "Some Legal Problems of Life Insurance Companies." A resolution was adopted favoring the appointment of representatives of the Federal Bar to cooperate with the Conference of Senior Federal Circuit Judges, as had been previously suggested by Chief Justice Hughes. The comparative law bureau reported the publication, under its auspices, of the first complete English translation of *Las Siete Partidas*, the great medieval law book of Spain. The association's medal for distinguished service in the cause of American jurisprudence was awarded to Oliver Wendell Holmes, associate justice of the U. S. Supreme Court.

The total membership of the association in 1931 was 27,000. The officers elected for 1931-32 were: Guy A. Thompson of St. Louis, Mo., president; John H. Voorhees of Sioux Falls, S. D., reelected treasurer; and William P. MacCracken, Jr., of Chicago, reelected secretary. Headquarters of the association are at 1140 North Dearborn Street, Chicago, Ill.

**BARBADOS**, bär-bä'döz. A West Indian island colony of Great Britain, lying to the east of the Windward Islands, with an area of 166 square miles and a population at the census of 1921 of 156,312 (estimated Jan. 1, 1930, 170,391), or more than 1000 to the square mile. The capital is Bridgetown, with a population of 13,486. Births in 1929 numbered 5421 and deaths 4016. The 128 primary schools had 23,374 pupils registered in 1929.

The area under cultivation in 1929 was 67,682 acres, of which slightly more than half was devoted to sugar cane. Cotton is the other staple crop. The collapse of world prices of cotton and sugar resulted in severe distress in 1930 and 1931. Fishing and rum distilling are other industries. In the calendar year 1930, imports amounted to £1,731,786 and exports to £1,062,916; trade was chiefly with the United States, the United Kingdom, and Canada. Revenue for

the fiscal year 1930-31 totaled £404,555; expenditure, £429,143; public debt, £663,000. A total of 4,013,562 tons of shipping entered and cleared the port of Bridgetown during 1929. A governor administers the affairs of the island with the assistance of an executive council, an executive committee, a legislative council of nine members appointed by the King, and an assembly of 24 members elected annually by about 5200 registered electors. Governor in 1931, Sir W. C. F. Robertson.

**BARCELONA STRIKE.** See SPAIN under History.

**BARLEY.** The world production of barley in 1931 was one of the smallest recorded in recent years. The production for the year of 32 countries covering over 90 per cent of the world's yield as reported by the International Institute of Agriculture was estimated at 1,111,456,000 bushels, a decrease of 17.7 per cent below the yield of 1,350,303,000 bushels of the preceding year and of 9.2 per cent below the average yield for the five years 1925-29. The area devoted to barley in these countries was reported as 54,573,000 acres, which was 4 per cent below the acreage in 1930 but 5.6 per cent above the average annual acreage for the five-year period. These estimates did not include the Soviet Republics, China, several of the smaller European countries and the countries south of the equator.

The yields of the leading barley-producing countries other than the United States in 1931 were reported as follows: Germany 138,028,000 bushels, Spain 90,129,000 bushels, Japan 76,522,000 bushels, Rumania 70,274,000 bushels, Poland 69,355,000 bushels, Canada 67,972,000 bushels, and France 54,807,000 bushels. Although the European area in barley was greater than in 1930 the production was much below that of the previous year and the average. As in the preceding year Germany ranked first in yield per acre with 34.6 bushels, being closely followed by England and Wales with 34.5 bushels. The barley production of the southern hemisphere averages about 40,000,000 bushels annually. In the crop year 1930-31, Argentina, the leading barley-growing country south of the equator, produced 14,238,000 bushels on a sown area of 1,422,000 acres. For the crop of 1931-32 Argentina sowed 1,439,000 acres which was nearly 23 per cent above the five-year average. The Soviet Republics produced an annual average of 299,770,000 bushels on 17,724,000 acres for the five years 1925-29.

According to estimates published by the Department of Agriculture the barley crop of the United States was 198,965,000 bushels as compared with 304,601,000 bushels the year before. The area harvested in 1931 was reported at 11,471,000 acres as against 12,662,000 acres in 1930. The acreage was generally increased in the eastern and southern States under conditions of favorable spring weather and the need of feed grains, but in the important barley States of the Northwest dry weather at planting time reduced the acreage. The average yield per acre was 17.3 bushels while in 1930 it was 24.1 bushels. On the basis of the average farm price on Dec. 1, 1931, 35.2 cents per bushel, the lowest recorded for many years, the total value of the crop was only \$70,119,000. The leading barley-producing States and their yields were reported as follows: Minnesota 37,480,000 bushels, Wisconsin 19,006,000 bushels, North

Dakota 18,482,000 bushels, South Dakota 16,680,000 bushels, Nebraska 14,091,000 bushels, and California 13,770,000 bushels. In average yield per acre Wisconsin ranked first among these States with 26 bushels. Nearly half of the barley acreage of the country in 1931 was reported from Minnesota, North Dakota, and South Dakota, each State having harvested over 1,800,000 acres. Owing to lowered yields by heat and drouth a greater acreage than usual was cut for hay in the North Central and Western States. During the fiscal year ended June 30, 1931, the United States exported 10,302,000 bushels of barley as compared with 21,544,000 bushels the year before.

**BARNARD COLLEGE.** See COLUMBIA UNIVERSITY.

**BARR, ARCHIBALD.** A British mechanical engineer and inventor, died in Milngavie, Dumbarton-shire, Scotland, Aug. 6, 1931. Born in Glenfield, Renfrewshire, in 1855, he attended Glasgow University, and was professor of civil and mechanical engineering at the Yorkshire College, Victoria University (later the University of Leeds), during 1884-89 and Regius professor of civil engineering and mechanics at Glasgow University during 1889-1913. With Prof. William Stroud he invented naval range-finders which were adopted by the British Admiralty and other powers. Their other inventions included various types of range-finders, height-finders for anti-aircraft service, electrical and mechanical fire control instruments, torsion dynamometers and power meters, and a photogrammetric platter and other instruments for use in air surveying. At the time of his death he was chairman of the engineering firm of Barr & Stroud, Ltd., Glasgow. He was also past president of the Royal Philosophical Society of Glasgow, of the Institution of Engineers and Shipbuilders in Scotland, and of the mechanical science section of the British Association for the Advancement of Science.

**BARRINGTON, E.** See BECK, L (ILY) ADAMS.

**BARBUS, CLARA.** An American physician and author, died in Scarsdale, N. Y., Apr. 5, 1931. She was born in Port Byron, N. Y., Aug. 8, 1864, and was graduated with the M.D. degree from Boston University in 1888. After engaging in general practice in Utica, N. Y., from 1889 to 1893, she became assistant physician at the Middletown (N. Y.) Hospital for the Insane and later conducted a private sanatorium in Pelham, N. Y. On her retirement from active practice in 1914 she devoted most of her time to lecturing and writing. She was associated for many years with John Burroughs, the naturalist, and following his death in 1921 became his literary executor and biographer. Among her works are *The Retreat of a Poet Naturalist* (1905); *Our Friend John Burroughs* (1914); *John Burroughs, Boy and Man* (1920); *Life and Letters of John Burroughs* (1925); and *Whitman and Burroughs: Comrades* (1931). She also edited Burroughs's posthumous works, *Under the Maples* (1921) and *The Last Harvest* (1922), and *The Heart of Burroughs's Journals* (1928).

**BASEBALL.** One of the most spectacular and dramatic World's Series in the history of the sport was the highlight of baseball in 1931, which up to the autumn series had been one of the most drab and uninteresting campaigns in many years. The two pennant races in the American and National Leagues had been easily won by the Philadelphia Athletics in the former and

the St. Louis Cardinals in the latter. The New York Yankees and the Washington Senators threatened the rule of the world's champion Athletics for a while but both teams were unfit to cope with the magnificent power of the Philadelphia team. The New York Giants pressed the Cardinals for a few months but fell behind in face of a fine late season spurt. The Brooklyn Robins, considered almost certain winners at the start of the campaign in April, and the Chicago Cubs, managed by Rogers Hornsby, fell apart. The Robins never got started and fell under the burden of too much pre-season praise. The Cubs were riddled by internal trouble and by the failure of Hack Wilson, heavy hitter and home run king in 1930, to do anything worth while at bat.

At the start of the World's Series it was confidently expected that the Athletics would continue their mastery over the National League, which was asserted in 1929 and 1930. The odds were high that Connie Mack, manager of the Athletics, would be the first major league manager to capture three consecutive World's Series. When this team won the first game the odds went higher. Then followed remarkable feats with Pepper Martin, an unknown Cardinal outfielder, wreaking havoc with his bat. The Cardinals finally won out. In the last game Burleigh Grimes, the ancient St. Louis spitball pitcher, faltered after a splendid exhibition in earlier games and it was only the relief work of Bill Hallahan, who had twice beaten the Athletics, that saved the day and brought the triumph to St. Louis.

In February the two major leagues acted to curb heavy hitting by adopting a ball of less lively characteristics. This produced an appreciable reduction in home runs, with Babe Ruth and Lou Gehrig, Yankees, finishing on top with 40 home runs each. Al Simmons, Philadelphia Athletic outfielder, won the American League batting crown after a tussle with Ruth, and Chick Hafey, Cardinal player, beat out Bill Terry, New York first baseman and 1930 champion, for honors in the senior circuit. Robert Moses (Lefty) Grove, sturdy member of the Athletics pitching staff, was the hurling star of the campaign. He won 31 games and lost only four for an average of 886, the highest since 1900. Grove was the first left hander in the history of baseball to win 30 games in a season.

Rochester won the International League pennant and defeated St. Paul of the American Association in the Little World's Series. Harrisburg won the New York-Pennsylvania League championship. Hartford, a Brooklyn Robins farm, won both halves of the Eastern League race. San Francisco, winner of the second half of the Pacific Coast League split-season schedule, toppled Hollywood, winner of the first half, in the playoff.

In the colleges, Pennsylvania won the Eastern Intercollegiate League championship behind the masterful pitching of Walter Masters. Yale beat Princeton in two out of three games and beat Harvard by a similar margin. The University of Illinois won the Big Ten Conference race.

The deaths of four important men in baseball circles marred the season. Ernest S. Barnard, president of the American League, and Ban Johnson, former president, died within a few days of each other and the whole baseball world mourned the loss. Charles Comiskey, the "old Roman" whose name had been synonymous with

the Chicago White Sox for years, and Garry Herrmann, onetime owner of the Cincinnati Reds and president of the National Commission, were others who died during the year.

**BASEL ADVISORY COMMITTEE.** REPORT OF. See REPARATIONS AND WAR DEBTS; GERMANY under *History*.

**BASKETBALL.** Basketball reached higher planes in every respect in 1931. The attendance figures were shattered as excellent teams faced each other, especially when charity tournaments were played. The art of the game reached near to perfection with St. John's College of Brooklyn five, and the game received greater publicity than ever before when it was enshrouded in scandal at the end of the season when many of the players of Metropolitan college teams were banned because of professionalism. The largest basketball crowd—17,000 persons—in the history of the sport in the East watched Fordham, St. John's, Manhattan, C. C. N. Y., Columbia and New York University play in a tournament for the benefit of the unemployed at Madison Square Garden in New York in January. The triple-header brought many thousands of dollars to the fund, and added greatly to the general popularity of the game.

The St. John's team, a veteran five, well coached, won twenty-one games in a hard twenty-two game schedule against the best teams in the East. The Brooklyn team featured passing and a well designed attack that baffled all opponents by its feats of legerdemain. The regularly scheduled game between St. John's and C. C. N. Y. in Brooklyn early in the season drew 12,000 spectators. The Manhattan College team, Pittsburgh, and Syracuse and Buffalo were other strong quintets performing on Eastern courts. Columbia, a strong five, won the Eastern Intercollegiate League race for the second consecutive time, winning all ten of its league games, and only losing two games during the entire season.

Northwestern won the Big Ten Conference title for the first time in history, losing only one conference battle. The University of Washington five gained the college honors on the Pacific Coast. The "Huskies," winners of the Northern Division championship of the Pacific Coast Conference, defeated the University of California, winners of the Southern Division race, in a three game final. Utah University won the title in the Rocky Mountain Conference, and Kansas captured the laurels in the Big Six. Maryland, defeating Kentucky at Atlanta, won the Southern Conference championship.

The Henry Clothiers of Wichita, Kansas, won the National A.A.U. tournament held at Kansas City. This was the second straight triumph in this tournament, which drew thirty-nine competing teams, for the Clothiers. The professional ranks were hard hit by the depression and after a shortening of the league schedule and much splitting up of the teams, the Brooklyn Visitations won the title by downing Fort Wayne in the final series.

**BASQUE PROVINCES.** The four Spanish Provinces of Guipúzcoa, Navarra, Alava, and Vizcaya (Biscay), adjoining France at the angle of the Bay of Biscay. With an area of 6794 square miles, the Basque Provinces had an estimated population of 1,183,520 on Jan. 1, 1930. A separate people with a culture and language distinct from that of the rest of Spain, the Basques enjoyed virtual autonomy under the King of Castile until 1839. Their leading cities

are Bilbao, San Sebastian, Vittoria, and Pamplona. Sea fisheries, iron mining, and agriculture are the principal industries. For political developments in 1931, see *SPAIN* under *History*.

**BATES COLLEGE.** A nonsectarian college for men and women in Lewiston, Me., founded in 1864. The enrollment for the autumn term of 1931 was 712, of whom 436 were men and 276 women. In the 931 summer session there was a total of 320 students, of whom 148 were men and 172 women. The faculty and administrative officers numbered 57. The permanent funds amounted to \$1,862,000; total expenditures for the fiscal year were \$319,198; and the budget involved an appropriation of \$310,320. The library contained approximately 60,000 volumes. President, Clifton Daggett Gray, Ph.D., LL.D.

**BATTLE CRUISER.** See *NAVAL PROGRESS*.

**BATTLE OF YORKTOWN ANNIVERSARY.** See *CELEBRATIONS*.

**BATTLESHIP.** See *NAVAL PROGRESS*.

**BAVARIA.** A constituent state of the German Republic; formerly a kingdom within the German Empire. Area, 29,334 square miles; population, according to the census of 1919, 7,055,466; according to the census of 1925, 7,379,594. Chief cities: Munich, the capital, with a population of 680,704 in 1925; Nuremberg, 392,494; Augsburg, 165,522; Ludwigshafen, 101,869. Births in 1929 numbered 149,816, deaths 100,240, marriages 63,512. The religious division of the population of Dec. 1, 1925, was: Roman Catholic, 5,165,013; Protestants, 2,110,086; Jews, 49,163. Education is compulsory between the ages of 6 and 16. The public elementary schools in 1929 numbered 7726, with 798,083 pupils.

Agriculture and mining are the chief industries. About one-half the total area is under cultivation, the principal crops in 1929 being: Wheat, 482,063 metric tons; rye, 663,791 tons; oats, 707,848 tons; barley, 674,058 tons; potatoes, 5,792,890 tons. The wine yield was 10,876,447 gallons. In the same year the coal output was 2,211,859 metric tons; iron ore, 615,518 tons; pig iron, 291,403 tons; cast iron, 206,651 tons; and sulphuric acid, 420,899 tons. In the ordinary budget for 1930 revenues were estimated at 835,604,690 marks and expenditures at 857,404,690 marks; the extraordinary budget balanced at 94,732,958 marks. The public debt at the beginning of 1930 totaled 1,306,852,000 paper marks and 395,352,858 Reichsmarks (Reichsmark and mark both exchanged at about \$0.2385 in 1930).

The constitution dates from Aug. 14, 1919. Under it, the supreme power is vested in the people, who are represented by the Diet (Landtag) of one Chamber elected for four years. The membership of the Landtag, as constituted following the election of May 20, 1928, follows: Bavarian People's party, 46; Social Democrats, 34; National Socialists, 9; German Nationalists, 13; Bavarian Peasants' and Middle-Class Union, 17; German People's party, 4; Communists, 5. See *GERMANY*.

**HISTORY.** In response to an emergency appeal by the German Reich for cooperation in meeting the national financial crisis, the State Government on Aug. 27, 1931, issued a decree calculated to wipe out the budget deficit of about \$7,000,000. Taxes were increased, the salaries of government employees slashed, the building programme curtailed, the hours of school teachers increased, and other economy measures effected.

**BAYREUTH-WAGNER FESTIVAL.** See *MUSIC*.

**BEAUCHAMP, WILLIAM BENJAMIN.** A bishop of the Methodist Episcopal Church, South, died in Richmond, Va., June 28, 1931. He was born in Farnham, Va., Mar. 10, 1869, and was graduated from Randolph-Macon College in 1890. Ordained to the ministry of the Methodist Episcopal Church, South, he served successively, from 1891 to 1903, as pastor of the Broad Street and St. James's Churches in Richmond, Va. He then filled charges in Newport News, Va., Louisville, Ky., Danville, Va., and Portsmouth, Va., until his appointment in 1917 as general secretary of the Laymen's Missionary Movement of the Methodist Episcopal Church, South. He was elected bishop in 1922, and for four years was in charge of the 12th episcopal district comprising missions in Europe. At the time of his death his district included Georgia and Mexico. He had been a member of the theological faculty at Emory University since 1926, and represented the Methodist Episcopal Church, South, on the executive committee of the Federal Council of the Churches of Christ in America. He was also president of the board of missions of the Virginia conference from 1911 to 1919, foreign secretary for Europe of the Methodist Episcopal Church, South, in 1919, president of the World Brotherhood Federation in London in 1925, and president of the Board of Missions of the Methodist Episcopal Church, South, in 1926. As director-general of the missionary centenary drive of the Methodist Episcopal Church, South, in May, 1919, he raised \$50,000,000 in an eight-day campaign.

**BEAUHARNOIS SCANDAL.** See *CANADA* under *History* and *Shipping*.

**BEAUX-ARTS INSTITUTE OF DESIGN.** A school of fine arts in New York City, planned after the École des Beaux-Arts in Paris. It was organized in 1916 by the Society of Beaux-Arts Architects for the purpose of furnishing "instruction in the arts, under the Regents of the State of New York, at a minimum cost to students; to bring art students under the criticism of artists who are engaged in active practice; to carry students beyond the academic study of the arts into the province of their application and practice; and to bring about coöperation among the various art schools of the country." Working under the auspices of the institute during the year 1930-31 were 2656 architectural students, 190 students of sculpture, and 117 students of mural painting.

Prizes in architecture, sculpture, and mural painting are offered to students throughout the United States. During the year 1930-31, the committee on education in the department of architecture conducted 36 competitions for the study of architecture and six for the study of archaeology. The most important of the various prizes and scholarships offered to students through the institute is the Paris Prize amounting to \$3600, given by the Society of Beaux-Arts Architects, which affords two and one-half years' study in architecture at the École des Beaux-Arts in Paris. There is also the Paris Prize in Sculpture, representing a scholarship of \$1200 for one year's study in Paris.

The institute issues a monthly *Bulletin*. The officers elected at the annual meeting in November, 1931, were: Director, Whitney Warren; secretary, Henry R. Sedgwick; director of archi-

tectural department, Ely Jacques Kahn; director of department of sculpture, Edward McCartan; director of department of mural painting, J. Monroe Hewlett; chairman of the board of trustees, Benjamin W. Morris; vice chairman, William Adams Delano. Headquarters are at 304 East Forty-fourth Street, New York City.

**BECHUANALAND PROTECTORATE**, béch'oo-ä'nä-länd'. A British protectorate in South Africa. Area, about 275,000 square miles; population (census of 1921), 152,983, including 1743 Europeans. Cattle rearing and primitive agriculture are the chief occupations. Some gold and silver is mined. Revenue in 1929-30 amounted to £146,384; expenditure to £155,822. Budget estimates for 1930-31 were: Revenue, £154,420; expenditure, £154,566. The colony is administered through the native chiefs by a resident commissioner under the High Commissioner for South Africa. Resident Commissioner in 1931, Lieut.-Col. C. F. Rey.

**BECK, L(ILY) ADAMS** (pseudonym, E. BARRINGTON). British author, died in Kyoto, Japan, Jan. 3, 1931. During her long sojourn in various parts of Asia, including Little Tibet, Japan, and China, she studied Oriental philosophy, interpreting it to the Western mind in such books as *The Key of Dreams* (1922); *The Perfume of the Rainbow* (1923); *The Splendour of Asia* (1926); *The Story of Oriental Philosophy* (1928); *The Way of Power: Studies in the Occult* (1928); *Openers of the Gate: Stories of the Occult* (1930); *The Way of Stars* (1930); and *The Ninth Vibration* (1930). She was best known, however, for the novelized biographies, written under her pseudonym, in which she recaptured the glamour of a romantic past. These include: *The Ladies* (1922); *The Chaste Diana* (1924); *The Divine Lady* (1924); *Glorious Apollo* (1925); *The Exquisite Perida* (1926); *The Thunderer* (1927); *The Empress of Hearts* (1928); *The Laughing Queen* (1929); *The Duel of the Queens* (1930); and *The Irish Beauties* (posthumous, 1931).

**BEDE, VENERABLE**. See PHILOLOGY, CLASSICAL.

**BEDFORD, SIR CHARLES HENRY**. A British chemist, died in Woking, Surrey, July 8, 1931. He was born in Edinburgh June 19, 1866. Educated at the University of Edinburgh, he entered the Indian Medical Service in 1889, serving as chemical examiner to the Government of India and to the Bengal and Punjab Governments. He was professor of chemistry at the Calcutta and Lahore Medical Colleges, and was president for India of the 6th International Congress of Applied Chemistry held in Rome in 1906. During 1905-06 he was scientific and technical adviser to the Indian Excise Committee and conducted the government of India's investigation into the quality, manufacture, and excise-control of alcoholic liquors in India. He also originated the Central Excise Laboratory for India, of which he was director from 1906 to 1911. On his return to England in 1911 he was appointed deputy chief commissioner of medical services for the Ministry of National Service in London. He founded, in 1926, the King Alfonso XIII chair of Spanish studies at Oxford University, in commemoration of the Prince of Wales's South American visit, and in 1930 became honorary director of the Anglo-Spanish and Spanish-American Institute of London. He was knighted in 1911, and in 1929

was created a Knight of the Grand Cross of the Order of Civil Merit of Spain in recognition of his work.

**BEEF SUGAR**. See SUGAR.

**BELASCO, DAVID**. An American playwright and manager, died in New York City, May 14, 1931. He was born in San Francisco, Calif., July 25, 1854, and began his career as an actor at the Metropolitan Theatre in that city in 1874. Showing talent, however, in the writing and adaptation of plays, he soon found a wider field. One of his early successes was *Hearts of Oak* (1880), in which he toured with James A. Hearn. Moving to New York City in 1880, he was for a time stage manager of the Madison Square and Lyceum Theatres, becoming manager of his own theatre in 1902. He collaborated with Henry C. De Mille in writing *The Wife* (1887) and *The Charity Ball* (1889), and also wrote for E. H. Sothern *Lord Chumley* (1887). In 1893 he produced *The Girl I Left Behind Me*, which he wrote with Franklin Fyles, and in 1895, *The Heart of Maryland*, a melodrama of the Civil War in which Mrs. Leslie Carter appeared. Among his other plays are *La Belle Ruase* (1881); *May Blossom* (1884); *Valerie* (1886); *Men and Women* (1890); *Naughty Anthony* (1899), in which he first presented Blanche Bates; *Madame Butterfly*, a dramatization of John Luther Long's story (1900); *Du Barry* (1901); *The Darling of the Gods* (in collaboration with John Luther Long, 1902); *Sweet Kitty Bellairs* (1903), in which Henrietta Crosman appeared; *Adrea* (with John Luther Long, 1904); *The Music Master* (with Charles Klein, 1904); *The Girl of the Golden West* (1905); *The Rose of the Rancho* (with R. Walton Tully, 1906); *A Grand Army Man* (with Pauline Phelps and Marion Short, 1907); *The Return of Peter Grimm* (1911), in which David Warfield had the title rôle; and *Van der Decken* (1915).

From 1910 on, through his extraordinary skill in training his actors and his minute attention to the mechanical details of lighting and stage setting, Belasco became better known as a successful manager-producer of the works of other dramatists. His later successes included *Tiger! Tiger!* (with Frances Starr, 1918); *The Gold Diggers* (with Ina Claire, 1919); *Deburau* (with Lionel Atwill, 1920); and *Kiki* (with Leonore Ulric, 1921). He also presented David Warfield in *The Merchant of Venice* (1922); Fay Bainter in *The Other Rose* (1923); Robert Lorraine in *Tiger Cats* (1924); Holbrook Blinn and Judith Anderson in *The Dove* (1925); Leonore Ulric as "Lulu Belle" (1926) and in *Mima* (1928); and Helen Gahagan in *To-night or Never* (1930).

**BELDEN, CHARLES FRANCIS DORR**. An American librarian, died in Pittsfield, Mass., Oct. 24, 1931. He was born in Syracuse, N. Y., Oct. 5, 1870. On graduation from the Harvard Law School in 1898, he served as secretary to the law faculty until 1902, when he became assistant librarian of the Harvard Law Library. In 1908 he was appointed librarian of the Social Law Library in Boston, and the following year librarian of the Massachusetts State Library and chairman of the Free Public Library Commission of Massachusetts. After 1917 he was director of the Boston Public Library. He was president

of the American Library Association during 1925-26, and in 1930 was created a Knight of the Order of the Crown of Italy for his work in Italian arts and letters.

**BELGIAN CONGO.** See CONGO, BELGIAN.

**BELGIUM.** A kingdom of Western Europe, situated between France and the Netherlands. Capital, Brussels; monarch in 1931, Albert I.

**AREA, POPULATION, ETC.** The total area, including the districts of Eupen and Malmédy, which were ceded to Belgium by the Treaty of Versailles, is 11,755 square miles. The population, according to the official census of 1920, was 7,465,782; estimated Jan. 1, 1930, at 8,060,189, which represented a density of 686 per square mile. The chief cities with their populations as of Jan. 1, 1930, are Brussels (with suburbs), 833,345; Antwerp, 209,190; Liège, 168,280; Ghent, 170,095. In 1929, births totaled 146,206; deaths, 120,782; marriages, 71,811. The excess of births over deaths was 25,424 (41,060 in 1928). Emigration in 1929 totaled 29,162 (28,303 in 1928); immigration, 55,595 (41,977).

**EDUCATION.** In 1929, there were 8452 elementary schools, with 835,347 pupils; 3872 infant schools, with 248,399 pupils; 35 royal and special atheneums, with a total of 8346 pupils; 4 communal and provincial colleges, with 1853 pupils; 11 private colleges, with 1500 pupils; 137 higher state schools, with 26,380 pupils; 15 higher communal and provincial schools, with 4591 pupils; and 8 private higher schools, with 1146 pupils. Numerous other private and free schools were under ecclesiastical or other care. The four universities, with the attendance in 1928-29, are: Brussels, 2051; Ghent, 1650; Liège, 2458; and Louvain, 3755. Ghent and Liège are state institutions. In October, 1930, Ghent became a Flemish-speaking institution. Instruction is in French or Flemish, or both.

**PRODUCTION.** Agriculture, mining, and manufacturing are equally important factors in the national economy, enabling Belgium to support one of the densest populations of Europe. Considerable quantities of foodstuffs are imported. Of the total area, 3,222,000 acres, or 43 per cent, were under cultivation in 1929; in addition there were 1,301,000 acres of permanent meadows and pastures, and 167,000 acres of orchards. Woods and forests covered 18 per cent of the total area.

#### BELGIUM'S CROPS: AREA AND PRODUCTION

<sup>a</sup> Thousands of acres.

<sup>b</sup> Thousands of units—bushels except as indicated.

<sup>c</sup> Unit, metric ton.

\* Seasons ended following year.

<sup>d</sup> Unit, pound.

Livestock at the beginning of 1930 included 1,738,348 cattle, 1,237,002 swine, and 249,014 horses. The area and production of the principal crops in 1929 and 1930 are shown in the accompanying table from the *Commerce Yearbook*.

The large metallurgical industries of Belgium and Luxemburg depend principally upon exports, which declined continuously through 1930 and 1931. Exports of all metals and metal products in 1930 totaled 4,612,000 metric tons, valued at 6,885,238,000 francs, as compared with 5,199,000 tons, valued at 7,701,619,000 francs in 1929 (1 franc equals \$0.02784). The Belgian production of metallurgical products declined in about the same ratio, the figures for 1930, with 1929 in parentheses, being as follows: Pig iron, 3,403,000 metric tons (4,096,000); crude steel, 3,370,000 metric tons (4,128,000); finished steel, 2,793,000 metric tons (3,566,000). In 1931, the metallurgical industries kept production at approximately the 1930 level, although exports declined somewhat and prices declined about 25 per cent. Production of the other leading mining and manufacturing industries in 1930, with comparative figures for 1929, was as follows: Coal, 27,406,000 metric tons (26,931,000 in 1929); coke, 5,361,000 metric tons (5,991,000); briquets, 1,902,000 metric tons (1,990,000); crude zinc, 178,000 metric tons (202,000); window glass, 41,389,000 square yards (73,750,000); plate glass, 2,921,000 square yards (4,542,000); paper and cardboard, 172,724 metric tons (190,210); cotton yarn, 143,299,000 pounds (162,038,000); conditioned wool, 66,458,000 pounds (87,357,000); rayon, 12,346,000 pounds (15,000,000).

Belgian industries, particularly coal and cotton textiles, reflected the adverse effects of the world depression during 1931. But due to conservative policies, the reduction of overhead, and the existence of substantial reserves, industry in general withstood the strain better than in most industrial countries. Wages were cut from 15 to 20 per cent during 1931, but without serious labor disturbances, the reductions for the most part following changes in the cost-of-living index, in accordance with agreements between employers and employees. In September, 1931, there were 70,893 insured workers completely out of work and 120,669 were on part time, as compared with 81,750 wholly unemployed and 121,906 on part time in February, 1931.

**COMMERCE.** Belgian exports in 1930 declined to \$729,700,000 from \$883,200,000 in 1929, while imports fell to \$859,600,000 from \$984,600,000 in the previous year. The principal export commodities, by value, in 1930, were: Iron and steel, \$139,631,000 (\$165,227,000 in 1929); textiles, \$92,921,000 (\$114,150,000); precious stones, \$35,364,000 (\$57,379,000); coal, coke, briquets, \$29,967,000 (\$28,377,000); glass and glassware, \$28,363,000 (\$42,026,000); wool, \$24,322,000 (\$37,524,000); crude copper, \$21,051,000 (\$12,747,000); and machinery (other than electric), \$20,339,000 (\$22,364,000).

France remained the leading source of Belgian imports in 1930, furnishing 17.8 per cent of the total, as compared with 19.5 per cent in 1929. Germany supplied 16.7 per cent of the imports (13.9 in 1929); the Netherlands, 13 (11.7); the United States, 10 (9.5); and the United Kingdom, 9.2 (11.1). The United Kingdom was again the chief export market, taking 19 per cent of all shipments (18.3 per cent in 1929). France took 15.7 per cent (12.6); the Netherlands, 13.2 (12.6); Germany, 11.3 (11.9); and the United States, 5.1 (6.8). In 1931, according to preliminary estimates, exports declined about 11 per cent in value and imports about 24 per cent, as compared with exports and imports in 1930.

**FINANCE.** In the 1930 ordinary and extraordinary budget estimates, revenues were calculated at 11,562,000,000 Belgian francs (\$321,424,000) and expenditures at 11,514,000,000 francs (\$320,089,000). Actual preliminary returns for the (calendar) year showed a deficit of 1,175,000,000 francs (about \$32,600,000), or 9 per cent of the total expenditures. Expenditures were above estimates, especially for pensions, public works, labor, and industry. Revenue, on the other hand, fell below the estimates, particularly from taxes on transfers and inheritance. The tax rates, too, had been lowered after the passage of the budget.

Budget estimates for 1931 (ordinary and extraordinary) placed revenues at 11,685,000,000 francs and expenditures at 12,305,000,000 francs. By the end of August, 1931, revenue from direct and indirect taxation was 1,232,779,826 francs under the budget estimates. To eliminate the threatened deficit for the year, Parliament in July imposed new taxes calculated to bring in an additional 1,300,000,000 francs annually. At the same time the government was authorized to borrow 1,000,000,000 francs to meet urgent needs.

The public debt on Jan. 1, 1930, was 52,033,556,000 Belgian francs, of which 24,305,543,000 francs represented the internal and 27,668,013,000 francs the external long-term debt.

**COMMUNICATIONS.** The state-owned but privately managed railway system in 1930 reported 2997 miles of main line; in addition there were 189 miles of private railways and 1048 miles of provincial lines. In the same year, highways extended 18,894 miles, of which 2237 miles were macadam; the highways for the most part were paved with stone. Navigable rivers and canals totaled 1043 miles. Construction of the Albert Canal, to link Antwerp directly to the River Meuse at Liège, was started in 1930. The task was expected to take eight years and to cost nearly \$40,000,000. The Belgian merchant marine at the beginning of 1930 consisted of 170 vessels of 360,985 tons, of which 149 ships of 320,683 tons were steamers. In 1929, a total of 19,057 vessels, of 29,753,385 tons, entered Belgian ports and 19,064, of 29,631,291 tons, cleared. A Belgian air service links Brussels, Ostend, and Antwerp.

**GOVERNMENT.** Belgium is a constitutional, representative, and hereditary monarchy. Executive power is in the King, acting through a responsible ministry; legislative power is in the King and two chambers, namely the Senate and House of Representatives. The former is elected partly by the direct and partly by the indirect vote of the people, the number being proportionate to the population of each Province. Those elected indirectly are chosen by the provincial councils. Following the election of May 26, 1929, the composition of the Senate was: Catholics, 71; Socialists, 56; Liberals, 23; Frontists, 4. The Chamber of Deputies was composed as follows: Catholics, 77; Socialists, 70; Liberals, 28; Frontists (Flemish autonomist party), 11; Communists, 1. The Ministry, as reorganized Dec. 4, 1929, included: Prime Minister, Henri Jaspar (Catholic); Foreign Affairs, Paul Hymans (Liberal); Justice, M. Janson (Liberal); Education, Maurice Vauthier (Liberal); Finance, Baron Houtart (Catholic); Agriculture, Home Affairs, and Hygiene, Henri Baelis (Catholic); Industry, Labor, and Social Insurance, M. Heyman (Christian Democrat); Railways, Marine,

and Aëronautics, M. Lippens (Liberal); National Defense, Comte de Broqueville (Catholic); Colonies, Henri Jaspar (Acting); Posts and Telegraphs, M. Forthomme; Public Works, M. Van Caenegem.

## HISTORY

**COLLAPSE OF THE CABINET.** After nearly five years in office, Premier Jaspar's Catholic-Liberal Coalition Government was forced to resign on May 21, 1931, due to the defection of the Liberals. Both the government's national defense policy and the French-Flemish language dispute—the two major political issues confronting the nation—were involved in the overthrow of the Cabinet. The Liberals, mainly French-speaking, strongly favored the fortification of the eastern frontier, in compliance with the Franco-Belgian military agreement of 1920, and vigorously defended the position of French-speaking minorities in predominately Flemish districts. They withdrew their support from Premier Jaspar when, without consulting them, he yielded to the demand of the Socialist and Flemish deputies for a reduction in military appropriations.

It was not until June 5 that a new Cabinet was formed by Jules Renkin, a leader of the Catholic party, who assumed the posts of Premier and Minister of Interior. The Renkin Ministry consisted of seven Catholics and five Liberals, Catholics with Flemish leanings being in the majority. M. Hymans continued as Foreign Minister. The other important members were: Baron Houtart, Minister of Finance; M. F. Cocq, Justice; Henri Weyman, Industries; M. P. Crokaert, Colonies; and M. J. Van Caenegem, Public Works. The Cabinet won a vote of confidence (95 to 77) on June 18, but it evoked little popular enthusiasm. The increasing recognition accorded Flemish language claims was indicated when Premier Renkin, in his Ministerial declaration, addressed the Chamber in both French and Flemish. With the exception of this conciliatory attitude toward the Flemish groups, there was little change in internal or external policies as a result of the Cabinet overturn. The Renkin Government reintroduced the fortifications bill calling for the original appropriation of \$6,000,000, and it was passed on June 24.

**OTHER DEVELOPMENTS.** The Socialist campaign for abrogation of the Franco-Belgian defensive pact, the demand of the Walloons that the fortification of the eastern frontier be extended to protect their section (the southern part) of the country, and the language problem in the secondary schools were the primary political issues before Parliament throughout the year. The serious trend which the rift between the Flemish- and French-speaking populations was taking was emphasized when delegates from all the French-speaking districts meeting at Liège October 18 approved a plan for a federal constitution, dividing Belgium into two autonomous regions on a linguistic basis. On October 15, the Liberal party voted to revise its platform in favor of the territoriality of languages. Under this system, the study of a second national language would be elective, rather than compulsory, in both the French and Flemish sections of the country. The decision, which was supported by the government, virtually blocked the introduction of compulsory Flemish in the French-speaking districts. Seemingly, it insured a grow-

ing cultural gulf between the two ethnic groups in the population and greater mutual hostility.

Belgium weathered the European financial crisis of 1931 with relatively little difficulty. The situation was considered sufficiently serious, however, for King Albert to return to Brussels from Switzerland August 7. He was reported to have temporarily assumed direction of Belgium's foreign affairs, as was his habit in times of crisis. The Chamber of Deputies on February 26, by a vote of 86 to 70, passed a law legalizing cremation, despite the opposition of the Cabinet. The cremation issue was raised by the action of Catholic officials, the Papal Nuncio, and the Catholic chaplains in refusing to attend the funeral of Lieutenant General Bernheim, one of Belgium's most distinguished military leaders in the World War, who died in Paris February 13 and was cremated. He was given a state funeral in Brussels on February 21, which was attended by the King and many high officials.

Before adjourning July 16 for the summer, Parliament ratified the Oslo agreement, a pact of economic coöperation signed by Sweden, Denmark, Norway, Belgium, and the Netherlands. The agreement was designed to carry out the tariff truce provision of the Geneva Convention. On December 10, the Chamber, by a slight majority, authorized the government to initiate immediately negotiations with France and Holland for the organization of a customs union.

To cut off the influx of foreign labor into Belgium, the regulations of the Department of Industry, Labor, and Social Welfare were drastically tightened by royal decree. Anti-Italian demonstrations by Belgian students were organized in Brussels following the arrest in Milan April 10 of Leopold Moulin, charged with complicity in anti-Fascist activities. Moulin was a Belgian secondary school teacher, who was registered as a graduate student in the University of Brussels. On July 19, the centenary of the entry into Belgium of Leopold I, first King of the Belgians, there were ceremonies at La Panne, Furnes, and Ostend.

**BELIZE.** See BRITISH HONDURAS.

**BELLINGER**, BRIG. GEN. JOHN B., U. S. A., RET. An American soldier, died in Washington, D. C., Sept. 22, 1931. He was born in Charleston, S. C., Apr. 15, 1862, and was graduated from the U. S. Military Academy in 1884. Commissioned in the Cavalry, he served in Wyoming, Kansas, and Indian Territory (later Oklahoma) until 1888, when he was appointed instructor at the U. S. Military Academy, serving also as quartermaster and disbursing officer at that institution from 1894 to 1898 and again from 1900 to 1903. During the Spanish-American War he planned and executed the movement of the 5th and 7th Corps for embarkation to Cuba and also the return of the United States troops, due to fear of yellow fever, from Cuba and Porto Rico through the quarantine stations in Florida and Georgia. He served as depot quartermaster and general superintendent of the Pacific Army Transport Service in San Francisco from 1906 to 1909, and during the next two years was in charge of preparing plans, constructing buildings, organizing and equipping shops, and so forth, at Fort Mills on Corregidor Island in Manila Bay. He also originated and executed

the supplying of food and equipment to the American Expeditionary Forces at Vladivostok, Siberia, during the World War. In 1921 he received the Distinguished Service Medal for his services as department quartermaster of the Philippines, and in 1922 was made brigadier general and assistant to the quartermaster general, retiring in 1926.

**BENGUELA RAILWAY.** See ANGOLA and CONGO, BELGIAN.

**BENNETT**, (ENOCH) ARNOLD. A British novelist, critic, and dramatist, died in London Mar. 27, 1931. He was born in Hanley, North Staffordshire (the Hanbridge of the "Five Towns" made famous by his pen), May 27, 1867, and attended the Newcastle Middle School and the University of London. After acting successively as reporter on a provincial newspaper, as a law clerk, and as editor of *Woman*, a weekly periodical, he resigned in 1900 to devote himself entirely to literature. His claim to distinction rests upon the group of novels, *Anna of the Five Towns* (1902), *The Old Wives' Tale* (1908), *Clayhanger* (1910), *Hilda Lessways* (1911), and *These Twain* (1916), and the short stories, *Tales of the Five Towns* (1905), *The Grim Smile of the Five Towns* (1907), and *The Matador of the Five Towns* (1912). These are studies of commonplace people in the commonplace setting of a string of dingy manufacturing towns, but their psychological insight, their fine workmanship, their impassive, long-drawn, and minute realism place them among the most notable English novels of their time. *The Old Wives' Tale* and *Clayhanger*, in particular, have the stamp of genius in their sympathetic understanding of human character and experience and in the contribution which they have made to England's social history.

Bennett was one of the most prolific and versatile of modern writers, occasionally publishing during a year four or more books. Outstanding among these are *The Grand Babylon Hotel* (1902); *A Great Man* (1904); *Sacred and Profane Love* (1905); *Whom God Hath Joined* (1906); *Buried Alive* (1908); *The Card* (1911); *The Regent* (1913); *The Pretty Lady* (1918); *The Roll Call* (1919); *Mr. Prohack* (1922); *Riceman Steps* (1923); and *Lord Raingo* (1926). The best of his miscellaneous writing, though of somewhat ephemeral nature, is included in *The Truth about an Author* (1903), *How to Live on Twenty-four Hours a Day* (1908), *Literary Taste and How to Form It* (1909), and *The Author's Craft* (1914). Of his 14 plays, the most successful were: *What the Public Wants* (a satire on Fleet Street, 1909); *Milestones* (with Edward Knobloch, 1912); and *The Great Adventure* (a dramatization of his novel, *Buried Alive*, 1913). His greatest contribution to English literature was a realistic imagination that imbued the most commonplace object or incident with glamour and made the lives of the most ordinary individuals seem extraordinary and even beautiful.

**BEQUESTS FOR EDUCATION.** See UNIVERSITIES AND COLLEGES.

**BEREA COLLEGE.** A nonsectarian, co-educational institution in Berea, Ky., founded in 1855 and designed to serve the educational needs of the mountain people of the Southern Appalachian region. The enrollment for the autumn of 1931 was 1775, distributed as follows: College, 585; academy, 570; foundation

junior high school, 466; nurses, 33; and training school, 121. The enrollment in the summer session of 1931 was 436, of whom 220 were in the college, 98 in the normal school, and 118 in the academy. The faculty numbered 107. The endowment amounted to \$9,515,215, and the income for the year ending June 15, 1931, was \$581,397. The library contained 60,000 volumes. Presser Hall, including the Gray Auditorium, was erected in 1931 and was to be devoted to music instruction. The secondary normal school was discontinued at the end of the 1931 summer session on account of a change in the State requirements for certificates. President, William J. Hutchins, D.D., LL.D.

**BERLIN, GREATER.** See MUNICIPAL GOVERNMENT.

**BERMUDA.** A British colony in the North Atlantic Ocean about 580 miles east of Cape Hatteras, North Carolina, consisting of a group of 300 small islands. About 20 of the islands are inhabited. Because of its picturesqueness and proximity to New York (677 miles), it is a favorite winter resort for American tourists. Area, 19.3 square miles; population, according to the census of 1921, 20,127 (7006 white); estimated in 1929, 31,500 (15,550 white). The chief town, Hamilton (population 3000) is an important naval base. Radio-telephone service between the United States and Bermuda was opened Dec. 21, 1931.

Primary schools receiving government aid numbered 32 in 1929, with 3719 pupils. Potatoes, onions, lily bulbs, and other vegetables are cultivated for the United States market. Imports in 1930 were valued at £1,954,568 and exports at £191,727. Imports from the United States in 1930 were valued at \$4,700,000 and exports to that country at \$700,000. Revenue in 1930 amounted to £429,990; expenditure, £409,572, public debt, £70,000. The tonnage of vessels entered and cleared (1930) aggregated 5,739,748 tons. The Hamilton-Somerset Division of the new Bermuda Railway was officially opened May 23, 1931; the St. George section of the line was still under construction. The first fresh water system on the island was placed in operation at Hamilton Nov. 30, 1931. The government is administered by a governor, assisted by an executive council of seven members and a legislative council of nine members, both appointed by the Crown, and an assembly of 36 members chosen by 1523 electors. Governor, Maj.-Gen. T. A. Cubitt, appointed 1931.

**BERMUDA BIOLOGICAL STATION.** See BIOLOGY.

**BERRIES.** See HORTICULTURE.

**BERTHELOT, bër'tlô', GEN. HENRI-MATHIAS.** A French soldier, died in Paris Jan. 28, 1931. He was born in Feurs, Loire, Dec. 7, 1861, and attended the École supérieure de Guerre. Commissioned in the infantry in 1883, he served in Algeria, Tongking, and Annam. He became secretary to the General Staff in 1907, and on the outbreak of the World War was appointed major general and chief aide-de-camp to General Joffre. In January, 1915, he was made general of the 53d Division and was next promoted to the command of the 32d Army Corps, which during the battle of Artois in May and June, 1915, took the famous network of trenches between Souchez and Arras known as the Labyrinth. He also took part in the second Champagne offensive in September, 1915, and the defense of Verdun, and in

September, 1916, was sent to Rumania as head of the French Military Mission. After the Rumanian defeat in August, 1917, he returned to France and was given command of the 5th Army during the second battle of the Marne in July, 1918. He then returned to the Balkans as commander-in-chief of the Serbian army, which crossed the Danube on Nov. 10, 1918, entering Sarajevo. After the War he was Governor of Metz, and later of Strassburg, commander-in-chief of the Lorraine, and a member of the Conseil supérieur de la Guerre. He retired in 1928.

**BES'SARABIA, bës'-ä-rä'bî-ä.** A former province of the Russian Empire, joined on Apr. 11, 1918, to Rumania, whose title was confirmed by the Peace Treaties of 1919, but has never been conceded by the government of the Soviet Union. Area, 17,146 square miles; population, 2,344,800. See RUMANIA.

**BEYER, bi'ër, SAMUEL WALKER.** An American geologist and mining engineer, died in Ames, Iowa, June 2, 1931. He was born in Clearfield, Pa., May 15, 1865, and was graduated from the Iowa State College in 1889 and with the Ph.D. degree from Johns Hopkins University in 1895. At Iowa State College he served as instructor in geology and mining engineering from 1891 to 1895, assistant professor from 1895 to 1898, and professor after 1898. He also was made vice-dean of the engineering division in 1908 and dean in 1917. After 1919 he was dean of the industrial science division. He became a member of the Iowa Geological Survey in 1892 and of the United States Geological Survey in 1901. He was the author of *The Sioux Quartzite and Certain Associated Rocks* (1895); *Geology of Boone, Marshall, Story, and Hardin Counties, Iowa* (1895-99); *Clay and Clay Industries of Iowa* (1903); *Iowa Quarries and Quarry Products* (1906); *Iowa Peat Deposits* (1908); and *Road and Concrete Materials in Iowa* (1914).

**BIANCHITE.** See MINERALOGY.

**BIBLE SOCIETY, AMERICAN.** Organized in 1816, this society has steadily carried forward its specific purpose of "circulating the Holy Scriptures without note or comment." This service is rendered without discrimination as to class, color, or creed. Bibles, Testaments, and Portions are sold without purpose of profit, and below cost or donated free when circumstances justify. The work in the United States is carried on through 10 home agencies and some 100 auxiliary, State and local Bible societies. Twelve additional agencies cover all Latin America and countries in the Near East and the Far East, correspondents helping the work in other countries, especially in Europe and Africa. During 1930 the society issued 12,035,133 volumes in 285 languages. Engaged in this work were 363 colporteurs, 1946 correspondents, and 2943 volunteers. The number of volumes issued in the United States by 1793 persons was 5,573,278, and in foreign lands by 3458 persons was 6,461,855. During the 115 years of its existence the society has issued 228,234,048 volumes of Scriptures and participated in the translation, publication, and distribution of the Scriptures in more than 300 languages, dialects, and versions.

During 1930 translation work was carried forward and, in some cases, books of the Bible were published in Cheyenne (North America), Mam and Cakchiquel (Central America), and Aymara (South America). In the Near East

translation and revision of the Bible in Turkish, to be printed in roman characters, was continued, and a Gospel was brought out in Arabic in decorative chirography. In the Far East the outstanding achievement of the year was the completion of the revision of the Siamese New Testament, while a pioneering effort was made for mastering the Miao tongue in northern Siam for the production of the Scriptures therein. In the Philippines revision work, in some cases approaching a new translation, was continued so as to provide Scriptures in the main languages and in some of the minor languages in use on those islands. Requests for a translation were also received from a group representing 25,000 inhabitants of the Cuyo Islands. Responses were being made to the calls for more complete translations for the Cotobato and Lanao Mohammedans in Mindanao and for the Moros (Mohammedans) in Sulu. In Africa the Bulu New Testament was reprinted during the year, and translation work was being carried out among tribes for whom nothing had yet been published.

The budget of the society for 1930 was \$1,340.090. The officers were: J. Frederick Talcott, president; E. Francis Hyde, president emeritus; the Rev. Eric M. North, Ph.D., D.D., and the Rev. George William Brown, M.A., general secretaries; the Rev. Lewis B. Chamberlain, D.D., recording secretary; Gilbert Darlington, treasurer; and Charles W. Fowle, assistant secretary.

**BIBLIOGRAPHY.** See PHILOLOGY, MODERN; LIBRARY PROGRESS.

**BICYCLING.** See CYCLING.

**BILLIARDS.** The year started with a new billiard champion when Arthur Thurnblad won the three cushion professional title at Chicago in January. Thurnblad, a competitor for several years but never considered championship timber, won over Johnny Layton and Allen Hall, who tied for second place. Hall defeated Layton in the playoff for second prize money. Ralph Greenleaf won the pocket billiards crown in Philadelphia in December, regaining honors which he had held ten times before. In the large field of 12 players, Greenleaf finished without a defeat. Erwin Rudolph, former champion, tied for second place with George Kelly, a Philadelphian playing in his first tournament. Kelly won the playoff.

Two amateurs were called national three cushion champions, the National Billiard Association considering Frank I. Fleming the high rank man, and the National Association of Amateur Billiard Players naming Edward Lee. Fleming was beaten by Robert Harper later in the year. The amateur pocket billiard title was in many different hands during the course of the year. Robert Cole won it in tournament play and lost it in less than a month to Cy Yellin in a challenge match. Yellin lost it to Ed Fagan and the latter dropped it to Howard Shoemaker, former champion, in November.

While the National Billiard Association was unable to get Jake Schaefer, national professional 18.2 balkline champion to bring his title into play, it turned its attention to the amateurs and conducted the Class A tournament. In the championship held at the New York Athletic Club in New York City, Percy N. Collins, of Chicago replaced Edgar Appleby as champion. Later in the year Appleby regained the peak by defeating Collins in a challenge match. Fred

Unger won the Class B title, but illness caused him to default a challenge to Nelson B. Mayo. Mayo successfully defended his crown against the challenge of Joseph R. Johann. Class C honors fell to Anthony La Via, the ultimate winner in a field of more than twenty players in Brooklyn.

Charles J. Steinbugler was the winner of the Poggenberg Cup, the annual handicap tournament for all three classes of amateur players. Willie Hoppe defeated Welker Cochran in a match in Pittsburgh for the 18.1 professional balkline championship, which Cochran had won from Hoppe the previous year. Hoppe set a competitive high run record of 243 in this match.

Sydney Lee won the amateur honors in England. No professional championships were held because of disputes over the conditions. Miss J. Gardner won the British women's professional championship and Miss R. Harrison won amateur laurels.

**BILLOT, bē'yō', LUDOVICO (LOUIS).** A former cardinal of the Roman Catholic Church, died near Rome Dec. 18, 1931. Born in Sierch, Moselle, France, Jan. 22, 1846, he entered the Jesuit Order, serving for 25 years as professor of dogmatic theology at the Gregorian University in Rome, where he was one of the most prominent champions of orthodoxy during the modernist controversy. In 1911, after having acted for two years as adviser to the Holy Office, he was made a cardinal deacon. He first tendered his resignation some time before the conflict between *L'Action Française* and the Holy See became acute. This conflict had developed from a change in the programme of the Royalist party, which originally had aimed only at the restoration of the throne and the reestablishment of close relations between church and state. The French clergy withdrew their support of the party, when its programme was widened to include campaigns of hatred against Socialists, Jews, Masons, Communists, and organized labor. In 1924 the French Government, supported by the episcopate, protested against any support of *L'Action Française* by the Vatican, and two years later the organ was placed on the Index. It was regarded, however, that Cardinal Billot's resignation, which was accepted in September, 1927, was in accord with this action of the Vatican. He retired to a Jesuit novitiate at Rocca di Papa, near Rome, the first cardinal to resign from the Sacred College in nearly a century.

**BIOGRAPHY.** See LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; etc.

**BIOLOGICAL CHEMISTRY.** See CHEMISTRY; ZOÖLOGY.

**BIOLOGY.** See ZOÖLOGY.

**BIRDS.** See ZOÖLOGY.

**BIRMINGHAM-SOUTHERN COLLEGE.** A coeducational institution for higher learning in Birmingham, Ala., founded in 1856. The enrollment for the autumn of 1931 was 865, and for the summer session 770. There were 59 faculty members. The endowment amounted to \$780,000, and the income for the year was \$312,500. There were 25,000 volumes in the library. During the year a new woman's building costing approximately \$100,000 was completed. President, Guy Everett Snively, Ph.D., LL.D.

**BIRTH RATES.** See FRANCE, GERMANY, GREAT BRITAIN, SPAIN, ITALY, and JAPAN and the

other principal countries under *Area and Population*; also *CHILD WELFARE*; *VITAL STATISTICS*.

**BISMARCK ARCHIPELAGO.** A group of islands in the western Pacific, formerly a German possession, assigned to Australia under mandate of the League of Nations and included in the Territory of New Guinea (see *NEW GUINEA*). The chief islands of the archipelago are New Britain (14,600 square miles), New Ireland (2800 square miles), Lavongai (460 square miles), and the Admiralty group (663 square miles). The native population of patrolled areas in 1929 was 129,074.

**BLISTER RUST.** See *FORESTRY* under *Insects and Disease*.

**BOHEMIA.** The largest and most populous Province of Czechoslovakia; formerly a crownland of Austria; situated in the northwestern part of the former Austro-Hungarian Empire, with Saxony and Silesia on the north, Moravia on the east, and Lower and Upper Austria on the south. Area, including the small Austrian and German territories which were added by the peace treaty to Czechoslovakia, 20,102 square miles; population, Feb. 15, 1921, 6,670,582; estimated population, Jan. 1, 1930, 6,995,427. Bohemia is represented in the Czechoslovak Legislature by nine Deputies and five Senators. See *CZECHOSLOVAKIA*.

**BOILERS.** The record in output of a single steam boiler, of 1,250,000 pounds of steam per hour, established with a 400-pound-pressure boiler at the East River Station of the New York Edison Company in New York City, still held; but during 1931 two boilers were placed in service at the Rouge plant of the Ford Motor Company in Detroit that were the largest high-pressure boilers built. Each of these generated 700,000 pounds of steam per hour at 1400 pounds pressure and they occupied the same space as two 250,000-pound boilers that operated at 250 pounds pressure.

Higher steam temperatures and simplification in design marked the trend during the year. The latter feature was borne out by the relatively large number of single-pass boilers installed. A notable event in boiler practice was the acceptance under stipulated safeguards of welded construction by the Boiler Code of the American Society of Mechanical Engineers. As a result of this a considerable number of welded boiler drums were turned out.

The mercury boilers designed for the Schenectady and the Kearny units (see *POWER PLANTS*) marked an advance in the application of the binary cycle for power generation. These mercury boilers also employ mercury furnace walls.

In the realm of extremely high pressures two experimental boilers were installed, one at Purdue University which operated at 3700 pounds pressure, and one at the Bayonne Works of the Babcock & Wilcox Company which had run at 5000 pounds. Neither employs a steam drum but each consists of a continuous coil of seamless steel tubing supplied with feed water at one end and delivering high-pressure steam at the other. The Purdue boiler had two parallel circuits and the Bayonne boiler seven. These boilers were to be used to investigate operation at and above the critical pressure. A third high-pressure boiler was installed at the laboratory of the Yarnall-Waring Company to operate at 2500 pounds pressure in supplying steam to test high-pressure equipment for installation in boiler rooms.

In the marine field the Hamburg-American steamship *Ackermark* went into service with a Benson boiler operating at 3200 pounds. This unit had sufficient capacity to generate all the steam required to operate the vessel although installed in the same space as formerly occupied by one of the older low-pressure boilers.

Despite these outstanding units and the fact that one 1800-pound and several 1200-1400-pound plants of large capacity went into commercial operation both in the United States and in Europe during the year, the moderate pressure boilers predominated in numbers, even in large power stations. This may be accounted for by the fact that higher steam temperatures with moderate pressures have made it possible to eliminate reheating between the high- and low-pressure elements of the turbine and still achieve an efficiency comparable with that of high steam pressures.

The completion of a number of large natural gas pipe lines throughout the country resulted in wider use of that fuel under steam boilers. Also more extensive use was made, in favorable locations, of by-product fuels such as refinery wastes and many boilers were installed with furnaces designed to use several fuels either separately or in combination. See *STREAM TURBINES*.

**BOKHARA**, bô-kü'ra. The name applied to a former central Asian state, and also to its capital city. The Bokharan People's Socialist Republic established in August, 1920, was incorporated in the newly formed Uzbek Soviet Socialist Republic, Dec. 5, 1924. See *SOVIET CENTRAL ASIA*.

**BOLIVIA.** A republic occupying the central Andean region of South America, bounded by Brazil and Paraguay on the east, by Argentina on the south, by Chile and Peru on the west, and by Brazil on the north. Sucre is the seat of the supreme court and is historically regarded as the capital, but the actual seat of the government and the largest city is La Paz.

**AREA AND POPULATION.** The area is approximately 547,000 square miles; the population was estimated in 1930 at 2,972,583, including about 1,586,650 Indians, 426,200 whites, and 898,400 of mixed race. The 1900 census population was 1,810,000. The chief cities, with their estimated populations in 1929, were: La Paz, 146,930; Oruro, 40,700; Cochabamba, 36,196; Potosí, 34,083; Sucre, 34,577; and Santa Cruz, 30,323. Spanish is the language of the educated classes, that of the natives Aymara and Quechua. Roman Catholicism was the State religion under the Constitution of 1880.

**EDUCATION.** Elementary education is free and nominally compulsory, but the percentage of illiteracy remains high. In 1928, there were 83,548 pupils in public primary schools, 22,069 in private schools, and 6537 in secondary and higher schools. There are two universities at Sucre and La Paz with more than one faculty, and eight others offering university instruction, with a total of about 800 students. The first normal school for the training of teachers for the indigenous schools was opened at La Paz, Mar. 21, 1931.

**PRODUCTION.** While agriculture is the chief support of the population, tin mining is the dominant factor in foreign trade and in the nation's financial economy. The metal normally constitutes about 90 per cent of the value of all exports. Due to the continued price declines in tin and other export products, Bolivia in 1931 faced a fifth successive year of economic and

financial depression. Total mineral exports in 1930 amounted to 87,733,944 bolivianos, as against 123,407,720 bolivianos in 1929 (1 boliviano equals \$0.365 at par). Tin, comprising 85 per cent of the total mineral exports, declined 18 per cent in volume and 27 per cent in value. Effective Mar. 1, 1931, Bolivia's production of tin was to be cut to 34,260 tons a year, under an agreement reached among world tin producers to restrict the total world output to 145,000 tons (see TIN). Quotas were not assigned, however, up to the close of 1931. Exports in 1931 were about 20 per cent less than in 1929. Bolivia's tin output in 1929 was 47,081 metric tons. Other minerals produced are copper, silver, lead, zinc, bismuth, wolfram, gold, and borate of lime. Next to China, Bolivia is the world's chief source of antimony. Petroleum has been found in the Chaco Oriental.

About 4,940,000 acres were under cultivation in 1930, the principal crops being potatoes, cacao, coffee, barley, highland rice, and rubber. Livestock in 1929 included about 1,954,915 cattle, 5,552,500 sheep, and 1,882,000 llamas and alpacas. American investments of all kinds in Bolivia, largely in mining and public utilities, increased from \$10,000,000 in 1913 to about \$133,000,000 in 1929. American direct investments (1930) were estimated at \$61,619,000.

COMMERCE. According to the President's message to Congress of Feb. 27, 1931, Bolivia's foreign trade in 1930 aggregated 164,135,145 bolivianos (about \$59,900,000 at the par value of exchange, \$0.365), which was 67,900,000 bolivianos (about \$24,780,000) less than the total for 1929. Exports amounted to 107,305,247 bolivianos (\$39,164,000) and imports to 56,829,898 bolivianos (\$20,738,763), as compared with exports of 100,617,974 bolivianos (\$36,622,000) and imports of 71,417,270 bolivianos (\$26,065,000) in 1929. The decline in the value of foreign trade in 1930 was due partly to the general slump in prices. The volume of trade was 15.4 per cent lower than in 1929, while the value decreased 23.4 per cent.

The United States in 1930 took about 13 per cent of the total exports of Bolivia and supplied over 33 per cent of all imports. As compared with 1929, Bolivian imports from the United States declined 29.5 per cent, while direct exports to the United States fell off by 59.9 per cent. However, the export figure is not an accurate index, as Bolivian exports are transhipped through adjoining countries.

FINANCE. With a budget averaging about \$16,500,000 annually from 1926 to 1929 inclusive, financial operations for the period showed a cumulative deficit of \$8,772,000. The ordinary budget for 1930 estimated both revenues and expenditures at 47,580,109 bolivianos (1 boliviano equals \$0.365 at par). Actual results were not available, but the deficit was variously estimated at from 12,237,000 to 25,000,000 bolivianos. The 1931 budget promulgated by the Provisional government at the end of January, 1931, calculated revenues and expenditures at 28,544,166 and 31,644,309 bolivianos, respectively, the anticipated deficit being 3,100,143 bolivianos. In July, 1931, however, the prospective deficit was estimated at 9,590,000 bolivianos, and drastic new economies were introduced (see under *History*). The preliminary 1932 budget calculated revenues at 26,986,158 bolivianos and expenditures at 31,502,470 bolivianos. The estimated

deficit of 4,516,312 bolivianos was to be met by increased economies and by resort to loan funds.

Bolivia defaulted on various external debt payments during 1931, although part of the May 1 interest coupon of the 8 per cent loan, due 1947, was paid. The National Economic Council on Aug. 14, 1930, announced that the public debt as of June 30, 1930, totaled 208,026,393 bolivianos (provisional figure), of which 172,067,884 represented the external debt, 11,502,300 bolivianos the internal funded debt, and 24,456,209 bolivianos the internal floating debt. Legal reserves of the Central Bank declined to 23,500,000 bolivianos on Nov. 7, 1931, from 33,587,000 bolivianos on the same date of 1930. During the same period the total cash assets declined by about 14,282,000 bolivianos to a total of 27,900,000 bolivianos.

COMMUNICATIONS. In 1931, there were 1348 miles of railway lines, of which 484 miles were government owned. Highways in the same year extended 3584 miles, of which 2762 miles were improved. There is steamer service on Lake Titicaca and about 12,000 miles of rivers are navigable for light-draught vessels.

GOVERNMENT. The Constitution of 1880 vests executive power in a President, elected for four years by direct popular vote and ineligible for re-election. Two vice presidents are similarly elected. There is a Congress of two chambers, the Senate of 16 members elected for six years, and the Chamber of Deputies of 78 members, elected for four years. One-third of the Senate and one-half of the Chamber retire every two years. The President selected a cabinet of six members. After a successful revolution in which President Hernando Siles was deposed, a military junta headed by Gen. Carlos Blanco Galindo as Provisional President, assumed control of the government on June 28, 1930. For elections in 1931, see *History*.

## HISTORY

RESTORATION OF CIVIL POWER. Due to the patriotic rectitude of the military junta under General Blanco Galindo, which assumed administrative control after the successful anti-Siles revolt of June, 1930, the transition from military to civil government took place promptly and peacefully early in 1931. True to its promise, the Provisional government held Presidential elections on January 4. Dr. Daniel Salamanca, who had been nominated by both the Liberal and Republican parties, was elected President without opposition. The contest for the Vice Presidency between José Tejada Sorzano (Liberal) and former President Juan Bautista Saavedra (Republican) went to the former by an overwhelming vote. On January 30 the Provisional government convoked Congress for February 26. Newly elected municipal officials took office throughout Bolivia on February 3, relieving the appointees of the military junta. Shortly before surrendering its power, the Provisional government (February 25) put into effect eight constitutional amendments adopted at the January election. The amendments were calculated to decentralize the government and to make the establishment of dictatorships more difficult than in the past. Congress convened as scheduled February 26 and constitutional government was restored in full with the inauguration of President Salamanca on March 5.

THE SALAMANCA RÉGIME. Dr. Salamanca's administration was faced from the start by over-

whelming financial difficulties and the revival of the party and regional strife which for generations had characterized Bolivian politics. Despite these obstacles the President enhanced his reputation for integrity and ability. Combining tact with firmness, he quickly terminated serious strikes of telegraph and postal workers and teachers in April. Food riots in La Paz and other cities, alleged to have been instigated by Communist agitators, were easily quelled. Drastic economies, including the disbandment of four army regiments and the reduction of governmental and army salaries, were effected in an effort to balance the budget (see under *Finance*).

The Bolivian Financial Commission, sent to the United States in December, 1930, to seek a modification of the terms of the 1922, 1927, and 1928 loans, reached no agreement with the bankers and interest payments due on a number of loans were defaulted. Foreign debt charges amounted to about 16,000,000 bolivianos annually and if they had been met in 1931 they would have absorbed between 65 and 75 per cent of the total revenue. The 1931 budget accordingly allotted only 4,000,000 bolivianos and the 1932 budget 5,244,000 bolivianos for service of the national debt. Congress in the first half of 1931 authorized the flotation of a new 10,000,000-boliviano loan from the Central Bank and Mercantile Bank. The President, in his address at the opening of a second session of Congress August 6, stated that 4,000,000 bolivianos out of the total had been obtained and expended. On September 23, Congress authorized the Central Bank to suspend gold payments for a period of 30 days, or longer if the government considered a longer period essential. Gold payments were suspended from October 1 to December 26. A law establishing a moratorium on commercial obligations contracted abroad in foreign money became effective October 9, but was suspended November 17. A decree of November 19 provided for the raising of a 5,000,000-boliviano loan through a 7 per cent levy on customs duties. It was announced officially in La Paz October 8 that at the suggestion of the Central Bank of Bolivia, a conference of the central banks of Bolivia, Colombia, Ecuador, Chile, and Peru would be held in Lima, Peru, to discuss an inter-American discount system. Representatives of the Federal Reserve Bank of the United States participated. See *PERU* under *History*.

Charges that Vice President Tejada Sorzano had accepted a bribe from the Standard Oil Company in 1919 in connection with its oil concession while he was Finance Minister were heard by the House of Representatives in December. Señor Tejada Sorzano was acquitted by a vote of 54 to 3. A Congressional Committee, named to investigate alleged illegal acts of the Siles régime, filed formal charges of maladministration against the former President in April. A movement for the establishment of an independent national Catholic church was reported during the year.

**CHACO DISPUTE REVIVED.** The latter half of 1931 witnessed a series of fatal clashes between Paraguayan and Bolivian military patrols along the disputed boundary of the Gran Chaco. These encounters aroused new fears of a war between the two countries into which the neighboring South American states would be drawn. Direct negotiations for a settlement of the 50-year-old boundary question had been instituted following the resumption on May 21, 1930, of diplomatic

relations severed following the previous Chaco clashes of December, 1928. Failure of the effort at a direct settlement became evident in June, 1931, when reports of Paraguayan advances beyond the *status quo* boundary of 1928 were published in La Paz newspapers almost simultaneously with Paraguayan charges of increased Bolivian military activity.

Neutral Latin-American governments, led by Uruguay, sought to adjust the controversy but matters went from bad to worse with the publication of sharply conflicting statements by the Bolivian and Paraguayan legations in Washington June 18, a subsequent exchange of notes between La Paz and Asunción, and the severance of diplomatic relations by Bolivia on July 3. Meanwhile on June 24 the governments of the United States, Cuba, Colombia, Mexico, and Uruguay sent identic notes to both Bolivia and Paraguay offering their good offices in the settlement of the controversy. Bolivia on July 27 replied with a proposal for a Bolivian-Paraguayan non-aggression pact, guaranteed by five neutrals, and neutral policing of the Chaco territory pending a final settlement of the boundary dispute. The five neutral governments, on August 6, invited both countries to send special representatives to Washington to negotiate a non-aggression pact.

The invitation was accepted and separate efforts by the Argentine government for a restoration of diplomatic relations between Bolivia and Paraguay seemed on the point of fruition when a series of clashes in the Chaco introduced serious complications. About 14 soldiers were reported killed in struggles for the control of the military outpost of Agua Rica. Concerned by the slowness of both countries in naming delegates to the Washington meeting, representatives of 19 other Pan-American states dispatched a joint note to La Paz and Asunción on October 19 urging immediate action. Both governments announced their readiness to start negotiations on November 11 and on that date conversations were formally opened in Washington in the presence of representatives of the five neutral American states. At the first meeting Bolivia was represented by Dr. Eduardo Diez de Medina and Paraguay by Dr. Juan José Soler, Paraguayan Minister to Mexico. Dr. Enrique Finot and Dr. César Vasconcellos, additional delegates of Bolivia and Paraguay, respectively, arrived in Washington later. Conversations were still proceeding at the end of the year. See *Paraguay* under *History*. Consult Ernest Galarza, "Debts, Dictatorship and Revolution in Bolivia and Peru," *Foreign Policy Reports*, May 13, 1931, vol. vii, Nov. 5.

**BONUS LEGISLATION AND PAYMENTS**. See *UNITED STATES* under *Congress*; *AMERICAN LEGION*; *PUBLIC FINANCE*.

**BOOTH**, RALPH HARMAN. An American publisher and diplomat, died in Salzburg, Austria, June 20, 1931. He was born in Toronto, Ont., Canada, Sept. 29, 1873, and after a brief banking experience began his newspaper career in 1892 as cashier of the *Detroit Tribune*. In 1895 he went to Chicago where he became secretary and manager, and a few years later editor and publisher, of the *Chicago Journal*. He returned

to Detroit in 1904 as editor and publisher of the *Detroit Tribune*, and the following year became president and publisher of the *Grand Rapids Herald*. These papers were the nuclei of the Booth Newspapers, Inc., which at the time of his death included the *Grand Rapids Press*, *Flint Daily Journal*, *Saginaw Daily News*, *Kalamazoo Gazette*, *Jackson Citizen Patriot*, *Bay City Daily Times*, *Muskegon Chronicle*, and *Ann Arbor Daily News*. During 1917-18 he was vice president of the Associated Press. He was also president of the Detroit Institute of Arts and the City Art Commission and a director of the Detroit Symphony Society. In January, 1930, he was made United States Minister to Denmark.

**BOOTLEGGING.** See PROHIBITION.

**BOOTS AND SHOES.** Unlike many industries, the boot and shoe industry in the United States in 1931 registered an increase in production, the U. S. Department of Commerce placing the output at 318,239,809 pairs as compared with 304,169,748 in 1930, and 361,402,183 in 1929. With the exception of 1930 and 1924, the 1931 production ranks the lowest in the decade. During the year there was an increase in production in the misses' and children's, boys' and youths', and miscellaneous types of footwear, while the output of men's boots and shoes amounted to 77,419,567 pairs. Along with the increased production there was a steady reduction of price throughout the year and at the end of December a reduction from 15 to 20 per cent was recorded.

New York State led in 1931 production, with 73,777,340 pairs, followed by Massachusetts with 72,793,702, Missouri 40,305,501, New Hampshire 22,420,303, Illinois 22,346,464, Maine 15,653,950, Pennsylvania 15,000,445, Wisconsin 14,408,347, Ohio 11,469,658, and all other States 28,064,039 pairs. American exports of boots and shoes declined sharply in 1931; they were distributed as follows (1930 figures in parentheses): Men's and boys', 568,465 pairs valued at \$1,493,172 (1,145,894 pairs—\$3,333,994); women's, 997,502, valued at \$2,199,034 (1,599,335—\$3,992,139); children's, 234,347, valued at \$241,801 (381,913—\$419,780); slippers, 500,574, valued at \$354,420 (528,302—\$488,884); athletic shoes, slippers, leggings, etc., 40,130 pairs, valued at \$63,399 (28,609—\$56,072).

Imports of footwear in 1931 increased to 5,925,040 pairs from 5,698,533 pairs in 1930. Imports of shoes for men and boys declined from 265,783 to 146,438 pairs; shoes for women and misses from 3,249,304 to 3,137,018; children's shoes from 157,737 to 108,286, and leather slippers from 538,856 to 299,636. Imports of footwear with fabric uppers increased from 1,486,523 to 2,233,662 pairs, valued at \$492,942; of these about 77 per cent were made in Japan. See LEATHER.

**BORNEO.** An island in the Malay Archipelago, with an area of about 290,000 square miles and a population estimated in 1927 at 3,000,000. Politically the island is divided into Dutch Borneo, British North Borneo, and the British protectorates, Sarawak and Brunei. See NETHERLAND EAST INDIES, BRITISH NORTH BORNEO, SARAWAK, and BRUNEI.

**BOSNIA AND THE HERZEGOVINA,** *her'tse-gó-vě-na*. Former Provinces in the Turkish Empire, which were incorporated in the Austro-Hungarian Empire in 1908. In 1918, after the collapse of Austria-Hungary, they became Provinces of the newly established state of Yugoslavia. They were obliterated as administrative units by the law of Oct. 3, 1929, which

redivided Yugoslavia into nine new Provinces. The area was 19,768 square miles and the population, at the census of Jan. 31, 1921, 1,889,929. See YUGOSLAVIA.

**BOSTON MUSEUM.** See ART MUSEUMS.

**BOSTON UNIVERSITY.** A nonsectarian institution of higher education in Boston, Mass., founded in 1869. The enrollment for the autumn session of 1921 was 10,416, distributed as follows: College of liberal arts, 631; college and extension courses, 367; college of business administration, 3614; college of practical arts and letters, 686; college of music, 194; school of theology, 270; school of law, 514; school of medicine, 237; school of education, 3300; school of religious education and social service, 131; graduate school, 572. The enrollment for the 1931 summer session was 1980. The faculty numbered 521. The endowment amounted to \$1,959,760. In the 10 libraries of the university there were 170,322 volumes.

During 1931 three new departments were established: Placement service which, without charge, takes care of university graduates who are seeking positions, as well as undergraduates; department of student counseling and religious activities under a director who correlates and coordinates this phase of student life in the university's ten departments; and department of student health and physical education which will coordinate all varsity and intra-mural athletics and physical education for men and women under a dean. An apartment-house dormitory, valued at \$150,000, was erected to accommodate 150 women students of the Sargent School of Physical Education, which became a part of Boston University in 1930. The date of March 13 was set aside as Founders' Day and was to be observed as such annually, honoring the memory of the three founders of the university, Isaac Rich, Lee Claflin, and Jacob Sleeper. President, Daniel L. Marsh, A.M., S.T.B., D.D., Litt.D., L.H.D., Ph.D.

**BOTANY.** The general trend of botanical study during the year was along physiological and phytopathological lines, although ecology and genetics are becoming more and more attractive subjects for investigation. Taxonomy, once the dominant branch of botanical research, now appeals to comparatively few students in this country, although it is still important at many European institutions. Studies in floral anatomy occupied the attention of some investigators, and the theory of carpel polymorphism proved a controversial point. Edith R. Saunders (*Ann. Bot.* 177: 91-110. 1931) considered that her studies in the Sterculiaceae definitely established the fact of carpel polymorphism, and therefore believes that the individual ovary in this group, which outwardly has the appearance of being monomerous, is in reality composed of five carpels. Arthur J. Eames, on the other hand, thinks that the theory was disproved by anatomical study, and that although carpel specialization, reduction and loss have freely occurred, there is no evidence of such modification (*Am. Journ. Bot.* 18: 147-188. 1931).

**PHYSIOLOGY.** Numerous studies were made of the effect of various chemicals on plant growth. A. R. C. Haas (*Bot. Gaz.* 92: 94-100. 1931) found further evidence of the necessity of boron in the healthy development of citrus fruits; while Helen S. Morris (*Bull. Torr. Bot. Club* 58: 1-30. 1931) described the toxic effect of

the same element on wheat. She found that the toxicity depends on the degree of concentration of the chemical in solution, 50 ppm causing a retardation of 40 per cent, and 100 ppm inhibiting growth almost completely. Ernest S. Reynolds (*Ann. Missouri Bot. Gard.* 18: 57-95, 1931) discussed the essential problems in the physiology of plant diseases. By cultural study two kinds of toxic substances were recognized in flax extracts, one a glucoside, linamarine, which yields hydrocyanic acid upon electrolysis, the other a new and unidentified thermostable toxic substance detected in flax extracts of higher concentration. G. W. Chapman (*New Phytologist*, 30: 119-127, 1931), investigating the cause of succulence in plants, concluded that it is probably due to a greater water-retaining power of the compounds of monovalent metals as compared with the retaining power of those of divalent metals. Edna L. Johnson (*Am. Journ. Bot.* 18: 603-614, 1931) studied the effect of light X-ray dosages which were reported to cause stimulation, using for experimentation numerous seedlings of tomato, sunberry, sunflower, and two species of vetch. She found that no appreciable increase in growth was evidenced as compared with the controls, either by measurements of height or by green and dry weight determinations. In connection with many researches on the effects of added illumination, W. W. Garner and H. A. Allard (*Journ. Agric. Research* 42: 629-651, 1931) discovered that breaking the continuity of the daily illumination period by darkening in the middle of the day, failed to affect reproductive activity nearly as much as when the light was excluded at the beginning or close of the day. In another paper Garner stated that it has been found by experiment that the beet may become an annual when subjected to a day of long illumination together with a cool temperature.

**GENETICS.** Genetic research has been extensively pursued along the lines indicated by Muller's discovery several years ago of the induction of mutations by the application of X-rays. It has apparently been demonstrated that the significance of this lies not in the direct effect of the X-rays on the genes, but in the ionization of the transmitting medium, setting free electrons which cause mutations by their direct impact upon the genes.

**Metaxenia**, or the direct action of pollen on tissues of the parent plant, known first in corn, was found to occur in the date palm, and this suggested a series of experiments on cotton, conducted at Sacaton, Arizona, by G. J. Harrison (*Journ. Agric. Research* 42: 521-544, 1931). The effects of metaxenia were clearly shown in the length of the lint hairs and the quality of fuzz. In connection with cotton, also, the color factor of the corolla was found by J. B. Hutchinson to have a considerable effect on the plant, since it modifies petal size and lint length in both New and Old World cottons. In a study of wheat and rye hybrids and back crosses, V. H. Florell (*Journ. Agric. Research* 42: 315-339, 1931) indicated the possibility of producing some constant strain that might prove of economic value. Dontecho Kostoff (*Am. Journ. Bot.* 18: 112-113, 1931) described a fertile triple hybrid tobacco, the species involved being *Nicotiana tabacum*, *N. sylvestris*, and *N. rusbyi*. He believed it to be the first case of such a hybrid truly composed

of complete contributions from each of three variable and different species of the tobacco family.

**ECOLOGY.** The experiments on seed viability initiated by the late Dr. W. J. Beal in 1879 were discussed by Darlington (*Am. Journ. Bot.* 18: 262-263, 1931). At that time a quantity of seeds of various plants were buried, and viability tests have since been conducted at intervals of five and ten years. The five species of which a certain percentage of seeds germinated after fifty years were *Rumex crispus*, *Oenothera biennis*, *Verbascum blattaria*, *Brassica nigra*, and *Polygonum hydropiper*.

Turesson (*Hereditas* 14: 99-152, 1931) conducted investigations for several years on the selective effect of climate upon plant species in a Swedish experimental garden. Northern and southern plants grown together tended to retain whatever differences in stature they might possess. Spring blooming plants of north and south behaved differently. The various tests showed also that in the case of many species, mild and severe climate forms are not mere ecological variants but biotypes of different hereditary nature. Firbas (*Jahrb. f. Wissenschaft. Bot. Bd.* 74: 459-696, 1931) made a detailed study of high moor vegetation in Europe, and concluded that except for *Drosera*, most of the species are strongly xerophytic, possessing a relatively large surface and well developed conducting system.

Experiments on trenched and untrenched plots on a pure stand of white pine (*Bull.* 30, School of Forestry, Yale Univ.) showed that diminishing root competition for moisture had the effect of increasing the number of species and individuals. Thus in the trenched plot after eight years there were 1882 individuals of 31 species, and in the untrenched plot after the same period 267 individuals of 25 species. E. Wyllie Fenton (*Journ. Ecol.* 19: 75-97, 1931), discussing the influence of sectional grazing on grassland flora, found that one result was a marked increase of perennial rye grass and white clover, which tended to form an association. F. E. Fritsch (*Journ. Ecol.* 19: 233-271, 1931), studying the ecology of freshwater algae, classified them as follows: A, attached communities (including epiphytic and silt-bottom forms); B, floating macro-communities (as distinguished from plankton); C, loose-lying communities; D, plankton. H. Heilig (*Zeit. f. Botanik B.* 25: 225-279, 1931) furnished data as to the osmotic pressure of a number of species of plants.

**PHYTOPATHOLOGY.** Herbert S. Jackson (*Mem. Torr. Bot. Club* 18: 1-108, 1931), discussing present evolutionary tendencies in the origin of life cycles in the Uredinales, concluded that the ancestral rusts were heteroecious, heterothallic. Reduction in the life cycle has in many cases been accompanied by the development of homothallism. Delia E. Johnson (*Phytopathology* 21: 843-864, 1931) described four types of bacteria antibiotic to certain smuts and other fungi, and R. H. Bamberg (*ibid.* 881-900) also found that some cultures of bacteria had a deleterious effect on the development of corn smut (*Ustilago zeæ*). In connection with the mosaic disease of tomato, Heuberger and Moyer (*Phytopathology* 21: 745-750, 1931) discovered that early infection caused the greatest amount of reduction in yield. A description of a fungus disease of date palms in California and Arizona, to which the name black scorch has been applied, was

presented at the fifteenth annual meeting of the Pacific division of the American Phytopathological Society by L. J. Klotz and H. S. Fawcett. A root disease of sugar cane seedlings proved serious in the Philippines. It was studied by Julian A. Agati (*Phil. Journ. Agric.* 2: 1-26, 1931) who concluded that soil disinfection was the only dependable measure for control in the seed bed. C. P. Sideris and G. E. Paxton (*Am. Journ. Bot.* 18: 465-468, 1931) found that the greater portion of pineapple root rot was caused by *Nematosporangium rhizophithoron* and *N. polyandron*, and a considerable amount by species of *Pythium*. It was stated that species of *Fusarium*, often suspected as causal agents of this disease, are likely to be of minor importance under field conditions. J. H. Craigie (*Phytopathology* 21: 1001-1040, 1931) made some important experimental investigations of sex in the rust fungi. Carl E. F. Guterman (*Yearbook N. Y. Hort. Soc.* 1930) presented a popular account of the diseases of lilies, summarizing all available information on the subject. At the fourth annual cotton root rot conference, held at College Station, Texas, in January, 1931, 46 papers were presented by 34 botanists, pathologists, chemists and agronomists, giving the results of experimental work on the life history, and methods of control. These papers were summarized in *Phytopathology* 21: 957-964, 1931.

**TAXONOMY.** Professor Frere Victorin continued his critical investigation of the flora of the St. Lawrence basin (*Contr. du Laboratoire de Bot. de l'Univ. de Montreal*, Nos. 16-18, 1931), of which the most interesting is a revision of the cruciferous genus *Rorippa* in the province of Quebec. He concludes that *R. palustris*, the common watercress, is a large polymorphic species, which has produced several geographic varieties and adaptive forms. J. W. Gregor (*New Phytol.* 30: 204-217, 1931) presented the results of further studies on the experimental delimitation of species in connection with timothy (*Phleum pratense*). In this species two intersterile groups were found to occur. But it was possible to cross these with *P. alpinum*, and therefore *P. pratense* and *P. alpinum* constitute, in Turesson's terminology, a cœno-species, which includes several groups, or eco-species, of less magnitude, and the latter still smaller units, or ecotypes. H. A. Gleason (*Bull. Torr. Bot. Club*, May, 1931) presented the botanical results of the Tyler-Duida expedition to Venezuela in 1928-1929, giving a list of plants collected on Mount Duida with descriptions of some new species. The mountain is at the west end of the Pacaraima range, and its botanical features have hitherto been practically unknown. The flora has proved to be fully as endemic as that of the neighboring Mount Roraima, explored much earlier.

Among the important books of the year were the following: A. M. Johnson, *Taxonomy of Flowering Plants* (New York); Honcamp, *Handbuch der Pflanzenernährung und Düngerlehre* (Berlin); Dr. H. M. Fitzpatrick, *The Lower Fungi—Phycomycetes*; Professor Percy Groom, *Technology of Woods and Fibers*. An international address book of botanists was announced as shortly to be published by the Bentham trustees with aid from the Carnegie Foundation. It will contain the names of botanists in the United States and other parts of the world.

**BOULDER CITY.** See CITY AND REGIONAL PLANNING; DAMS; NEVADA.

**BOULDER DAM.** See under DAMS.

**BOUNDARY DISPUTES.** See BOLIVIA, COLOMBIA, GUATEMALA, IRAQ, under History.

**BOWDOIN COLLEGE.** An institution of higher education for men in Brunswick, Me., founded in 1794. The enrollment of the autumn session of 1931 was 570. There were 54 faculty members. The productive funds of the college amounted to \$6,321,000, and the income for 1930-31 was \$534,000. There were more than 152,000 volumes in the library. President, Kenneth Charles Morton Sills, LL.D.

**BOWLING.** Walter Clack of Erie, Pa., was the surprise of the 1931 American Bowling Congress held at Buffalo in the spring. With a score of 712, Clack succeeded Larry Shotwell, defending champion, as singles title holder. Mike Mauser of Youngstown, Ohio, won the all-events with a score of 1966, and Charley Reilly and Eddie Rafferty of Philadelphia won the doubles. The five-man team laurels went to the S. and L. Motors of Chicago. The A. B. C. tournament was marked by the largeness of the entry, 3649 teams taking part in the competition. Joe Falcaro regained his world's singles championship by defeating Joe Scribner of Detroit 13,131 to 12,138 in sixty games. Falcaro was titleholder in 1929 but did not defend his title in 1930 and Scribner claimed the laurels.

The Boston Club won main honors in lawn bowling when it captured the national rink title in the tournament at Hartford. In the same tourney the Brooklyn Club of the Metropolitan District Association won the East-West competition. The Metropolitan District Association title was won by Van Cortlandt.

**BOXING.** The fifty-fifth heavyweight boxing champion of the world, dating from the time James Figg was the idol of all Great Britain,—Max Schmeling of Germany, who won his crown on a foul in a fight with Jack Sharkey in New York City in 1930—retained his title in the highlight of the 1931 season. In a bout in Cleveland, July 3, the German knocked out Willie Stribling, Georgia contender, and in so doing looked like a champion. Up to the fight with the Southerner, Schmeling had been disregarded when fighters were considered but his truly masterful work in disposing of the dangerous Stribling raised his reputation in the eyes of all. This bout was conducted under the auspices of the Madison Square Garden Corporation and the firm was reported to have lost money on the venture.

All in all boxing remained in the same deplorable state of affairs of the preceding two years. No dominant figure appeared—neither fighter nor promoter, and the game was in the doldrums. The sport had become riddled with graft and the public cognizant of the state of affairs was staying away from all bouts.

The heavyweight division produced several promising newcomers but they were not allowed to show against any worthy opponents. Ernie Schaaf, Boston fighter, Charley Retzlaff, a Northwest product, Steve Hamas, Brooklyn product and former Penn State College fighter boxer, and Stanley Poreda were the best of the newcomers. King Levinsky, hard hitting Chicagoan, was a surprise, giving Primo Carnera a fine battle and defeating Tommy Loughran, master boxer, in Madison Square Garden in December.

One title to change hands in 1931 was the

welterweight. Lou Brouillard, 20-year-old New England sensation, ended Jack Thompson's reign in a bout in Boston in the autumn. All this happened after the California Negro had regained his crown from Tommy Freeman earlier in the year. Tony Canzoneri, lightweight champion, defended his title three times, defeating Jackie Kid Berg twice, and beating Kid Chocolate in New York in November. The relinquishing of the middleweight crown by Mickey Walker in order to fight Jack Sharkey in Brooklyn in July left the middleweight division without a king and, as the year ended, an elimination tournament was being held in the mid-West to decide Walker's successor. Gorilla Jones and Odonne Piazza appeared the best of the lot. Maxie Rosenbloom fought frequently during the year in over-weight bouts, but defeated Jimmy Slattery in a light-heavyweight championship title bout at Ebbets Field, Brooklyn, in August.

Al Brown, bantamweight titleholder, defended his title successfully in the two bouts in which the crown was in danger. He defeated Eugene Huat and Pete Sanstol. The flyweight championship remained disputed. Midget Wolgast, recognized in New York, defended his title against Ruby Bradley at Coney Island, while Frankie Genaro, National Boxing Association champion, lost his title when he was defeated by Young Perez in Paris, in November. Christopher (Bat) Battalino, world's featherweight champion, removed all suspicion that he was not a real champion when he overcame Fidel LaBarba, Freddie Miller, and Earl Mastro, and advanced into the lightweight division to trounce Al Singer, former lightweight champion.

Jack Dempsey, former heavyweight champion, launched a "comeback" campaign in the West by touring the small towns and knocking out unknowns. He made no attempt to demonstrate that he had regained his form before a large crowd in any of the big cities.

Dick Corbett, bantamweight, and Jackie Brown, flyweight, were the most promising English fighters, while Kid Perez was the idol of France.

**BOYDEN, ROLAND WILLIAM.** An American lawyer, died Oct. 25, 1931, in Beverly, Mass., where he was born Oct. 18, 1863. On graduation from the Harvard Law School in 1888, he was admitted to the Massachusetts bar and practiced in Salem for several years, before he became established in Boston. During the World War he was with the legal staff of the U. S. Food Administration, later serving as an official of the American Relief Administration in Europe. He was with the United States mission at the Paris Peace Conference, and was an unofficial representative at the joint conference of Allied and German economic experts in Brussels in 1920. In 1921 he was appointed by President Harding unofficial representative of the United States on the Reparation Commission, resigning from this post in 1924 when he had become convinced that the reparation provisions of the Versailles Treaty were impossible of fulfillment. In 1930 he was selected by President Hoover as umpire of the Mixed Claims Commission, to effect a settlement of the reparation obligations of the German government to the United States. Later in the same year he was appointed a member of the Permanent Court of International Justice at The Hague, succeeding Charles Evans Hughes who had been made Chief Justice of the U. S. Supreme Court. In August, 1931, he was

chosen president of the arbitration tribunal established in accordance with the Young (New) Plan.

**BOY SCOUTS OF AMERICA.** An organization incorporated in 1910, and chartered by Congress in 1916, to develop the character of boys and train them for the duties of adult life by influence brought to bear in their work and play. Its national constitution declares the intention to "promote the ability of boys to do things for themselves and others, to train them in scout craft, and to teach them patriotism, courage, self-reliance, and kindred virtues." Each boy, on joining the organization, takes the scout oath, admonishing him to keep himself "physically strong, mentally awake, and morally straight." The scout law requires him to exert such qualities as trustworthiness, loyalty, helpfulness, friendliness, courtesy, kindness, obedience, cheerfulness, thrift, bravery, cleanliness, and reverence. The movement is nonsectarian and without military or political connection.

The membership in September, 1931, numbered 860,199, of whom 640,670 were boys and 219,529 scout leaders. There were 12 regional scout districts under the direct supervision of the national scout executives and subdivided into 584 local councils. There are three plans of organization; a scout troop, a farm or home patrol and a lone scout tribe. Boys who live too far away from a community to join a scout unit may become lone scouts and carry on the scout programme through correspondence. A scout troop consists normally of 32 members, each troop being made up of patrols of eight or less members under a boy leader. A scoutmaster and one or more assistant scoutmasters are provided for each troop. There is also a troop committee, consisting of three or more men who are responsible for providing the leadership of the troop, camping facilities, a meeting room and other duties. Troops are usually organized in connection with an existing institution such as a church or school. A farm or home patrol may be organized with as few as two boys. It is intended for boys in rural areas. There is a scoutmaster who is sponsored by the fathers of the members of the patrol, and the meeting place may be the homes of the scouts or any other convenient place.

A lone scout tribe has a tribe committee, scoutmaster and assistant scoutmasters. It is composed of boys living sufficiently close together, who are carrying on the scout programme in patrols or as lone scouts and who can get together perhaps once a month or less often for a tribe meeting. The lone scout carries on the programme under the leadership of an adult friend and counselor.

Among the foremost scout activities are camping and hiking, nature study, sea scouting, and many kinds of athletics, and crafts, such as swimming, first aid, signaling, knot-tying, and bridge making. Successive ranks in membership—tenderfoot, second, and first class—are achieved by passing tests, graded in difficulty. Merit badges, 96 in number, may be attained by the scout of first class rank by meeting requirements for each; they cover proficiency in pursuits both of the useful and the hobby type. In order to attain higher ranks in scouting the boy must meet requirements for length of service, develop his leadership ability, and maintain his scout obligations. These and his earning a certain number of merit badges entitle him to promotion to the three ranks of star, life, and eagle scout.

In 1930 the organization provided opportunity for 300,000 boys to spend a week or more in boy scout camps. There were 652 camps conducted by local councils and more than 2400 troop camps. In its community service the boy scout movement coöperates with the U. S. Forestry Department in fighting and preventing forest fires and in conserving wild life, and planting trees. It also renders services in local campaigns of various sorts, such as clean-up and safety-first campaigns, and coöperates with many national societies and movements.

The official magazine for boys is *Boys' Life*, and for scout leaders, *Scouting*. The organization also publishes merit badge pamphlets, handbooks, and other material pertaining to the movement. The national officers in 1931 were: President, Walter W. Head; treasurer, George D. Pratt; national scout commissioner, Daniel Carter Beard; chief scout executive, James E. West; deputy chief scout executive, George J. Fisher. Headquarters of the national council, the governing body, are at 2 Park Avenue, New York City.

**BRANDES**, brän'dēs, CARL EDVARD COHEN. A Danish playwright, novelist, and statesman, died Dec. 20, 1931, in Copenhagen where he was born in 1847. A younger brother of Georg Brandes, the literary critic, he was well known as a writer on dramatic and philosophic topics. He was one of the founders in 1884 of the radical newspaper, *Politiken*, of which he was managing director for many years and one of its most important contributors. From 1913 to 1920 he held the portfolio of finance in the cabinet of which Carl Theodor Zahle was premier and minister of justice. His plays include: *Heilmittel* (1880); *Lagedidler* (1881); *Ein Besuch* (1882); *Ein Bruch* (1885); *Liebe* (1887); *Unter dem Gesetz* (1890); *Unter Loven* (1890); *Hos Sighrit* (1902); and his novels: *Ein Politiker* (1889) and *Das junge Blut* (1889).

**BRAZIL**. A federal republic, the largest of the South American states, comprising roughly the east central third of the continent. Capital and largest city, Rio de Janeiro. A site for a new federal capital has been selected in the state of Goyaz.

**AREA AND POPULATION.** The area is approximately 3,275,510 square miles, or more than 250,000 square miles greater than that of continental United States, and the total estimated population on Jan. 1, 1930, was 40,272,650, as compared with 30,635,605 at the census of 1920. The population in 1930 was divided among 20 States, one Federal District, and one Territory as follows: Alagoas, 1,189,214; Amazonas, 433,777; Bahia, 4,135,894; Ceará, 1,626,025; Espirito Santo, 661,416; Federal District, 1,468,621; Goyaz, 712,210; Maranhão, 1,140,635; Matto Grosso, 349,857; Minas Geraes, 7,432,243; Pará, 1,432,401; Parahyba, 1,322,069; Paraná, 974,273; Pernambuco, 2,869,814; Piahy, 809,508; Rio de Janeiro, 1,996,899; Rio Grande do Norte, 738,889; Rio Grande do Sul, 2,959,627; Santa Catharina, 948,398; São Paulo, 6,399,190; Sergipe, 547,965; Acre Territory, 113,725.

The chief cities, with the estimated populations in 1929, are: Rio de Janeiro, 1,468,621; São Paulo, 879,788; São Salvador, 328,898; Recife, 340,543; Belém, 279,491; Porto Alegre, 273,876; Fortaleza, 123,706; Bello Horizonte, 108,849; Nitheroy, 108,233; Maceló, 103,930;

Curitybe, 100,135. Parahyba (74,104 in 1929), capital city of the state of Parahyba, was renamed Joao Pessoa in honor of the President of the state assassinated in 1930. Between 1820 and 1930, 4,518,558 immigrants entered Brazil. Of these, 78 per cent were of Latin origin and 2,561,981 settled in the state of São Paulo. Immigrants in 1930 numbered 67,066, of whom 18,719 were Portuguese, 14,076 Japanese, 4719 Poles, 4253 Italians, 4180 Germans, and 3218 Spaniards. The 1929 influx totaled 100,424; in 1931 immigration was restricted as a result of unemployment. In July, 1931, the Japanese Consul at São Paulo estimated the number of Japanese in the city and its environs at 110,000.

**EDUCATION.** According to the census of 1920, 75.5 per cent of the total population were unable to read or write. Education is free but not compulsory, except in seven states. At the beginning of 1929 there were in all Brazil 29,430 primary schools, with 2,052,181 pupils and 47,392 teachers; 212 certified secondary schools, and 367 professional schools, with a combined total of over 37,000 pupils; and 76 teachers' training institutions. The University of Rio de Janeiro is an official university; there are two private universities, at Bello Horizonte and Curityba. A School of Economic and Social Sciences was established at São Paulo under a decree issued April 15, 1931. Other decrees issued during the year completely reorganized the educational system.

**PRODUCTION.** Though potentially one of the greatest agricultural countries of the world, Brazil has only a small fraction of available farm land under cultivation. Wheat and flour are imported in large quantities. Of the cultivated area of 17,387,000 acres in 1928, 4,133,000 acres were devoted to coffee, 6,919,000 acres to maize or corn, and 1,315,000 acres to rice. The coffee crop normally constitutes about 78 per cent of the world supply; in 1930, 15,288,000 bags, valued at \$197,426,388, were exported (14,381,000 bags valued at \$323,198,079 in 1929). The annual corn crop was officially estimated at from 5,000,000 to 5,500,000 short tons. Official figures for the 1931 rice crop showed 845,900 short tons of unhulled rice, or about 423,000 tons hulled, of which two-thirds was consumed in Brazil. The cotton crop for 1930 totaled 472,326 bales (of 500 lbs. each), produced on 1,434,800 acres. Other leading crops are cacao, tobacco, rubber, balatá (gum), sugar, yerba maté (tea), rubber, potatoes, cereals, silk cocoons, fruits and nuts, mandioca (cassava). The acute depression of agriculture during 1930 and 1931 was illustrated by the 40 per cent decrease in the value of coffee exports in 1930, as compared with 1929. Livestock estimates for 1931 were: Cattle, 38,670,000; horses, 5,750,000; asses and mules, 2,040,000; swine, 18,220,000. About 1,000,000 head of cattle are slaughtered annually for the production of jerked beef. Coffee production in 1931 was in excess of 24,000,000 bags; prices averaged \$7 to \$7.50 a bag, as against \$9 to \$10 a bag in the preceding year.

Forests cover about 1,236,000,000 acres and yield pine, eucalyptus, rosewood, and other valuable woods. The iron-ore resources compare with those of the United States, constituting about one-fourth of the world supply. Low-grade coal deposits were estimated at 5,000,000,000 tons. Manganese is the chief mineral export, going

principally to the United States. In 1930, shipments to the United States were 79,849 tons, valued at \$1,484,039. Gold, diamonds, emeralds, and other precious stones are found.

Cotton weaving is the principal manufacturing industry. There has been fairly rapid industrial development of recent years due to tariff protection, but in 1930 and 1931 industry was badly depressed. In 1929, there were about 347 cotton mills, with 123,521 employees; 216 sugar mills, 15 packing plants, 35 woolen mills, and 16 jute mills. Cement, paper, tobacco, and silk products are other leading manufactured articles. Power was furnished chiefly from imported coal, local deposits being of inferior quality and far from industrial centres. In 1931, there were about 500 hydro-electric power plants, with a combined capacity of over 700,000 horse power. The Chamine hydro-electric project, near Curitiba, and the Jerry O'Connell project at Bananeiras (State of Bahia) were completed during 1931. See *History* for the economic situation in 1931.

COMMERCE. Brazil's foreign trade declined 34 per cent in value in 1930 as compared with 1929, the respective totals being 5,251,059,000 milreis paper (\$562,388,400, computed at the average exchange rate for 1930 of \$0.1071) and 7,388,220,000 milreis paper (\$872,549,000, computed at \$0.1181 for 1929). Exports amounted to 2,907,354,000 milreis (\$311,377,000), as against 3,800,482,000 milreis (\$455,923,000) in 1929, while imports totaled 2,343,705,000 milreis (\$251,010,800), as against 3,527,738,000 milreis (\$416,620,000) in the previous year. The favorable visible trade balance was 563,649,000 milreis (\$60,366,800) in 1930 and 332,744,000 milreis (\$39,297,000) in 1929. Since Brazil's annual foreign obligations total over \$170,000,000, outpayments during 1930 exceeded receipts from abroad by some \$110,000,000.

While imports decreased in both volume and value in 1930, exports were greater in volume than for any of the previous five years, due to the largest coffee shipments since 1915. The drastic fall of prices accounted for the decline in the value of exports. The United States retained its leading position in Brazil's trade, although imports from the United States fell off nearly 50 per cent in value. The value of trade with Brazil's other leading customers declined also, but to a lesser degree. Brazilian imports, in milreis, from the chief sources of supply in 1930, with comparative figures for 1929 in parentheses, were: United States, 568,184,000 milreis or \$53,727,817 (1,063,100,000 or \$108,503,322); United Kingdom, 452,841,000 (667,757,000); Argentina, 312,059,000 (385,675,000); Germany, 267,120,000 (447,534,000); France, 118,293,000 (187,363,000). Exports were distributed chiefly as follows: To the United States, 1,179,421,000 milreis or \$130,853,892 (1,629,807,000 milreis or \$207,686,130 in 1929); France, 266,808,000 (429,440,000); Germany 265,046,000 (338,122,000); United Kingdom, 237,126,000 (251,377,000); Argentina, 199,109,000 (245,179,000). The United States furnished 24 per cent of the total imports in 1930, compared with 30 per cent in 1929, while Great Britain increased its percentage to 19.4 from 19.2 in 1929. There was a favorable trade balance of nearly \$100,000,000 in 1931. Imports totaled about \$139,000,000; exports, \$231,000,000.

FINANCE. The Federal budget for 1930 calculated revenues at 199,271,700 gold milreis and

1,371,431,300 paper milreis and expenditures at 135,113,000 gold milreis and 1,639,114,000 paper milreis (the par value of the gold milreis was \$0.5463 U. S. currency; the par value of the paper milreis was \$0.1196 and the average exchange rate in 1930 was \$0.1071). According to the Niemeyer report (see under *History*), actual revenues for 1930 totaled 118,751,000 gold milreis and 966,696,000 paper milreis. Adding extraordinary receipts and assigned revenues, total receipts for the year amounted to 120,933,000 gold milreis and 1,074,746,000 paper milreis. Actual expenditures totaled 127,055,000 gold and 1,733,158,000 paper milreis; adding expenditures from assigned revenues, the aggregated disbursements were 127,123,000 gold and 1,820,635,000 paper milreis. The deficit of 6,190,000 gold and 745,889,000 paper milreis was converted in the Niemeyer report into 783,029,000 paper milreis, or about \$83,862,000 at the average exchange rate for the year.

The budget for 1931 calculated revenues at 137,305,000 gold and 1,480,379,000 paper milreis and expenditures at 115,437,000 gold and 1,486,898,000 paper milreis. In May, 1931, the budget was drastically revised to meet a decline in customs revenues. Expenditures were reduced to an annual level estimated at 114,222,000 milreis gold and 1,357,016,000 milreis paper (a total of about \$171,383,380 at the current exchange rate). This represented an estimated expenditure reduction of about \$34,057,000 from the 1930 budget appropriations. At the same time increased taxation, estimated to bring in an additional 376,570,000 paper milreis (about \$30,125,600), was imposed. Including extraordinary revenue of 28,127,000 milreis gold due from the *Caixa de Estabilização* (Stabilization Bureau), the Finance Minister estimated that 1931 would show a surplus of 113,205,000 paper milreis (about \$9,056,400), with total expenditures of 2,175,392,000 milreis paper (about \$174,031,000) and total receipts of 2,288,597,000 milreis paper (about \$183,087,760). At the end of the first nine months of 1931, the Treasury reported a surplus of \$6,824,000 gold.

The total Federal debt on Jan. 1, 1931, according to the Niemeyer report, consisted of 2,533,916,000 paper milreis of internal funded debt and the external debt divided as follows: Pounds sterling, 100,569,751; gold francs, 193,556,110; paper francs, 135,778,500; United States dollars, 143,336,998; total, about \$671,030,000. In addition the Federal Government had guaranteed various railway and public works loans. The financial position of the Brazilian states and municipalities was in general difficult during 1930 and 1931. The Federal Minister of Justice estimated in December, 1931, that interest, amortization, and commissions on the foreign Federal, state, and municipal debts during 1931 would total about \$131,566,600. On Oct. 17, 1931, the Federal Government announced the suspension for three years of gold payments on the bulk of the foreign debt (see under *History*). The gold milreis is a unit of account employed only in certain official transactions, revenues nominally collectible in gold milreis being actually paid in paper milreis at a rate varying daily with the rate of exchange.

COMMUNICATIONS. At the beginning of 1930, there were 19,840 miles of railway lines, of which 11,829 were owned by the Federal Gov-

ernment, 5024 miles by state governments, and 2982 miles were operated under Federal concessions. The total mileage was divided into 58 different systems. The Central Railway of Brazil (1804 miles of line), the principal railway system, is owned by the Federal Government. Highways in 1930 extended a total of 75,497 miles, of which 963 miles were macadam, 2222 miles were improved but not hard-surfaced, and 73,312 miles were unimproved. Air lines link Rio de Janeiro with the chief cities of South America and the United States. During 1931, air services were inaugurated from Rio de Janeiro to São Paulo, Curitiba, and Belo Horizonte as the first step in a plan to link the capital with the principal interior cities of Brazil.

GOVERNMENT. The Constitution of 1891, modified in 1926, was suspended following the successful revolution of October, 1930. The Provisional Government of Dr. Getúlio Vargas ruled by decree throughout 1931; administration of the Government was divided among nine departments. The national and state legislatures were dissolved, pending the revision of the framing of a new constitution and electoral law. For other developments in 1931, see under *History*.

### HISTORY

GROWTH OF POLITICAL UNREST. The inauguration of Dr. Getúlio Vargas as Provisional President of Brazil on Nov. 3, 1930, marked the successful conclusion of a revolt produced partly by nation-wide discontent with political and economic conditions and partly by rivalries among the political leaders of the various states. Before a year had elapsed these same forces were threatening to overwhelm the Provisional Government. The opposition to the Vargas Government centred in its failure to ameliorate the economic depression, the delay in establishment of the promised constitutional régime, and the alleged favoritism shown by President Vargas in the appointment of political followers from his own state of Rio Grande do Sul to important posts in the Federal Government.

Dissatisfaction first came to a head in the city and state of São Paulo. A revolt among the São Paulo police was repressed without difficulty on April 28. On May 20, troops of the Federal Government suppressed a military and civilian outbreak at Pernambuco (Recife) in Northern Brazil. An agitation in São Paulo for the appointment of a local citizen in place of the Provisional Governor named by the Central Government finally caused Dr. Vargas to yield. In the third week of July rioting broke out between students and the upper classes supporting the new Provisional Governor and laborers and other adherents of Miguel Costa, chief of the state militia. Dispatches filed from Buenos Aires to escape the censorship of the Brazilian Government reported that four were killed and many injured in the São Paulo rioting. Federal troops from Rio de Janeiro were called in to restore order. In August, the Federal Government was forced to give military support to State President Olegário Maciel of Minas Geraes as against the followers of former President Artur Bernardes of Brazil, who had emerged as the leader of the anti-Vargas forces.

A more serious revolt against the Vargas régime broke out in Pernambuco toward the end of October, the trouble originating among the troops of the garrison. The outbreak was put

down after two days of fighting, with the death of two officers; subsequently some 300 participants in the rising were exiled by the state Government of Pernambuco to the island of Fernando do Noronha. On November 20, President Vargas signed a decree providing for the trial before military courts of all persons accused of subversive activities against either the Federal or state Governments.

These military movements were accompanied by a growing demand, particularly from the southern states, for the early holding of elections and the calling of a constitutional convention. In May, Provisional President Vargas announced the appointment of "technical legislative committees" to study legislative and constitutional problems in preparation for a return to constitutional government. An electoral code drawn up by these committees was promulgated in two sections in September and November. It provided a new political organization for all states and municipalities and proposed to introduce far-reaching administrative changes. The opposition aroused by some sections of the code dimmed hopes for an early return to constitutional procedure.

Dissensions within the Provisional Government were reported responsible for the resignation on November 13 of José Maria Whitaker, Secretary of the Treasury. His post was filled by the Minister of Justice, Oswaldo Aranha. Other resignations occurred at the same time.

EXECUTIVE LEGISLATION. The electoral code was but one of a series of important decrees issued by the Provisional Government during the year. These decrees abolished the inter-state and inter-municipal tariffs long customary in Brazil, effective Jan. 1, 1932, removed many of the restrictions upon the press, established a minimum wage and other advanced labor legislation, and restricted immigration as a means of relieving unemployment. Other decrees imposed emergency income taxes upon the salaries of all Government employees, provided that at least two-thirds of the employees of all business concerns must be native-born Brazilians, modified the naturalization law, and reduced the number of legal annual holidays from 12 to 6. A federal purchasing board was established, and the Government was authorized to raise import duties up to a limit of 20 per cent whenever necessary to protect the commerce and agriculture of the nation. Plans were also made to safeguard the nation's water-power and other natural resources and to increase its control of communications.

The Government also took steps calculated to improve prices of Brazil's primary agricultural products. Toward the end of December, 1931, it agreed to buy the coffee surplus of some 24,000,000 bags and to hold it for sale over a period of 10 years. Later it called an international coffee conference, which convened at São Paulo May 17, 1931. With the coöperation of the Government, the National Coffee Defense Council purchased large quantities of coffee for destruction during 1931. Despite these moves, coffee futures quotations in Rio de Janeiro at the end of July, 1931, were the lowest since 1903, and those at Santos were the lowest ever listed. With the December announcement of further plans for the stabilization of prices, including the destruction of 12,000,000 bags in the succeeding 12 months, prices improved somewhat. On Aug. 21, 1931, the Federal Farm Board of the United

States agreed to exchange 25,000,000 bushels of wheat for 1,050,000 bags of coffee held by the Brazilian Government. By a Sugar Defense Act, promulgated Sept. 15, 1931, the Government required producers to deposit in specific warehouses 10 per cent of the sugar leaving their mills for the consuming market.

**FINANCIAL MEASURES.** In January, 1931, the Provisional Government invited Sir Otto Niemeyer, British banker and economist, to study the situation in Brazil and advise the Government on necessary financial reforms. Sir Otto's report, submitted late in July, made ten major recommendations, the chief of which were the establishment of a Central Reserve Bank, along the lines of the U. S. Federal Reserve Bank, and the balancing of the Federal and state budgets. He urged that the state-owned postal and telegraph services be made self-supporting (their estimated deficits for 1931 were 20,281,000 milreis and 24,059,000 milreis, respectively), and that the Federal Railways be administered by an autonomous body free from political control in order to eliminate a chronic deficit, estimated at 21,000,000 milreis for 1931. To establish the Central Reserve Bank, an external loan of about \$80,000,000 was considered necessary. After the Niemeyer report had been carefully studied by a Government commission, provision for putting the bulk of its recommendations into effect was made by a decree issued Sept. 10, 1931. For steps taken to balance the budget, see under *Finance*.

Meanwhile a steady decline in the exchange value of the paper milreis was under way, making it increasingly difficult for governmental agencies and private debtors to meet payments on their foreign obligations. In terms of U. S. currency, the exchange value of the milreis declined from an average of \$0.1071 for 1930 to \$0.0562 for October, 1931. Accordingly, the Government on August 31 announced the suspension of sinking fund payments abroad on all except the two funding loans of 1898 and 1918 and the coffee loan of 1922. Milreis were to be deposited locally for amortization and were to be transferred abroad when the exchange strengthened. On October 8, the Government followed this with a decree declaring a 60-day moratorium on all foreign commercial and private payments; funds to cover these payments were to be deposited in national currency in Brazilian banks, however. A third decree of October 17 canceled cash interest payments for three years on all of Brazil's foreign debts except the 1898 and 1918 funding loans and the coffee loan of 1922. Payments on all other loans were to be met with scrip bearing 5 per cent interest. At the end of three years the scrip was to be converted into two bond issues at 5 per cent, one to mature in 20 and the other in 40 years. The Government sought to avert these steps by the limitation of foreign exchange transactions but failed. With the declaration of the moratorium on foreign interest payments, the restrictions on exchange dealings were lifted.

The commission appointed to examine the accounts of the Federal Government for the last three years of the Washington Luis régime submitted a report early in 1931. It reported that instead of the aggregate surplus of 404,189,000 paper milreis announced in the annual Presidential messages from 1927 through 1929, there was an actual deficit of 491,169,000 paper mil-

reis. The commission charged that 610,783,000 paper milreis had been spent irregularly and without legal sanction. The deposed President, Washington Luis, and three of his colleagues, most of whom were in exile in Europe, were found guilty of malfeasance and confiscation of their properties was threatened.

**OTHER EVENTS.** In the reorganization of the affairs of the interior states of Para and Amazonas, Federal Governors canceled almost all of the land concessions granted by previous administrations. Two concessions in Para held by Henry Ford and a Japanese subject, each for 2,700,000 acres, were not interfered with. It was reported that Ford had invested \$8,000,000 in the development of his rubber plantations and that 1500 men were employed. In October, 1931, two mixed commissions resumed the marking of the Brazil-Uruguay frontier, interrupted for four years. Preparations for taking an industrial census of Brazil were made during 1931. The American Naval Mission to Brazil, comprising 35 men, was released on Jan. 31, 1931, as an economy measure.

Consult Agnes S. Waddell, "The Revolution in Brazil," *Foreign Policy Association Information Service*, Mar. 4, 1931, vol. VI, No. 26.

**BREED, DAVID BIDDLE.** An American clergyman and educator, died in Albuquerque, N. M., Dec. 10, 1931. He was born in Pittsburgh, Pa., June 10, 1848, and was graduated from Hamilton College in 1867 and from the Auburn Theological Seminary in 1870. Ordained to the Presbyterian ministry, he held pastorates in St. Paul and Chicago until 1894, when he was called to the First Presbyterian Church in Pittsburgh. In 1898 he became professor of practical theology at the Western Theological Seminary in Pittsburgh. He also identified himself prominently with the Presbyterian Board of Missions for Freedmen. Among his publications are many tracts, notably *More Light*, which had a wide circulation; works on hymnody, especially a frequently reprinted *History and Use of Hymns and Hymn Tunes*; *Abraham, the Typical Life of Faith* (1886); *Heresy and Heresy* (1891); *History of the Preparation of the World for Christ* (1891); and *Preparing to Preach* (1911).

**BREMEN, brä'mën.** A state of the German Republic. See GERMANY under *Area and Population*.

**BRENTANO, LUJO.** A German political economist, died in Munich, Sept. 9, 1931. He was born in Aschaffenburg Dec. 18, 1844, and attended the universities of Heidelberg, Munich, Würzburg, Göttingen, and Dublin. With Ernst Engel, the statistician, he made an investigation in 1868 of English trade unionism, which resulted in his principal work: *Die Arbeitergilden der Gegenwart* (2 vols., 1871). In 1872 he was appointed professor of political economy at the University of Breslau and later held the same chair at the universities of Strassburg (1882-88), Vienna (1888-89), Leipzig (1889-91), and Munich, (1891-1914). During his early career he combated the wages-fund theory which was generally accepted by British economists, and advocated free trade in an age when a protective tariff was popular. The Eagle shield of the President of the Reich was conferred on him in 1930. Among his works are: *Das Arbeitsverhältnis gemäss dem heutigen Recht* (1877); *Über das Verhältnis von Arbeitslohn und Arbeitszeit zur Arbeitsleistung* (1893); *Agrarpolitik* (1897);

*Die Schrecken der überwiegende Industriestaat* (1901); *Die Wirtschaftliche Lehren des Christlichen Altertums* (1902); *Die Entwicklung des Wertlehre* (1908); *Die deutsche Getreidesölle* (1911); *Die Anfänge des Modernen Kapitalismus* (1916); *Arbeitslohn und Arbeitszeit nach dem Kriege* (1918); *Der wirtschaftliche Mensch in der Geschichte* (1923); and *Konkrete Grundbedingungen der Volkswirtschaft* (1924).

**BREST-LITOVSK AFFAIR.** See POLAND under *History*.

**BRETHREN, CHURCH OF THE.** A church established in the United States in 1719 in Germantown, Pa. It originated in Schwarzenau, Germany, in 1708 and is the largest of the five branches of the denomination formerly known as the German Baptist Brethren or Dunkers. Other churches of this group are: The Church of God (New Dunkards); Brethren Church (Progressive Dunkers); German Seventh-day Baptists; and Old Order German Baptists Brethren. The policy of the Church of the Brethren corresponds more nearly to the Presbyterian than to any other specific ecclesiastical form. It comprises 49 district conferences and holds a general conference annually. In 1931 there were 1029 churches, with a membership of 138,173, and 1160 Sunday schools, with an enrollment of 125,831 pupils. Foreign missionary work was carried on in India, China, and Africa, the total membership in the mission field being 5469. Expenditures for the year ending Feb. 28, 1931, totaled \$274,659. The denomination maintained eight colleges, one academy, and one theological seminary and training school, with an enrollment of 4174 students. The *Gospel Messenger* is the official organ.

Officers of the general conference in 1931 were: Moderator, Dr. D. W. Kurtz, Long Beach, Calif.; reading clerk, the Rev. C. Ernest Davis, Mt. Morris, Ill.; and secretary, the Rev. J. E. Miller, Elgin, Ill. The Rev. J. W. Lear of Elgin, Ill., was executive secretary of the council of boards; the Rev. Otho Winger of North Manchester, Ind., president of the general mission board; the Rev. C. Ernest Davis of Mt. Morris, Ill., president of the board of religious education; the Rev. S. J. Miller of La Verne, Calif., president of the general ministerial board; and Dr. C. C. Ellis of Huntingdon, Pa., president of the general education board. With the exception of the general education board, which is located at 3635 Ordway Street, N. W., Washington, D. C., the headquarters of all the boards are in Elgin, Ill.

**BRIDGE.** A game of cards. See **CONTRACT BRIDGE**.

**BRIDGES.** Although the world wide depression undoubtedly resulted in a curtailed building programme for new bridges, the year 1931 will be long remembered as notable in the number of important bridges completed within its 12 months. It was a most notable year in highway construction, and, as most contemporary bridge works are highway structures, bridge building went forward with the road building programme.

Unquestionably, the outstanding bridge event of the year was the opening on October 24 of the greatest of all bridges, that over the Hudson at New York, now officially named the George Washington Bridge. This was followed by the opening ceremonies for the Bayonne Bridge, N. Y., referred to in the past as the Kill von Kull Arch, the longest arch span in the world, on November 14. The great arch at Sydney, Aus-

tralia, illustrated in the 1930 YEAR BOOK, was also practically completed as the year came to a close.

These are to be numbered as the greatest bridges of the ages, but a host of smaller bridges, works which would have been most notable in any normal year, were also opened. Among these should be noted:

The St. John's Suspension Bridge of 1207 ft. span, over the Willamette River at Portland, Ore. on June 18. The Maysville (Ky.)—Aberdeen (Ohio) Suspension, with a 1060 ft. main span, opened November 25.

The high-level Waldo-Hancock Suspension of 900 ft. span, over the Penobscot River, Me., opened September 1.

The longest span yet built by the government of British Columbia, the Hagwilget Suspension over the Bulkley River near Hazelton, B. C., with a main span of 460 feet was completed in July.

Among cantilever structures are noted the deck-type Lake Union bridge of 800 feet main span at Seattle, Wash., dedicated in September. An unusual cantilever type bridge at Montrose, Scotland, was also opened during the year. The bridge was of reinforced concrete with a centre span of 216 feet and replaces the older suspension bridge over the South Esk at this site.

The new steel arch bridge which carries the Westchester Parkway over Croton Lake, was a notable work of the arch type, indeed it is believed to be the longest three-hinged arch yet built—750 feet centre to centre of end pins. It possessed special features of architectural, engineering, and constructional interest. An interesting and monumental steel arch bridge with concrete approaches was also recently completed at Kateweer, Holland. It has a main span of 448 feet.

The opening on July 23 of the new multiple arch concrete bridge over the Salt River at Tempe, Ariz., is also of interest. Its 10 spans of 140 feet each will carry the traffic of four main highways which converge at Phoenix, Ariz. The Arlington Memorial Arch Bridge at Washington, D. C., a combination of concrete, steel, and masonry which should perhaps be classed as a monument rather than a bridge, was also completed during the year.

A notable lift bridge completed is the Joe Page bridge at Hardin, Ill., across the main channel of the Illinois River. This now supplies, by means of a 309-foot lift span, a bridge crossing which replaces the older ferry.

A plate girder span of extraordinary size also was completed, in the approach to the highway suspension bridge over the Maumee River at Toledo, Ohio. The girder is 154 feet long and 12 feet deep. The transportation of this huge structural unit was made possible by using two 36-foot flat cars, on which bearings were provided 117 feet apart and by introducing in between two 50-foot "spacer" cars.

The movement toward public ownership in highway toll bridge construction, noted in the 1929 and 1930 YEAR BOOKS, went forward during the year. Two States were added to the list of States now financing such construction through the medium of toll-revenue bonds. The new Ohio River toll bridge at Ashland, Ky., a cantilever structure, was the first structure to be completed in the \$10,000,000 bridge programme sponsored by Kentucky. The Maysville suspension bridge, noted above, is another bridge of this group. Others were opened in November and December and it is expected that the programme will be

Across the Hudson River at New York City  
View from the New Jersey Shore

THE BAYONNE BRIDGE ACROSS KILL VAN KULL  
Erected by The Port of New York Authority

completed early in 1932. The West Virginia Bridge Commission also opened a new cantilever bridge over the Great Kanawah River which marks the initial step in their programme of State toll bridge building. The main span was 600 feet.

**GEORGE WASHINGTON BRIDGE.** Although this bridge with its stupendous 3500-foot span, was officially opened, the final cut-stone masonry covering of the approaches and east anchorage has not yet been completed. The 1930 YEAR BOOK described the spinning of the cables for this work. Upon their completion the hangers and floor system were rapidly placed and work began on the concrete roadways and sidewalks. The early opening, ahead of schedule, was in large measure made possible by the extraordinary plant developed for this concrete work. By taking advantage of the steel floor system construction, the contractor developed an unusual form system consisting of sheet-metal pans placed between the bulb beams. Concrete was handled by an industrial railway using the bulb beams as track. A giant mechanical screed was designed to smooth out the stiff concrete over the full roadway width of 29 feet in one operation. In this way a pouring schedule of 2440 linear feet of 29-foot roadway and 13-foot sidewalk per day was maintained.

In connection with the floor system the stiffening trusses of this work are particularly notable. They are of silicon steel and only 29 feet deep or  $\frac{1}{20}$ th of the main span. This is about  $\frac{1}{2}$  to  $\frac{3}{4}$  the depth used in other recent suspension constructions. The stiffening truss in this bridge is thus a more or less flexible element. This is a new departure for such loads as the rapid transit cars which it is later proposed to place on this bridge, but it was justified, in the opinion of the engineers, due to the great weight of the main span and the short side spans. A saving of some \$10,000,000 was thus effected.

The complex scheme of approaches, designed to bring traffic to and from the bridge without any grade crossings, includes two ventilated tunnels several blocks long, and in themselves constitute major engineering and construction projects. Consult *Engineering News-Record*, Oct. 22, 1931, p. 657, for full description.

**GOLDEN GATE BRIDGE.** With the Washington Bridge officially opened, attention was turned to the even greater span (4200 ft.) planned to cross the Golden Gate at the entrance to San Francisco Bay. A bond issue of \$35,000,000 was voted in November, 1930, to cover the cost of this project and bids for construction under ten separate contracts were opened on June 17. They indicated a cost of \$25,000,000 for construction.

Only one bid was received, however, on the first block of \$6,000,000 of bridge bonds, offered on July 8. This bid was rejected because of its conditional character. Other bond houses refused to bid until the legal and engineering features of the work were cleared up. There seemed to be grave doubt as to whether traffic over this bridge would meet costs and bond interest. The question of whether the district had the right to tax the counties affected to meet bond interest in the event of insufficient bridge revenues, was taken to the Supreme Court of California. On their approval of the bonds and the tax privilege paragraph on November 26, the case was taken into the district court. Opponents of the project stated that they did not object to the construction provided that it could be financed without taxation.

In the meantime, optional contracts had been awarded for the main construction, so as to avoid rejection of the bids, on the understanding that there would be a six months' delay in starting work.

**SAN FRANCISCO-OAKLAND BRIDGE.** Revised plans for a bridge to cross San Francisco Bay to Oakland, Calif., were approved by a special board of engineers on January 10. The main span was to be of the suspension type and elaborate tests of models were under way. One design involved two 2300-foot suspension spans, whereas an alternate plan consists of a single 3800-foot span. While this project was still in the preliminary stages many of the steps necessary to construction had been taken. A loan of \$65,000 was made by the State for preliminary studies and a contract for borings to determine foundation conditions was let in October. Amendments to the State Toll Bridge Authority also were passed in order to clear the way for financing and to provide for the work as part of the State highway system. The cost was estimated at \$78,000,000.

**NEW YORK CITY BRIDGES.** In addition to the work of the Port of New York Authority, the City of New York had not only undertaken the construction of the Tri-Borough Bridge to connect Manhattan, the Bronx, and Queens, but had also adopted special measures to increase the capacities of the four existing East River bridges. These bridges provided 40 lanes for traffic, of which 22 were designed for railroad tracks and 18 for vehicles. In 1922 two railroad lanes were reconstructed for highway traffic and in 1931 five additional vehicular lanes were provided—two on the Manhattan Bridge and three on the Queensborough.

The new Tri-Borough Bridge was under construction at an estimated cost of \$32,000,000. With Ward's Island as a centre its three arms will reach the three boroughs with the following types of construction:

	Vertical clearance	Span
<b>TO QUEENS</b>		
Hell Gate Suspension		
Span .....	135 ft.	1,380 ft.
<b>TO BRONX</b>		
Little Hell Gate		
2 steel arch spans, each .....	50 ft.	375 ft.
Bronx Kill		
2 spans, each .....	50 ft.	125 ft.
<b>TO MANHATTAN</b>		
Harlem River		
Vertical lift span .....	55 ft. 135 ft.	320 ft.

The total length of the three arms will be 17,700 feet, or over three miles.

**PITTSBURGH.** Two steel arch bridges, at McKees Rock and West End, across the Ohio, were nearing completion. The former is a braced-arch of the Hell Gate type with a span of 750 feet while the latter, located  $2\frac{1}{2}$  miles above, has a span of 778 feet. These two bridges, together with the George Westinghouse concrete arch bridge and the South Tenth Street suspension, will provide much needed facilities for the congested area of which Pittsburgh is the centre.

**CONCRETE BRIDGES.** Several interesting concrete bridges were under construction. The Martinez St. Bridge at San Antonio, Texas, is notable as the longest (101 ft.) single span rigid frame

bridge yet constructed. It is of ribbed design with unusually shallow ribs and the slab between ribs at the soffit is made integral with the ribs to provide a T-beam type of resisting section. Concrete designed to give 3000 lbs. per sq. in. compressive strength is used at the unusually high design stress of 1200 lbs. This span is particularly notable in that studies by the Westchester Parkway Commission, which first introduced this type of bridge in the United States, indicated an economical span limit of about 80 feet.

**ROGUE RIVER.** This interesting multiple arch structure on the Roosevelt Pacific coast highway, described in the 1930 YEAR BOOK, was scheduled for completion early in 1932. The Freyssinet method of construction was being used for the ribs of the bridge for the first time in the United States.

**SEATTLE.** The West Garfield St. Viaduct at Seattle, Wash., put in service about the beginning of the year, constitutes a major development in the traffic system of that city. It also involves unique features of reinforced concrete design. A heavy flat slab type of construction, consisting of a continuous one way slab, thickened for negative moment at the supports, constitutes the sole supporting element for spans up to 47 feet between bents. Interesting steel-reinforced concrete trusses are used for spans of 60 feet.

**GEORGE WESTINGHOUSE BRIDGE.** This concrete structure, over Turtle Creek at Pittsburgh, Pa., on the Lincoln Highway, will have the distinction of containing the longest concrete arch span in America, as noted in the 1930 YEAR BOOK. Five arches are required and the longest will be 460 feet. The trend toward lighter concrete construction in the United States is illustrated by the fact that the 42-foot roadway of this bridge is to be carried by only two ribs and that these ribs have a ratio of crown depth to span of only 1 to 80. The usual ratio has been at least 1 to 50.

**PONT DE LA CONCORDE.** This famous bridge over the Seine at Paris, the last work of Perronet, the most famous of French stone-arch bridge builders, has been widened to meet modern traffic needs. A new section, identical with the old construction, has been built on each side of the old bridge which has thus been made the widest bridge over the Seine and at the same time the beautiful arches of the historic structure, completed in 1791, have been retained.

**BRIDGE AWARDS.** The American Institute of Steel Construction continued their efforts to encourage the construction of bridges in America which would be both beautiful and economical to build. The award for Class A was given to the Wabash Ave., Chicago, bascule lift bridge over the Chicago River. No award was made in Class B, but for Class C, costing under \$500,000, the steel highway arch at Delton, Sauk County, Wis., received the prize.

**BIBLIOGRAPHY.** An interesting book has recently been published describing the many (over 50) Roman, Medieval, and Modern bridges which have been built over the Rhine. *The Bridges of the Rhine* by Karl Möhringer, Baden, 1931.

**BRIGHAM YOUNG UNIVERSITY.** A co-educational institution in Provo, Utah, founded in 1875 and maintained under the auspices of the Church of Jesus Christ of Latter-day Saints. It comprises a graduate school; colleges of arts and sciences, education, commerce, applied science, fine arts; and a division of research and extension. In the 1931 summer session, 545 stu-

dents were enrolled; the autumn session enrollment was 1205. The faculty numbered 103 members. The library contained 65,000 volumes and 50,000 pamphlets. The budget for the year was \$305,000. President, Franklin S. Harris, Ph.D.

**BRISTOL, CHARLES LAWRENCE.** An American biologist, died in Westerly, R. I., Aug. 27, 1931. He was born in Ballston Spa, N. Y., Sept. 29, 1859. On graduation from New York University in 1883, he was instructor in science at River-view Academy, Poughkeepsie, N. Y., during 1884-87, and professor of zoölogy at the University of South Dakota during 1887-91. After further graduate study at Clark University and the University of Chicago, he became in 1894 professor of biology at New York University, where he remained until 1925. During 1926-27 he was professor of biology on the University World Cruise. He also directed several zoölogical expeditions to Bermuda and had charge of the transportation of live tropical marine specimens to the New York Aquarium. His publications include *The Metamerism of Nephelids* (1889) and "Treasures of the New York Aquarium" in the *Century Magazine* (1899).

**BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.** An association founded in 1831 in York, England, incorporated by Royal Charter in 1928, and composed of 13 sections representing all branches of pure and applied science. In 1931 the association celebrated its centennial at a meeting in London September 23-30, under the presidency of Gen. Jan Christian Smuts, the South African statesman and philosopher. This meeting also accompanied the celebration of the Faraday centenary. See CELEBRATIONS. A commemorative service was held.

The address of the president at the opening session on "The Scientific World-Picture of Today" and the addresses of the presidents of the sections presented a broad survey of the progress of science and what is to be expected of it in the future. The section presidential addresses were as follows: Section A (mathematical and physical sciences), Sir Joseph J. Thomson on "The Growth in Opportunities for Education and Research in Physics during the Past Fifty Years"; Section B (chemistry), Sir Harold Hartley on "Michael Faraday and the Theory of Electrolytic Conduction"; Section C (geology), Prof. John Walter Gregory on "Geological Problems Contemporary with the British Association"; Section D (zoölogy), Prof. Edward B. Poulton on "A Centenary of Evolution"; Section E (geography), Sir Halford Mackinder on "The Human Habitat"; Section F (economics and statistics), Prof. Edwin Cannan on "The Changed Outlook in regard to Population, 1831-1931"; Section G (engineering), Sir Alfred Ewing on "Power"; Section H (anthropology), Prof. Alfred R. Radcliffe-Brown on "The Present Position of Anthropological Studies"; Section I (physiology), Dr. Henry H. Dale on "The Biological Nature of Filtrable Viruses"; Section J (psychology), Dr. Charles S. Myers on "The Nature of Mind"; Section K (botany); Prof. Thomas G. Hill on "The Advancement of Botany"; Section L (educational science), Sir Charles Grant Robertson on "Educational Development, 1831-1931"; and Section M (agriculture), Sir John Russell on "The Changing Outlook in Agriculture."

Among the important discussions at the meeting was that on the structure, evolution, and

possible disintegration of the universe, Sir James Jeans and Sir Arthur S. Eddington adhering to the "annihilation" theory, while exception to their view was taken by General Smuts, Sir Oliver Lodge, the Rt. Rev. Ernest William Barnes, Bishop of Birmingham, and Prof. Robert A. Millikan of the California Institute of Technology. The theory of "creative evolution" also resulted in a stirring debate between Prof. Julian S. Huxley, honorary lecturer at King's College, London, and Prof. Henry Fairfield Osborn of Columbia University, who contended that natural selection was only a partial explanation of adaptation, and Prof. Edward B. Poulton of Oxford, who defended Darwinism.

The association's annual meeting in 1932 was to be held in York, under the presidency of Sir Alfred Ewing, late principal and vice chancellor of the University of Edinburgh. The other officers elected for 1931-32 were: General secretaries, Prof. John L. Myres, Prof. F. J. M. Stratton, and Prof. Percy G. H. Boswell; general treasurer, Sir Josiah Stamp; and secretary, O. J. R. Howarth. Headquarters are in Burlington House, London, W. 1, England.

**BRITISH COLUMBIA.** A Canadian Province on the Pacific Ocean, bounded by Alaska, Yukon, and the Northwest Territories on the north, Alberta on the east, and the State of Washington on the south. Capital, Victoria.

The area is 355,855 square miles and the population was 689,210 at the census of 1931 (524,582 at census of 1921). The chief cities, with their census populations in 1931 were: Victoria, 38,441 (38,727 in 1921); Vancouver, 245,307 (163,220); and New Westminster, 17,524 (14,495). In 1929, births totaled 10,266; deaths, 6386; marriages, 5151. In the same year there were 1012 elementary schools, with 95,913 pupils; 32 superior schools, with 669 pupils; 79 high schools, with 14,545 pupils; 10 junior high schools, with 4797 pupils; and the Provincial University, with 1900 students.

The leading occupations—lumbering, mining, agriculture, manufacturing, and fishing—all registered declines in the value of output in 1930. The value of timber production was estimated at \$69,737,000 (\$32,773,000 lumber and \$16,520,000 pulp and paper), compared with \$93,301,000 in 1929. The gross value of mineral production was \$55,391,993, as against \$68,245,443 in 1929; silver, lead, and zinc production established new records but that of coal and other minerals declined. Metal prices were generally lower. Values of the chief minerals mined in 1930 were: Lead, \$12,535,931; copper, \$11,738,525; coal, \$9,435,650; zinc, \$9,010,093; silver, \$4,307,270; gold, \$3,475,811. Field crops in 1930 brought only \$16,628,000 (\$20,398,000 in 1929). The acreage sown to the principal crops in the spring of 1931 totaled 371,774 acres, as compared with 307,154 in 1921. The net value of manufactured products of British Columbia and the Yukon (1929) was \$132,286,208 (\$133,665,857 in 1928). The Province produces about two-fifths of the fish products of the Dominion; the value of the catch in 1930 was \$23,103,302 (chiefly salmon), as compared with \$23,930,692 in the previous year. Of the available water power, estimated at 6,000,000 horse power, 660,792 horse power were developed at the beginning of 1931. In 1929, the average weekly wage paid industrial workers was \$29.30 and 60 per cent of the employees were paid \$25 or more per week.

The gross value of mineral production in 1931 was estimated at \$36,567,300, a decline of \$18,824,693 from the 1920 output. Output of the principal minerals in 1931 was estimated as follows: Coal, \$8,500,000; lead, \$7,309,456; copper, \$5,554,225; zinc, \$5,230,386; gold, \$3,372,137; silver, \$2,331,096. Preliminary figures for the 1931 production of other primary industries were: Lumbering (including pulp and paper), \$51,500,000; agriculture, \$55,957,754; and fisheries, \$15,000,000.

In the fiscal year ended Mar. 31, 1930, provincial receipts totaled \$25,498,309 and expenditures \$25,086,980 (preliminary figures). The 1930-31 budget estimated receipts at \$28,115,000 and expenditures at \$28,073,000. Appropriations for 1931-32 amounted to over \$29,000,000. A provincial income tax, effective Apr. 1, 1931, levied 1 per cent on all incomes over \$15 a week in the case of single wage earners and over \$25 a week in the case of married wage earners. The gross funded debt on Mar. 31, 1929, was \$97,642,736; sinking funds, \$18,568,711. Surveys of a road project to connect Hazelton, the northern terminus of the British Columbia highway system, with the Alaskan border through the Yukon territory, were carried forward in 1930.

Government is under a lieutenant-governor and legislative assembly of 48 members elected for five years. In the Dominion Parliament the Province is represented by 6 Senators and 14 members of the House of Commons. Lieutenant-Governor in 1931, John W. F. Johnson, who was appointed July 19, 1931, to succeed Robert R. Bruce. Premier and Minister of Railways, S. F. Tolmie. In the Dominion general election of July 28, 1930, the Province returned 7 Conservatives, 5 Liberals, 1 Laborite, and 1 Independent to the House of Commons. See CANADA.

**HISTORY.** An agitation for restriction of immigration from the Orient gained momentum in 1931. Federal action to meet the situation was demanded by the British Columbia representatives in the Dominion Parliament on April 10. There were 28,000 Japanese and 26,000 Chinese in the Province, they reported, and while the Chinese were decreasing in number the Japanese in the preceding five years had increased by 8270 (6000 by natural increase and 2270 by immigration). In 1929, there were 12,253 Asiatics employed in the Province, or slightly more than one-tenth of the total employed population. Salaries of provincial officials and employees were reduced by from 2 to 10 per cent under an economy measure announced by the government on Oct. 11, 1931.

**BRITISH EAST AFRICA.** A British possession covering a large area of Africa, and comprising KENYA Colony and Protectorate, UGANDA Protectorate, ZANZIBAR, and the mandated territory of TANGANYIKA (formerly German East Africa). See these articles. Hearings on the proposed administrative union of Kenya, Tanganyika, and Uganda (see 1930 YEAR BOOK) were continued before a special Joint Parliamentary Committee in London during 1931.

**BRITISH EMPIRE.** An empire consisting of: (1) GREAT BRITAIN and NORTHERN IRELAND, CHANNEL ISLANDS, and ISLES of MAN (2) the IRISH FREE STATE, INDIA, and the various British Dominions, Colonies, Protectorates, and Dependencies. Consult these articles. Including the mandated territories of PALESTINE, SOUTH-WEST AFRICA, CAMEROON, TOGO LAND, WESTERN SAMOA, and NAURU, the British Empire has a total area

of 13,355,426 square miles, or about 26 per cent of the area of the world (51,723,000 square miles excluding polar regions). The population according to the 1921 census was approximately 449,583,000, or about 26 per cent of the estimated world population of 1,811,000,000 in 1920.

**BRITISH GUIANA**, *gè-à-nà*. A British colony on the northeastern coast of South America, including the settlements of Berbice, Demerara, and Essequibo; bounded on the east by Dutch Guiana, on the south by Brazil, and on the west by Venezuela. Area, 89,480 square miles; population, according to the census of 1921, 297,691, excluding about 97,000 aborigines. Estimated population in 1931, 312,000, including about 130,000 East Indians. In 1929 births totaled 9824 and deaths 7281. Georgetown, the capital, had 57,560 inhabitants. Elementary schools receiving Government aid in 1929 numbered 212, with 44,816 pupils.

Sugar is the principal crop, accounting normally for one-half the total value of exports. The sugar output (1930-31) was 115,000 tons from 56,126 acres. Rice, coffee, cacao, and limes are other leading crops. Cattle raising, mining, and lumbering are subsidiary occupations. Cattle in 1929 numbered 153,639. The gold production (1929) was valued at £27,124; diamonds, £471,746. British and Dutch Guiana together supply more than one-fifth of the world's production of bauxite, from which aluminum is extracted. Manganese and mica are also found. The forested area of 78,000 square miles produces hardwoods and balata (gum). Imports in 1930 were valued at £1,597,361 and exports at £2,021,543, compared with £2,215,715 and £2,556,571, respectively, in 1929. Canada and the United Kingdom were the leading markets.

In 1929, revenues amounted to £1,252,322 and expenditure to £1,126,218. Preliminary returns for 1930 and 1931, however, indicated budget deficits, due to the sugar crisis. The funded public debt on Jan. 1, 1930, was £4,770,191. Accounts are kept in dollars and cents and both British and United States coins are in circulation. Vessels entered and cleared at the ports in 1929 numbered 2860, of 1,324,312 tons (2569 of 1,060,534 tons in 1928). There are 88 miles of railway, 427 miles of motor highways, 39 miles of canals, and 450 miles of navigable rivers. The colony is administered by a governor, assisted (since July 18, 1928) by a legislative council. Governor in 1931, Sir Edward Brandis Denham, who assumed office in June, 1930.

**HISTORY.** The desperate financial condition of the colony resulting from the collapse of sugar prices in 1929, 1930, and 1931, caused the British Secretary of State for Colonies to appoint a commission early in 1931 to study conditions in the colony and submit recommendations for balancing the budget. The Legislature passed a resolution reducing the salary of the Governor from £3000 to £2000. The centenary of the proclamation of the colony of British Guiana was observed in July, 1931.

**BRITISH HONDURAS**, *hòn-dôo-raa*. A British Crown colony on the Caribbean coast of Central America, east of Guatemala, and 700 miles west of Jamaica; sometimes referred to as Belize. Area, 8598 square miles; population, according to the census of 1921, 45,317; estimated, Jan. 1, 1930, at 51,228. Chief town and capital, Belize (population, 1921, 12,661). In 1929, there was a total school enrollment of 8520 and an average

attendance of 6732. The chief pursuits are agriculture and forestry, although only a small part of the land is cultivated. In the higher lands, good pasturage is to be found.

The principal exports are bananas, mahogany, logwood and other forest products, plantains, coconuts, and chicle. The bulk of the colony's trade is with the United States. In 1929, the foreign trade totaled \$9,933,548, the largest on record and 16 per cent greater than in 1928. Exports were valued at \$4,876,875 (including re-exports of \$2,951,666) and imports at \$5,056,673. Revenue for the fiscal year 1929-30 amounted to £213,183 and expenditure £210,618. The public debt was £384,652. Ships entering the ports in 1929 aggregated 312,518 tons (291,451 tons in 1928). There are 25 miles of railway. Wireless communication is maintained with New Orleans and Jamaica. Planes used in the daily air-mail and passenger service between Miami, Fla., and Cristobal, Canal Zone, stop overnight at Belize. The United States gold coins are the standard of currency. The administration is under a governor assisted by an executive council of six members and a legislative council of six official and seven unofficial members. Governor and Commander-in-Chief in 1931, Sir J. A. Burdon.

**HISTORY.** The city of Belize was virtually destroyed by a hurricane and tidal wave on Sept. 10, 1931, with a loss of between 800 and 1000 lives, including 12 American citizens. Fires in the suburbs of the ruined city increased the damage. Food riots occurred following the hurricane and on September 13 United States Marines and sailors took over the enforcement of martial law to relieve the exhausted local police. In October, the British Colonial Office reported that 2370 families were still dependent upon the Government for support.

**BRITISH INDIA.** See INDIA.

**BRITISH MALAYA.** British Malaya includes the Straits Settlements, the Federated Malay States, and the Non-Federated Malay States. The total area is 56,603 square miles; the total population was estimated at 3,864,413 in 1928 (3,358,054 at census of 1921). Three other British protectorates in Malaysia—British North Borneo, Brunei, and Sarawak—are seldom included in the term British Malaya and are never covered by British Malayan statistics. Singapore, with a population of 350,355 in 1921, and Penang, with 123,069 in 1921, are the chief cities. For the component native states of the several protectorates and their respective statistics, see STRAITS SETTLEMENTS, FEDERATED MALAY STATES, NON-FEDERATED MALAY STATES, BRITISH NORTH BORNEO, BRUNEI, and SARAWAK.

**BRITISH MUSEUMS.** See ART MUSEUMS.

**BRITISH NEW GUINEA.** See PAPUA.

**BRITISH NORTH BORNEO.** A British protectorate, comprising the northern part of the island of Borneo (q.v.). Area, about 31,106 square miles; population, at the census of 1921, 257,804, most of whom were Mohammedan settlers in the coast regions and aborigines in the interior. Europeans numbered only 533. The chief towns are Sandakan, with a population of 11,936, on the east coast, and Jesselton, on the west coast. Finance and trade statistics for 1929, with 1928 figures in parentheses, were: Revenue, £449,463 (£453,629), expenditure, £262,446 (£261,370); imports, £1,137,825 (£1,186,262); exports, £1,536,223 (£1,523,057). A railway runs from Jesselton to Melalap 127 miles in the in-

terior. The territory is under the jurisdiction of the British North Borneo Company and is administered by a governor in Borneo and a board of directors in London. Governor in 1931, A. F. Richards (appointed February, 1930).

**BRITISH SOMALILAND.** See **SOMALILAND PROTECTORATE.**

**BRITISH SOUTH AFRICA.** See **SOUTH AFRICA, UNION OF.**

**BRITISH WEST AFRICA.** The general name given to the following British colonies in West Africa; Nigeria (colony and protectorate); Gambia (colony and protectorate); Gold Coast (comprising the Gold Coast colony, Ashanti, and the Northern Territories); Sierra Leone (colony and protectorate). The British mandated territories in Togoland and the Cameroons are also included. Consult the separate articles.

**BRITISH WEST INDIES.** A number of scattered island possessions of the British Empire in the West Indies, including (1) the Bahamas, (2) Jamaica and small adjacent islands, and (3) the islands along the east of the Caribbean Sea and near the coast of South America, including the Leeward group, the Windward group, Trinidad, Tobago, and Barbados. The islands have an aggregate area of 12,239 square miles and a population of slightly more than 1,900,000.

The collapse of sugar prices in 1930 and 1931 brought the sugar industry, which is the main dependence of the islands, to the verge of ruin. The British Secretary of State for Colonies during 1931 studied proposals for a closer political union of Trinidad, the Leeward, and Windward Islands with a view to reducing the costs of administration. Also a loan of £124,000 was advanced to aid the colonies in unemployment relief works. Delegates of Barbados, British Guiana, Trinidad, and the Leeward and Windward Islands met at Port of Spain, Trinidad, June 10, 1931, to consider trade relations with Canada and joint action in negotiating reciprocity with Australia. See separate article on each island on group.

**BROOKINGS INSTITUTION.** An organization devoted to public service through research and training in the social sciences, established in Washington, D. C., in 1927. Its purposes are: To aid constructively in the development of sound national policies, and to offer training of a super-graduate character to students of the social sciences. It maintains, as operating units, the Institute of Economics, the Institute for Government Research, and a division of training in which only those who have already received the Ph.D. degree, or an equivalent training, are accepted as research fellows. It also provides headquarters for visiting scholars who come to the national capital to make use of the material available there on economic, political, historic, social, administrative, and legal problems, as found in library collections and in the records of the various government departments.

By charter provision the investigations of the institution are conducted "without regard to the special interests of any group in the body politic, whether political, social, or economic." During 1931 the following studies were completed: *War Debts and World Prosperity*; *The Balance of Births and Deaths* (vol. ii, *Eastern and Southern Europe*); *The Cuban Situation and Our Treaty*

*Relations; Japan—An Economic and Financial Appraisal*; *The New Industrial Situation and American Labor*; *The Radio Industry*; *Financial Condition and Operations of the National Government, 1921–30*; and *Publication Work of the National Government.*

The institution is supported from endowment funds and annual grants. The board of trustees, a self-perpetuating body, has general responsibility for determining the institution's policies and its programme of work, but does not assume responsibility for each particular investigation. The officers of the board of trustees for 1930–31 were: Chairman, Robert S. Brookings, founder of the institution; vice chairman, Leo S. Rowe; treasurer, Frederic A. Delano; and president, Harold G. Moulton. Headquarters are at 722 Jackson Place, Washington, D. C.

**BROOKLYN INSTITUTE OF ARTS AND SCIENCES.** An institution in Brooklyn, N. Y., composed of four divisions—education, museum of arts and sciences, children's museum, and a botanic garden. It was founded in 1824 and incorporated in its present form in 1890. Membership is open to all who are interested in any branch of science or art. The education division is divided into the following departments, composed of members interested in a particular field: Agriculture, astronomy, botany, dramatic art, electricity, fine arts, geography, geology, home economics, music pedagogy, philology, philosophy, photography, physics, political science, psychology, and sociology. These departments conduct courses and sponsor addresses, lectures, and concerts. A forum conducted by the departments of political science and sociology provides for the discussion of current problems. The enrollment in the school of pedagogy in 1931 was 2240, with an attendance at lectures of 304,292. The institute's museums contain collections in the fields of art, ethnology, and natural science; its botanic garden comprises more than 50 acres. Attendance at the museums during the year was 1,155,051 and at the botanic garden, 1,006,027. The library contained more than 27,000 volumes. In 1931 the permanent funds of the institute amounted to \$3,062,372; the funds to meet current expenses totaled \$556,188. The president of the board of trustees was Edward C. Blum; director of the division of education, Charles D. Atkins; of the museum of arts and sciences, William Henry Fox; of the children's museum, Anna B. Gallup; and of the botanic garden, C. Stuart Gager. Headquarters are at the Brooklyn Academy of Music, 30 Lafayette Avenue, Brooklyn N. Y.

**BROOKLYN MUSEUM.** See **ART EXHIBITIONS; ART MUSEUMS.**

**BROWN UNIVERSITY.** An institution of higher education in Providence, R. I., founded in 1764. It includes an undergraduate college for men, Pembroke College in Brown University (for undergraduate women), the graduate school, and the division of university extension. The enrollment in the autumn of 1931 was 1280 undergraduate men, 490 undergraduate women, 338 graduate students, and 78 special students in education. The faculty consisted of 251 members, including 113 professors, 59 instructors, 13 lecturers, 65 assistants, and 1 associate. Among the new appointees were: Albert J. Farmer, visiting professor of French language and literature; Arthur E. Murphy, professor of philosophy; James B. Hedges, George L. Littlefield professor of American history; Clinton H. Currier, as-

sistant dean of undergraduates; and Bruce M. Bigelow, acting director of admissions. The total of the productive funds of the university on June 30, 1931, was \$10,287,930. The total income from these funds was \$515,604. The libraries contained approximately 400,000 volumes. The Saunders Collection of Walt Whitman was acquired for addition to the Harris Collection of American Poetry, which already included approximately 80,000 items, as a gift from Webster Knight. Faunce House, the gift of John D. Rockefeller Jr., in memory of former President William H. P. Faunce, was completed to house undergraduate social and religious activities and undergraduate organizations. President, Clarence Augustus Barbour, D.D., S.T.D., LL.D.

**BRUCE, MAJ. GEN. SIR DAVID.** A British army surgeon and authority on tropical diseases, died in London, Nov. 27, 1931. He was born in Melbourne, Australia, May 29, 1855, and attended Edinburgh University. He became a surgeon in the Royal Army Medical Corps in 1883 and served in Malta and Egypt until 1889. He was then appointed assistant professor of pathology at the Army Medical School in Netley, Hampshire. From 1894 to 1901 he served in South Africa, having been asked by the Government of Natal to investigate the diseases known as *nagana*, prevalent among live stock, and tsetse fly disease or sleeping sickness, found in human beings. He discovered that those were one and the same and that both were dependent upon the presence in the blood of a protozoan organism known as *trypanosome*, the tsetse fly acting as carrier from a diseased animal to a healthy one. While in South Africa he was present at the siege of Ladysmith and was promoted to surgeon major in 1895 and lieutenant colonel in 1900. He was a member of the Army Medical Advisory Board from 1902 to 1911 and editor of the *Royal Army Medical Journal* from 1904 to 1908. In 1903, and again in 1908, he went to Uganda as director of the Royal Society's commission for the investigation of sleeping sickness, his researches proving that two varieties of the tsetse fly, the *glossina palpalis* and *glossina morsitans* were the carriers in this disease which was caused by a blood parasite, the *trypanosoma gambiense*. He visited Malta during 1904-06 as director of the Royal Society's commission for the investigation of Mediterranean fever and discovered the organism *micrococcus melitensis*; he had previously discovered (1887) that the medium of infection was contaminated food or drink, usually goats' milk. During 1911-14, as director of another commission in Nyasaland, Africa, he did valuable research upon the connection between diseases of wild animals and human and live stock diseases. In 1912 he was specially promoted to major general.

From 1914 until his retirement in 1919 Sir David was commandant of the Royal Army Medical College, and in 1924-25 was colonel commandant of the Royal Army Medical Corps. During the World War he was chairman of the War Office's pathological committee and committees for the study of tetanus and trench fever. He was a member of numerous learned societies, both British and European, and received many honorary degrees and scientific awards. He was also chairman of the governing body of the Lister Institute (1916) and president of the Royal Society of Tropical Medicine and Hygiene (1917-19) and of the British Association for

the Advancement of Science (1924). In 1905 he was made a Companion of the Bath; in 1908, a Knight; and in 1918, a Knight Commander of the Bath.

**BRUNEI, brōo-nī.** A British protectorate on the northwestern coast of the island of Borneo (q.v.). Area, about 2500 square miles; population at census of 1921, 25,454 (35 Europeans). Brunei, the chief town, has about 12,000 inhabitants. Mangrove extract, rubber, sago, and jelutong are the chief products. Revenue in 1930 totaled \$333,069; expenditure, \$379,604; public debt, \$401,000. Exports in 1930 were \$807,449; imports, \$2,530,422. Figures are in Straits dollars, which exchanged at about \$0.56 U. S. in 1930. Sultan in 1931, Ahmed Tajudin Akhazul Khairi Waddin, a minor, who receives an annual allowance of £1400 from state funds. Government is administered by the British resident. Resident in 1931, P. A. B. McKerron.

**BRUNSWICK, brūnz'wīk.** A state of the German Republic. See GERMANY under *Area and Population and History*.

**BRYCE, GEORGE.** A Canadian clergyman, educator, historian; died in Ottawa, Ont., Aug. 5, 1931. He was born at Mount Pleasant, Brantford, Ont., Apr. 22, 1844, and attended the University of Toronto and Knox College, Toronto. Having been selected by the Presbyterian Church of Canada for the task, he organized Manitoba College in 1871, and served until 1909 as professor of English literature. He also organized Knox and St. Andrew's churches in Winnipeg in 1871-72, and was first moderator of the Synod of Manitoba in 1885 and moderator of the General Assembly of the Presbyterian Church in Canada in 1902-03. He was a founder of the University of Manitoba in 1877 and a counselor and examiner until 1907. From 1891 to 1904 he also was head of the faculty of science and a lecturer in biology and geology. He served on the Commission on Conservation of Canadian Resources and on the Royal Commission on Technical Education. In 1909 he was president of the Royal Society of Canada. Among his works are: *Manitoba: Infancy, Progress, and Present Condition* (1882); *The Apostle of Red River* (1898); *The Remarkable History of the Hudson's Bay Company* (1900); *Everyman's Geology of Western Canada* (1907); *The Romantic Settlement of Lord Selkirk's Colonists* (1909); *The Life of Lord Selkirk* (1912); and *A Short History of the Canadian People* (1913).

**BRYN MAWR COLLEGE.** An institution for the higher education of women in Bryn Mawr, Pa., founded in 1885. The enrollment for the autumn of 1931 totaled 491. The teaching staff numbered 82. The productive funds of the college amounted to \$6,742,134 in the autumn of 1931, and the receipts for the year 1930-31 were \$939,816. The number of volumes in the library was 135,000. President, Marion Edwards Park, Ph.D., LL.D.

**BUCKNELL UNIVERSITY.** A coeducational Baptist institution of higher learning in Lewisburg, Pa., founded in 1840 under the name of University of Lewisburg but renamed in 1886 in honor of its benefactor, William Bucknell. In the autumn of 1931 the enrollment was 1111, of whom 724 were men and 387 woman. Of the 447 students enrolled in the summer session of 1931, 260 were men and 187 were women. The faculty numbered 71. The productive funds amounted to \$1,700,000 and the income for the year was

\$700,000. The library contained 55,000 bound volumes. President, Homer Price Rainey, Ph.D.

**BUCKWHEAT.** According to estimates by the Department of Agriculture the buckwheat crop of the United States in 1931 amounted to 8,875,000 bushels as compared with 6,962,000 bushels in 1930, a gain of about 27 per cent. In the buckwheat States within the 1930 drouth area a marked increase over the small crops of the preceding year was recorded. In 1931 the crop was reduced in some of the North Central States due to dry weather. The acreage in 1931 was only 502,000 acres while in 1930 it was 573,000 acres and in 1929, 627,000 acres. The average yield per acre in 1931 was 17.7 bushels, or 5.5 bushels above that of the preceding year. At the unusually low average farm price of 42.4 cents per bushel on December 1 the total farm value of the 1931 crop was only \$3,765,000 as compared with \$5,814,000 the year before when the price per bushel was 83.5 cents.

Production of the crop was reported by 23 States and among the more important producing States Pennsylvania yielded 3,483,000 bushels, New York 2,844,000 bushels, Ohio 480,000 bushels, West Virginia 410,000 bushels and Minnesota 264,000 bushels. These States yielded over 80 per cent of the crop. During the fiscal year ended June 30, 1931 the United States exported 85,000 bushels of buckwheat valued at \$64,000.

A number of experiments were conducted during the year to improve the crop and its products. Artificial drying trials conducted by the Department of Agriculture in cooperation with the North Dakota Experiment Station showed that the moisture content of the grain could be reduced from 18 per cent to 14 per cent in from 40 to 60 minutes at a cost of about 1.5 cents for fuel per bushel. Experiments elsewhere indicated the value of the liberal use of phosphate fertilizer in growing the crop.

**BUFFALO, THE UNIVERSITY OF.** A coeducational institution of higher learning in Buffalo, N. Y., founded in 1846 under a charter received from the State Legislature. The enrollment for the autumn of 1931 was distributed as follows: College of arts and sciences, 782; school of law, 215; school of dentistry, 164; school of medicine, 273; school of pharmacy, 168; school of business administration, 216; evening session, 1809. The enrollment for the 1931 summer session was 959. The faculty numbered 428, including 40 new appointees. The income for the year 1930-31, exclusive of gifts, amounted to \$950,125, while the endowment fund balance as of June 30, 1931, was \$4,842,847. The library contained 81,000 volumes and 73,032 pamphlets. Chancellor, Samuel P. Capen, Ph.D., L.H.D., Sc.D., LL.D.

**BUGS.** See ENTOMOLOGY, ECONOMIC.

**BUILDING.** According to *Bradstreet's* annual summary, the value of the building for which permits were granted in 215 cities in the United States was greatly curtailed during 1931. In this year building was at its lowest ebb since March, 1919, and followed the trend of general business throughout the United States, being further influenced by the prospect of increased taxes which, with the general economic situation, contributed to slowness in real estate operations, foreclosures, and the tightening up of mortgage finances. In the month of December the lowest point of value of permits, namely, \$47,582,316 was reached as compared with \$109,884,-

513 in December, 1930, and \$57,604,868 in November, 1931. The shrinkage was consistent during the year.

This decline in building ordinarily would have been difficult to understand in view of the fact that the United States was in need of a million and a quarter homes and there was a general sentiment in favor of home building. A study of census figures had shown in many localities, particularly in and around New York City, an increase in the population which was far in excess of actual home construction of all kinds. In New York City the permits for the entire 12 months of 1931 amounted to \$355,737,349, as against \$408,741,972 in 1930, and \$943,957,239 in 1929. In the 215 cities of the United States the permits in 1931 aggregated \$1,158,963,273 in 1931 as against \$1,672,182,351 in 1930 or a decline of 30.7 per cent. Outside of New York City the total permits aggregated \$803,225,924 in 1931, as against \$1,263,440,379 in 1930 or a decline of 36.4 per cent. In 14 cities of Canada building permits in 1931 totaled \$88,885,602 as against \$128,428,110 in 1930 or a decline of 30.8 per cent.

According to *Bradstreet's* the prospect of additional taxation was hindering really improvements in New York, Philadelphia, and Chicago, and unquestionably had its influence in the diminished number of permits applied for in any of these cities, Chicago showing a decline from \$79,604,950 in 1930 to \$46,444,030 in 1931 or 41.6 per cent. Philadelphia showed a decline

New York City ..	355,737,349	408,741,972	-13.0
Outside New York City .....	803,225,924	1,263,440,379	-36.4
Canada (14 cities)	88,885,602	128,428,110	-30.8

from \$55,267,390 in 1930 to \$35,126,060 in 1931 or a reduction of approximately 36.4 per cent.

The table on page 125 gives the building permit values at the leading cities of the United States in the calendar year 1931 as compared with 1930.

In the following table will be found comparisons for 120 identical American cities for 1931 and previous years back to 1911:

Year		Year	
1931	\$1,005,626,000	1920	\$1,255,808,000
1930	1,407,833,000	1919	1,181,251,000
1929	2,489,553,000	1918	374,081,000
1928	2,795,229,000	1917	641,100,000
1927	2,870,512,000	1916	926,647,000
1926	3,230,414,000	1915	770,010,000
1925	3,886,043,000	1914	730,519,000
1924	2,907,529,000	1913	808,069,000
1923	2,832,439,000	1912	877,924,000
1922	2,811,915,000	1911	821,717,000
1921	1,493,464,000		

The 1931 construction value in the United States, according to the F. W. Dodge Corporation's Review of Building and Engineering Activity, again showed a decline in value of contracts awarded in the 37 States east of the Rocky Mountains, the total for the year being \$3,092,849,500 as against \$4,523,114,600 in 1930, and \$5,754,291,000 in 1929. These figures, in the

struction projects of the 37 States east of the Rocky Mountains in 1931 as distributed in the various types of construction are indicated in the accompanying table.

#### CONSTRUCTION VALUE IN THE 37 STATES EAST OF THE ROCKY MOUNTAINS, 1931

[From F. W. Dodge Corporation]

Types of construction	1931
Commercial buildings	\$ 819,877,200
Factories	116,157,000
Educational buildings	228,777,000
Hospitals and institutions	121,193,300
Public buildings	181,266,600
Religious and memorial	59,099,600
Social and recreational	98,746,500
<b>Total nonresidential</b>	<b>\$1,118,617,200</b>
One- and two-family houses	574,426,300
Apartments and hotels	236,962,400
<b>Total residential</b>	<b>\$ 811,888,700</b>
Public works and utilities *	1,162,843,600
<b>Total construction</b>	<b>\$3,092,849,500</b>

\* Public works and utilities, inclusive of highways, bridges, power plants, water and sewage systems, etc.

An interesting table compiled by the same corporation showing the distribution of construction by territories for the year 1931 is given herewith.

#### CONTRACTS AWARDED BY TERRITORIES—YEAR 1931

[F. W. Dodge Corporation]

Territory	Residential building	Non-residential building	Public works and utilities	Total construction
New England	\$ 87,548,200	\$ 120,417,200	\$ 87,053,900	\$ 295,019,300
Metropolitan New York and vicinity	297,458,600	270,979,900	156,622,900	725,061,400
Upstate New York	26,014,000	68,646,700	75,057,300	169,718,000

\* Estimated additions to the figures for the 37 Eastern States to cover the 11 Western States were based upon the relationship between these two major areas as adduced both from building permit valuations and the contract figures on heavy construction as reported by the *Engineering News-Record*. Thus for building, both residential, and non-residential, 11 per cent was added to the figures for the 37 States to cover the work in the 11 Western States; while for public works and utilities 16 per cent was added to cover the Western States. Low cost new and alteration projects were estimated to have shown a loss of 29 per cent in valuation from the year 1930.

<sup>b</sup> Principally small houses; includes new buildings, modernization projects, remodeling, alterations, additions, etc., valued at under \$5,000 per project. This class of construction was estimated at \$829,000,000 for the year 1930.

range of contract records, covered 110,203 projects involving a total of 365,840,200 sq. ft. If, in addition to the 37 States east of the Rocky Mountains, for which this corporation maintains carefully recorded statistics, figures to cover the 11 Western States on a basis of estimated additions were added, this amount would be increased to \$3,491,205,200, and if to this total were added miscellaneous low cost projects, including new buildings, modernization projects, remodeling, alterations, etc., under \$5000 per project, or a total of \$589,000,000, a grand total of \$4,080,205,200 would be obtained. The con-

The summaries of construction compiled by the *Engineering News-Record*, New York, indicated for the year 1931 total engineering construction of \$2,454,176,000 as compared with \$3,173,259,000 in 1930, or a drop of 23 per cent in money value. This, however, must be considered in view of materially lower construction costs permitting a larger amount of construction per dollar than in 1930 and indeed in any other year since 1922. The *Engineering News-Record Cost Index* at the end of 1930 was 194.48 as compared with 162.48 at the end of 1931, or a decrease of 16½ per cent during the year and

an average of 8 per cent for the year. During 1931 there was an increase in public works construction over the previous year, waterworks, bridges, and especially Federal Government work showing a considerable increase. Road-making fell 8 per cent below and public buildings 16 per cent below, but a gain for all public works was indicated by 2 per cent. The decline in building of the previous three years continued, with a value of new industrial buildings only half that of 1930 which in turn was 40 per cent below the record year 1929. Commercial building was 46 per cent below that of 1930 which was 33 per cent below 1929. Residence building also declined and all other private construction, including public utility works, decreased 25 per cent. The drop in private construction was 42 per cent. The accompanying table gives construction by classes and geographical divisions as compiled by *Engineering News-Record* in millions of dollars.

See ARCHITECTURE.

**BULGARIA.** A constitutional monarchy in the Balkans lying to the south of Rumania and bounded on the west by Yugoslavia and on the south by Greece and European Turkey. Capital, Sofia; reigning King in 1931, Boris III, who succeeded to the throne upon the abdication of his father, Oct. 3, 1918.

**AREA AND POPULATION.** As a result of the World War, the area of Bulgaria was reduced from 53,305 to 39,814 square miles. The population according to the census of 1926 was 5,483,125, as compared with the 1920 census population of 4,846,971. The estimated population on Jan. 1, 1930, was 5,824,900. In 1929, preliminary figures showed 173,272 living births, 102,470 deaths, and 55,731 marriages. The chief cities, with their populations at the 1926 census, are: Sofia, 213,002; Philippopolis (Plovdiv), 84,656; Varna, 60,563; Ruschuk (Ruse), 45,788; and Slivno (Sliven), 29,263.

**EDUCATION.** Primary education is free and compulsory for children between the ages of 7 and 14. In 1928-29, there were 7201 schools of all descriptions, with 26,404 teachers and 742,082 pupils. Of these, 4383 national elementary schools had 483,982 pupils and 1035 private elementary schools, 60,510. The State University at Sofia had 325 instructors and 4508 students. En-

rollment of the American College at Sofia in 1931 was placed at a total of 444 students.

**PRODUCTION.** Nearly 80 per cent of the population is directly or indirectly dependent upon agriculture. The cultivated land, totaling about 9,182,400 acres, is widely distributed among small proprietors in plots of from one to six acres. Machinery is gradually replacing primitive methods of cultivation. About 7,203,160 acres are forested. With the exception of tobacco, the chief export crop, practically all crops returned larger yields in 1930 than in 1929. The sharp decline in agricultural prices more than offset this advantage, however, and the condition of the peasantry became increasingly grave during 1930 and 1931. The tobacco yield was 52,910,000 pounds in 1930, compared with 55,054,000 pounds in 1929, but exports were approximately the same. About 6,646,195 acres were devoted to cereals (6,461,955 acres in 1929) and the 1930 harvest showed a 40 per cent increase. The estimated production, in metric tons, in 1930, with figures for 1929 in parentheses, was: Wheat, 1,586,000 (903,000); corn, 865,000 (940,000); barley, 412,000 (204,000); rye, 344,000 (186,000); oats, 145,000 (140,000); maslin (mixed grain), 123,000 (88,000); spelt, 14,000 (6200); rice, 13,000 (13,000); and millet, 11,000 (37,000). Other crops, in metric tons, were: Sugar beets, 312,000 (262,000); sunflower seed, 70,500 (60,000); rapeseed, 14,600 (150); sesame, 3000 (2130). Silk cocoon production was estimated at 2330 metric tons (2389 in 1929); attar of roses, 73,500 ounces (70,500).

Industry is relatively unimportant, the principal lines being leather, wood and furniture, ceramics, and woolen textiles. The National Bank estimated that industry was from 30 to 40 per cent less active in 1930 than in 1929. Coal production was estimated at 1,573,200 tons (1,651,820 tons in 1929). Copper, lead, zinc, aluminum, and salt are other mineral products. There are several state monopolies, of which the manufacture of tobacco is the most important.

**COMMERCE.** Foreign trade in 1930 resulted in an export surplus for the first time in three years, due chiefly to a 45 per cent decline in the value of imports, whereas exports declined only 3.2 per cent. Imports were valued at 4,590,000,000 leva (about \$33,000,000), compared with 8,325,000,000 leva (\$59,900,000) in 1929. Exports totaled 6,191,000,000 leva (about \$44,800,000), as against 6,397,000,000 leva (about \$46,100,000) in the previous year. The favorable balance of trade was 1,601,000,000 leva, as compared with an adverse balance of 1,928,000,000 leva in 1929. The lev (plural leva) was stabilized Nov. 22, 1928, at \$0.0072. Price declines were reflected in the fact that while the volume of 1930 exports increased 73.3 per cent over 1929, the value was slightly less. The volume of imports declined 37.6 per cent.

Imports came principally from Germany, which supplied 23.2 per cent (22.2 in 1929); Italy, 13.6 (10.7); Czechoslovakia, 9.4 (9.0); France, 9.3 (8.2); Great Britain, 8.2 (8.9); and Rumania, 8.0 (7.1). Germany took 26.2 per cent of the 1930 exports (29.9 in 1929); Poland, 10.2 (8.2); Italy, 8.3 (10.5); Austria, 7.7 (12.5); Czechoslovakia, 6.4 (4.8); and France, 5.2 (5.1). Imports from the United States were valued at \$623,000, or 1.9 per cent of the total, and exports to that country were \$458,000, or 1.7 per cent. Preliminary returns for 1931 placed

imports at 4,641,770,000 leva and exports at 5,959,070,000 leva, leaving a favorable trade balance of 1,317,300,000 leva.

**FINANCE.** Preliminary results of the budget for the fiscal year ended Mar. 31, 1931, showed a deficit of 1,074,500,000 leva (about \$7,636,400), according to a report of the Minister of Finance. The budget had been calculated to balance at 7,000,000,000 leva, but receipts for the year amounted to only 5,676,273,000 leva, compared with 6,286,084,000 for the preceding fiscal year, a decline of 9.7 per cent. Railway receipts were 1,160,248,000 leva, as against 1,258,002,000 in 1929-30, a 7.8 per cent decline.

The budget estimates for 1931-32 balanced at 6,400,000,000 leva, representing a reduction of 8.6 per cent from the estimates for 1930-31. By virtue of the Hague reparation agreement signed Jan. 20, 1930, the Bulgarian reparation debt was fixed, as of Apr. 1, 1930, at 171,637,910 gold francs (1 gold franc equals \$0.0392), payable in 30 years at 5½ per cent interest. The occupation debt was suppressed under the same convention. The total national debt on Jan. 1, 1931, was 1,017,467,755 gold francs, or 27,362,957,260 leva. On the same date, the Treasury owed the National Bank 3,161,845,800 leva (3,470,302,000 leva at the beginning of 1930).

**COMMUNICATIONS.** Bulgarian railways, all state owned, and operated, reported about 1813 miles of line, of which 298 miles were narrow gauge. Freight traffic in 1930 declined to 348,750 carloads from 362,200 in 1929 and 330,000 in 1928. There were about 9623 miles of highway, of which 4643 miles were state and 4980 miles communal roads. A total of 12,825 vessels and barges of 2,505,435 net registered tons called at Bulgaria's Danube ports during 1930 (12,707 of 2,568,720 tons in 1929). The principal seaports are Bourgas and Varna on the Black Sea. In 1930, 480 steamers of 793,340 tons entered and cleared at Bourgas (435 of 742,410 tons in 1929), while 367 of 641,250 tons entered and cleared at Varna (365 of 632,310 tons in 1929).

**GOVERNMENT.** The King is the head of the government, assisted by a council of ministers nominated by him, and a single legislative chamber, known as the *Sobranie*, composed of 273 members. The parties in the *Sobranie*, elected in May, 1927, contained the following party groups: Government Coalition, 168; Agrarians, 48; Macedonian Independents, 11; National Liberals, 14; Democrats, 12; Radicals, 2; Social Democrats, 10; others, 8. The Ministry formed May 16, 1930, was composed as follows: Premier and Minister of Interior, André Liaptcheff; Foreign Affairs, Athanase Buroff; Education, Alex. Tsankoff; Justice, Kantocho Milanoff; Commerce, Dimitri Michalkoff; Finance, Vladimir Molloff; Public Works, Gheorgi J. Danailoff; Posts and Railways, Petko Stainoff; Agriculture, Grigor Vasileff; War, General Kissioff (Jan. 31, 1931).

### HISTORY

**LIAPTCHEFF CABINET FALLS.** After dominating Bulgaria for eight years, the government bloc of conservative middle-class elements and intellectuals known as the Democratic Entente met overwhelming defeat in national elections held June 21, 1931. The Democratic Entente, led at first by Premier Tsankoff and afterward by Premier Liaptcheff, obtained control when the agrarian Premier Stambulisky was overthrown by the *coup d'état* of June, 1923. Stambulisky

and many of his followers were murdered. The grinding poverty of the Bulgarian peasantry resulting from the collapse of farm prices during the world economic depression added to the unpopularity of the Liaptcheff government and the Opposition parties made decided gains in the local elections of Nov. 9, 1930.

Impressed by the evidences of widespread discontent during a tour of rural districts in March, 1931, King Boris, upon the dissolution of the *Sobranie* April 18, secured Premier Liaptcheff's resignation. Apparently the King hoped to check the growing class division between the peasantry and the government bloc by introducing new elements into the Cabinet. He called upon Alexander Malinoff, leader of the oppositional Democratic party, to form a new Cabinet. Malinoff, however, was unable to secure the necessary coöperation of the Democratic Entente and accordingly the King was obliged to reinstate Liaptcheff. In the subsequent election, the government coalition's representation was reduced to 79, while the Opposition bloc, headed by M. Malinoff, won 150 seats. The Communists showed considerable strength, winning 32 mandates; the Macedonian group won eight seats, and the Socialists five. For the previous standing of the parties, see *Government*.

A new Ministry, formed June 29, was headed by Alexander Malinoff as Premier and Foreign Minister. Other members were: Interior, N. Mushanoff (Democrat); Education, K. Mouravieff (Agrarian); Finance, Dr. A. Gherghinoff (Democrat); Justice, D. Varbenoff (Liberal); Public Works and Communications, G. Iordanoff (Agrarian); Rails, Posts and Telegraphs, St. Kostowekoff (Radical); Agriculture and State Domains, D. Guitcheff (Agrarian); War, Gen. A. Kissioff; Trade, Gherghi Petroff (Liberal). The Malinoff Cabinet was more progressive than its predecessor, but not sufficiently radical to satisfy its Agrarian supporters. Communist demonstrations marked the opening of the new *Sobranie* August 20 and the Bolshevik propaganda which raged throughout the country following the elections caused the police on September 7 to ban all public meetings. In several villages, the police fired upon crowds resisting the order and many arrests were made.

The Malinoff Cabinet's foreign policy was conciliatory in general, but a violent quarrel ensued with Greece as a consequence of the Hoover reparation and war-debt moratorium (see *REPARATIONS AND WAR DEBTS*). When Bulgaria suspended her reparation payments to Greece the latter country suspended payments on the Greek government's debt of \$500,000 to Bulgaria. The debt agreement had been made in compensation for the confiscation of the property of Macedonian fugitives who fled to Bulgaria from territory acquired by Greece after the World War. The Bulgarian government contended that the debt was not a war debt and was therefore not included in the moratorium agreement. In September, the quarrel was heard by the Council of the League of Nations. See *GREECE* under *History*.

Premier Malinoff resigned with his entire Cabinet on October 12, pleading ill health, and a new Ministry was constituted with N. Mushanoff, the former Minister of the Interior, as Premier and Foreign Minister. The Interior portfolio went to Dr. Gherghinoff, the former Finance Minister, while the latter post was filled by M. Stafenoff, a prominent banker and industrialist.

The other Cabinet posts were filled as before and there was no change in party representation. In December Premier Mushanoff visited Ankara to discuss political and economic conditions with the Turkish leaders. An official statement of December 8 announced that a Bulgarian-Turkish commission had been established to regulate the economic problems of the two countries. Bulgarian representatives attended the second Balkan Conference held in Istanbul early in November (see *TURKEY under History*). Demonstrations before the French and Yugoslav legations in Sofia and fist-fighting between the government and Communist members in Parliament marked the anniversary of the Treaty of Neuilly (November 27). The feud between the rival Macedonian revolutionary groups continued its savage course. On August 15, Christoff Todoroff, head of the Protogeroffist faction, and several associates, were mutilated by the explosion of a bomb received by mail, presumably from members of the Mihailoffist faction. The European financial crisis had the same repercussions in Bulgaria as in the other states of southeastern Europe and on October 9 the government restricted foreign exchange operations to the National Bank or to institutions designated by it. An agrarian conference held at Sofia, commencing Dec. 10, 1931, was attended by representatives of the Bulgarian, Yugoslav, Rumanian, Hungarian, Polish, and Czechoslovak governments. It represented a continuation of the negotiations inaugurated among the states of Central and Southeastern Europe in 1930 in an effort to find a way out of the agricultural depression.

Consult Leo Pasvolksky, *Bulgaria's Economic Position* (Brookings Institution, Washington, 1930).

**BURGESS, JOHN WILLIAM.** An American educator died in Brookline, Mass., Jan. 13, 1931. He was born in Giles Co., Tenn., Aug. 26, 1844. While he was a student at Cumberland University, the Civil War broke out, and he served with the Union Army during 1862-64. He then matriculated at Amherst College, from which he was graduated in 1867, and two years later was admitted to the Massachusetts bar. He did not practice, however, because in the same year he was called to Knox College as professor of English literature and political economy. He subsequently devoted two years to study in Göttingen, Leipzig, and Berlin, and upon his return (1873) became professor of history and political science at Amherst. In 1876 he accepted a similar position in Columbia College. Later his title was changed to professor of political science and constitutional law, and in 1890 he became dean of the school of political science, retiring as dean emeritus in 1912.

In 1906-07 he lectured at the Friedrich Wilhelm University, Berlin, as the first occupant of the Roosevelt chair of American history and institutions, established by James Speyer. In 1914-15 he was visiting American professor in Austrian universities. The Order of the Prussian Crown was conferred on him by the German Emperor and the Order of the Albrechts by the King of Saxony in 1907. He was the author of *Political Science and Comparative Constitutional Law* (2 vols., 1890); *The Middle Period of United States History* (1897); *The Civil War and the Constitution* (2 vols., 1901); *Reconstruction and the Constitution* (1902); *Causes of the European Conflict* (1914); *The Euro-*

*pean War of 1914* (1915; popular edition, 1916); *America's Relations to the Great War* (1916); *Militarism and the Emperor* (1916); *The Russian Revolution and the Soviet Constitution* (1919); *The Transformation of the Constitutional Law of the United States between 1898 and 1920* (1921); *Recent Changes in American Constitutional Theory* (1923); and *The Sanctity of Law—Wherein Does It Consist?* (1927).

**BURIAT-MONGOL REPUBLIC.** See *SIBERIA under Eastern Siberian Area*.

**BURMA.** The largest and most easterly Province of British India, Burma has an area of 262,732 square miles, or approximately the size of Texas. The Province is divided into Burma proper, 184,102 square miles; the Shan States, 62,305 square miles; and 16,325 square miles of unadministered territory. Capital, Rangoon.

The population at the census of 1921 totaled 13,212,192. Burmans are of the Mongoloid race group and are overwhelmingly Buddhist; they have little in common with the people of India proper in language, race, or religion. Rangoon, with 345,505 inhabitants, and Mandalay, with 148,917, are the leading cities. Burma boasts a much higher percentage of literacy than the other Indian Provinces. In 1928-29 there were 503,564 pupils in 7282 recognized schools and colleges, and 201,614 pupils in unrecognized institutions. There is a university at Rangoon and an intermediate college at Mandalay.

**PRODUCTION.** Agriculture is the principal occupation, supporting 9,159,000 out of the total population. Four-fifths of the total cultivated area of some 17,000,000 acres is under rice, which is the chief money crop of the people, forming 83 per cent of the exports by value in 1930. The decline in the price of unmilled rice from 160 rupees (1 rupee equals about \$0.365) per 100 baskets in 1930 to 65 rupees per 100 baskets in July, 1931, greatly reduced the purchasing power of the people and trade and industry was drastically restricted. There are about 20,000,000 acres of forest land, which yield approximately 1,000,000 tons of timber annually, half of it teak. In 1929 the teak output was 478,518 tons; other woods, 570,173 tons. Petroleum production in 1929 totaled 253,000,000 Imperial gallons (202,187,263 gallons in 1928). Tin, tungsten, silver, lead, zinc, and wolfram are mined. Factories in 1930 numbered 948, principally rice mills and sawmills, and employed nearly 100,000 persons.

**COMMERCE.** For the fiscal year ended Mar. 31, 1931, imports of foreign merchandise (excluding the coastal trade with India proper) declined to the equivalent of \$50,185,097 from \$76,160,268 in the previous fiscal year. Exports declined in value to \$117,434,064 from \$143,819,793 in 1929-30. The United States in 1930-31 supplied \$5,470,620 of imports (\$6,748,850 in 1929-30) and purchased \$1,634,470 of exports (\$1,953,115). In the fiscal year 1931-32, trade showed even more drastic declines. Rice is the leading export and cotton piece goods the chief import.

**FINANCE.** For the fiscal year 1929-30, revised estimates for revenue were 1045 lakhs of rupees (about \$38,142,500) and for expenditures 1122 lakhs (about \$40,953,000). Burma made no contribution to the Central Government of India in 1929-30.

**COMMUNICATIONS.** Due to the rugged northern and eastern frontiers, communication with India

and the outside world is entirely by water. About 98 per cent of Burma's imports and 85 per cent of its exports pass through Rangoon, situated 20 miles from the sea on the Rangoon River. In 1930-31, a total of 1811 steamers of 4,419,000 net tons entered the port, unloading 1,551,329 tons of goods and loading 3,077,542 tons of Burmese products. The Irrawaddy River is navigable for 900 miles and forms the main highway of commerce, although there are 2046 miles of state-owned railway lines. Surfaced highways extended 1576 miles; unsurfaced, 7860 miles.

**GOVERNMENT.** In 1923, Burma was constituted a Governor's Province under the Government of India Act of 1919. There is an appointive executive council and a legislative assembly of 103 members, of whom 80 are elected and 23 nominated and *ex-officio*. The Shan States are administered by the local chiefs under supervision of the Commissioner of the Federated Shan States. Governor in 1931, Sir Charles Alexander Innes, appointed in 1927.

**HISTORY.** The revolt in Burma, which broke out in Lower Burma late in 1930, assumed formidable proportions during 1931. Despite active measures by the British authorities, the uprising spread from district to district and from Lower into Upper Burma. The seriousness of the situation and the difficulties encountered in attempting to stamp out the revolt were described by the Secretary of State for India before the House of Commons on May 17, 1931. American missionaries from Burma, arriving at Simla, India, on May 21, reported that no foreigners were safe in the interior. They placed the casualties to natives in clashes with British troops at 500 killed and thousands wounded or captured.

Early in June, the Burmese government opened a large-scale offensive against the rebels, with 8000 British and British-Indian troops and an augmented native police force. Serious reverses were inflicted upon the rebel forces and a number of their leaders were captured, including Saya San, also known as "King Golden Crow." Saya San and 18 of his lieutenants were sentenced to death by a special tribunal at Rangoon on August 28. Eighteen other ringleaders received life terms. By the beginning of September, Sir Charles Innes was able to report to the Legislative Council that the situation was steadily improving. The surrender of other rebel leaders was reported in December.

The revolt appeared to be both nationalistic and economic in origin. It aimed at the expulsion not only of the British but also of the Indian coolies, who were imported in large numbers to work at lower wages than the Burmans, and of the Chinese, who monopolized much of the trade of the country. Of the 642,478 passengers who arrived and departed from Rangoon during 1930, the large majority were Indian coolie laborers arriving to take up employment or returning to India after completing a contract. The collapse of rice prices in 1930 and 1931 added to the suffering imposed through the lowering of the standard of living by Indian coolie competition. Burman resentment flamed out in bloody riots and attacks upon Indians, large numbers of whom were reported to be fleeing the country.

In the country districts the nucleus of the revolt was furnished by armed dacoit (robber) bands, who had maintained a guerrilla warfare

ever since the annexation of the country by Britain. From their jungle fastnesses, rebel bands launched night attacks upon native villages, murdering and looting those who failed to join actively in the revolt. In the towns, the Burmese organized boycotts of British goods and campaigns of civil disobedience on the Indian model. The use of alcohol, and tobacco, and the wearing of European dress were forbidden. Knifing of those refusing to obey boycott rules was common.

**THE ROUND-TABLE CONFERENCE.** Irritation of the Burmans at their relationship with the Government of India was declared by observers to be an indirect cause of much unrest. The Simon Report of 1930 had urged an "immediate and public declaration" of the separation of India and Burma, and the British Parliament early in 1931 "conceded the principle" of separation. Meanwhile in India there had developed a campaign of opposition to the separation plan, which further aroused Burmese anger. The three Burmese political parties differed in their programmes, however. The Nationalist People's party favored immediate separation followed by eventual dominion status within the British Empire. The Home Rule party demanded immediate dominion status, failing which it preferred to enter an Indian federation with the aim of cutting adrift later. The third and least important party, the General Council of Burmese Associations, stood for immediate independence.

In an effort to eliminate this source of unrest, the British government on August 20 summoned a round-table conference of Burmese and British representatives to discuss a constitution for a separate Burma and the future relations of Burma with India. The conference assembled in London November 27, previous to the termination of the Indian round-table conference, and was still in session at the end of the year.

**BUSINESS REVIEW.** Although the outlook at the beginning of the period was by many deemed hopeful; and optimistic interviews were made public by not a few supposed authorities, the year 1931 at no time seemed able to warrant the forecasts thus presented. It is true that during the first few months of the year, there was a temporary upswing in certain classes of manufacturing which gave a false appearance of activity. The cotton, and to some extent the woolen, textile, and shoe manufacturing plants as well as industries generally which were producers of consumable commodities were fairly occupied, though not under very remunerative conditions. Employment increased up to mid-year, and there was a good deal of belief that the better situation might be transferred to the staple industries. At one time, it seemed likely that steel and iron manufacturing would move steadily ahead, but this expectation soon disappeared.

When the moratorium with Germany and with the Allied nations was announced at the beginning of July, 1931, it gave a shock to all banking and finance and tended to curtail the extension of credit by the larger banks. From that time onward, contraction set in and was vigorously pressed forward. The outcome was witnessed in a general shrinkage of bank credit, especially toward the end of the year, and a repression of industrial activity as a consequence. Along with these conditions, there was a distinct tendency to deterioration in most shipping and

selling lines, while export trade in particular tended to show sharp recession, with resultant reduction of demand for labor and material in all branches of business in which export demand was a large factor. This again reacted unfavorably upon home trade; and freights, as measured by car loadings, showed marked recession. The close of the year left business, statistically measured, at practically low point as may be seen from the accompanying table.

DISTRIBUTION. Notwithstanding the low condition of activity in manufacturing and industry, it was true in 1931, as in preceding years, that the distribution of goods continued fairly satisfactory throughout the year, thus indicating the existence of a large volume of purchasing power in the hands of consumers un-

\* Based throughout on figures of daily average sales— with allowance or changes from month to month in number of Saturdays and for six national holidays: New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas. Adjustment for seasonal variation makes allowance in March and April for the effects upon sales of changes in the date of Easter.

touched by the depression. The situation was fairly well indicated by the movement of transactions at department stores throughout the country, which, as reported to the Federal Reserve Board, was as noted in table on preceding column.

Chain store earnings and volume likewise held up very well, especially during the forepart of the year, and served as a valuable "backlog," even during the depressed later months of the period. Employment, which had been unsatisfactory in 1930, fell off after spring work was over, and the later months of 1931 showed substantial recessions. Some had estimated toward the close of the period that at least 6,000,000 persons were unemployed. It should be noted, however, that no statistical basis of reliable character exists for the making of such estimates. See UNEMPLOYMENT.

COMMODITY PRICES. There had been severe shrinkage of commodity prices during the latter part of 1930, but the real reduction of the price level was still to come. Early in 1931 there were sharp shrinkages of basic materials, those particularly evident being in cereals, copper and non-ferrous metals, rubber, and many other raw commodities. These items were the same that had shown greatest susceptibility to reduction during the preceding year. There was now added, however, a distinct tendency toward reduction of retail prices and an effort in various lines to bring about some readjustment of values that would force wholesale and retail prices closer together. These revisions at no time during the year effected a reduction of living costs that was at all comparable with that already brought about in wholesale values, and accordingly the decrease of employment and the suspension of dividends resulted in more than normal suffering, because not accompanied by corresponding lowering of outlays. Not a few observers, who rightly attributed general inconvenience and even suffering to the fall in prices, failed to recognize that the real trouble lay in the unevenness of the fall and were accordingly led to urge the use of inflation of credit as a means of raising goods on the lower levels instead of attempting to readjust living costs downward. The accompanying table shows the movement of wholesale prices.

MANUFACTURING. The effort to keep up working staffs and to maintain wages and outlay on capital restoration so strongly urged by President Hoover at the beginning of 1930 had been generally abandoned by the close of the year, and the opening of 1931 witnessed a general breaking away from the philosophy which had been responsible for these plans. Manufacturers began to institute rigid economies, and by the middle of the year reductions of 10 to 20 per cent had been instituted in many plants including not

only employees but the higher officers of the concerns. During the early autumn United States Steel and other large enterprises adopted a like policy, and their decision was copied by many others. The result was a general reduction of the wage level. Railroads almost alone stood out against the reduction, and even they sought to put it into effect in part at least by reducing staffs and increasing assignments to the retained workers where possible. By the end of the year a well-defined attempt on the part of the roads, to get a 10 per cent reduction of wages either through voluntary agreement on the part of the men, or through an appeal to labor boards (State and national) was in full swing. Meanwhile output had been reduced, and attempt made in most lines to get rid of all accumulated stock and to produce only upon actual orders. This, in many instances, made goods stocks unusually short. Generally speaking, the relative volume of wage payments in manufacturing industries was shown to be about 12 to 15 per cent below that of 1930.

The following table shows the unfilled tonnage of the Steel Corporation at the end of each month since the close of 1927, usually taken as a good indicator of conditions and prospects in "basic" and "staple" business.

December ..	2,850,000	3,943,596	4,417,193	3,976,712

**AGRICULTURE.** The year on the whole proved exceptionally favorable in agriculture. Drought, which had been so destructive over large parts of the country during the previous year, was absent, except in limited sections, largely in the Middle Northwestern States. Both cotton and wheat turned out large normal crops, cotton amounting to 16,918,000 bales and wheat (spring and winter) to about 892,271,000 bushels. However, the low prices prevailing not only for grain, but for almost all agricultural products proved the source of utmost suffering and discontent among farmers, and led to radical utterances with respect to financial and other alleged remedies. There was no relief during the year, and the efforts of the Farm Board, largely devoted to speculation in wheat and cotton, seemed to have no particular result, or if any was traceable to them, it was in the direction of depressing prices. Although many schemes for agricultural relief made their appearance in the public prints, it was not until the reassembling of Congress in December that most of them became articulate. They then took form as plans for the rehabilitation of the Federal Land Banks which had fallen into bad condition, and occasionally as proposals for assisting farmers in re-seeding and other essential operations of various sorts. The agricultural situation so far as output in the United States goes is reviewed in the table on page 133.

**GENERAL BUSINESS.** General business throughout the year was naturally greatly depressed. In financial fields, the extent of depression and failure was greatest. About 2200 banks closed their doors during the year, while the list of commercial failures (see table, page 132.) was heavy. Retirements from financial business of every kind were numerous, particularly on the stock exchanges of the country. Year-end statements showed a remarkable recession of corporate earnings, probably averaging about 30 per cent below 1930. Declines in many cases brought about deficits and dividend suspensions were unprecedented in number. Only about 125 listed firms (New York Stock Exchange) were able to keep up dividend distributions on the same plane as formerly. Among these, however, were not a few who paid dividends out of accumulated surplus, not wishing to interrupt their records for payment. Railroads, in a large number of cases, cut or suspended their payments to stockholders, and the volume of bonds in default was greater than for many years. (See RAILWAYS.) Enterprises which did not suffer so severely as others or in some cases showed actual improvement were found sporadically in some luxury trades, in tobacco production, in some automobile specialties, and in a few businesses which, for special reasons, enjoyed a partial or total monopoly of the field. On the whole, the condition of trade, and the profits earned, were less satisfactory than at any period for fully 40 years, current comparisons usually going back to the conditions attendant on the panic of 1893, though some were inclined to refer back to that of 1873 for a parallel.

**BUSINESS FAILURES.** In the table on page 132 the failure situation as reflecting the entire business field is depicted, following *Bradstreet's* figures which show a record total of over 26,000 of all kinds. The table indicates the wide distribution of the embarrassments and difficulties which resulted from the conditions already described. In general, failures were due to three major causes—the continuous losses in inventory, due to the reduction of prices; the inability to collect receivables, resulting from unemployment of customers and other difficult conditions; and the failure to keep up sales causing closings on account of excessive "overhead." Difficulties were extraordinarily widespread, affecting many enterprises which had previously supposed themselves immune to ordinary business disturbance.

**CAINE, SIR (THOMAS HENRY) HALL.** A British novelist and dramatist, died at Greeba Castle

on the Isle of Man, Aug. 31, 1931. He was born in Runcorn, Cheshire, May 14, 1853, and attended schools on the Isle of Man and in Liverpool. He was trained to be an architect, but instead of practicing became a journalist, serving for six years as editorial writer on the Liverpool *Mercury*. During 1881-82, the last two years of Dante Gabriel Rossetti's life, he lived with him in London, and on his death published *Recollections of Rossetti*. He also wrote during this period for the *Athenæum*, *Academy*, and other magazines and published *Life of Coleridge* (1883) and *Cobwebs of Criticism* (1883). In 1895 he visited Canada as a representative of the Authors' Society and the British Colonial Office to promote the international copyright movement and negotiate terms with the Dominion Government regarding the Canadian copyright.

His early novels, marked for the most part by a strong religious or moral interest and dealing with Manx characters and subjects, include *The Shadow of a Crime* (1885); *The Son of Hagar* (1886); *The Deemster* (1887); *The Bondman* (1890); *The Scapergoat* (1891); *The Manaman* (1894); *The Christian* (1897); *The Eternal City* (1901); *The Prodigal Son* (1904); *The White Prophet* (1909); and *The Woman Thou Gavest Me* (1913). Of these, *The Deemster*, *The Manaman*, *The Christian*, *The Eternal City*, *The Prodigal Son*, and *The White Prophet* were dramatized, but the latter, because it placed the British Army in an unenviable light, came under the ban of the English censor. Among his later plays are *The Iron Hand* (1916) and *The Prime Minister* (1918). Many of his novels were filmed, both in the United States and in England, and a collected edition of his works was issued in 1921. During the World War he was concerned with British propaganda in the United States, his articles appearing in an American syndicate, and he also published *The Drama of 365 Days, Scenes in the Great War* (1915) and *Britain's Daughters* (1916). As a tribute to the Belgian king and people, he edited *King Albert's Book* (1914-15), for which he was made an Officer of the Order of Leopold. He also was created a Knight of the British Empire (1918) and a Companion of Honor (1922). His later works include *The Master of Man* (1921); *The Woman of Knockaloe* (1923); and *The Life of Christ* (posthumous, 1931).

**CAISSON CONSTRUCTION.** See **FOUNDATIONS**.

**CALIFORNIA. POPULATION.** According to the Fifteenth Census, the population of the State on Apr. 1, 1930, was 5,677,251, as against 3,426,861 for 1920. Its composition in 1930 was, as to origin: native white, 4,230,213, as against 2,583,049 for 1920; foreign-born, white, 810,034 (excluding Mexicans); Mexican, 368,013; Negro, 81,048; Japanese, 97,456; Chinese, 37,361; Indian, 19,212; Filipino, 30,470. There were also small numbers of other Asiatic or Pacific groups. The number of persons in gainful occupations was 2,500,969. Of these, 334,241 were in agriculture, including 120,399 farmers and their farm laborers. Manufacturing and mechanical industries claimed 618,023; mineral extraction, 55,623; transportation, 246,616; trade, 535,061; professions, 251,834; domestic work, 289,787. Among the cities, Los Angeles led in population, with 1,238,048 (1930); 576,673 (1920). San Francisco had 635,394 (1930); 506,676 (1920). Oak-

land, 284,063 (1930); 216,261 (1920). San Diego, 147,995 (1930); 74,683 (1920). Sacramento, the capital, had 93,750 (1930); 65,908 (1920).

**AGRICULTURE.** The following table gives the acreage, production, and value of the principal crops in 1931 and 1930:

Crop	Year	Acreage	Prod. Bu.	Value
Oranges ...	1931 .....	34,900,000*	\$55,840,000	
	1930 .....	35,000,000*	52,500,000

**MINERAL PRODUCTION.** The production of petroleum, which had constituted more than half of the value of the State's mineral total year by year, fell off somewhat sharply to 228,099,000 barrels for 1930, from 292,534,000 for 1929; in value, it was \$251,000,000 (estimated) for 1930 and \$321,367,000 for 1929. The increasingly valuable production of natural gas (totals not available for 1930) amounted to 342,214,000 M cubic feet, in value \$68,972,000 for 1929 (for 1928, 246,215,000 M cubic feet valued at \$56,695,000). There were made from natural gas, in 1930, 814,100,000, gallons of natural-gas gasoline; in 1929, 840,325,000. These quantities were valued at \$57,000,000 (estimated) for 1930 and \$67,009,000 for 1929. The State's clay products came to \$22,733,974 for 1929, as against \$20,993,347 for 1928. Cement mills shipped 10,438,479 barrels of Portland cement in 1930, and 12,064,746 in 1929; this product was valued at \$15,241,089 for 1930 and \$22,805,576 for 1929. Stone production, while of low average grade, attained for 1929, 11,818,300 short tons and a value of \$10,861,539.

Though gold no longer ranked among the State's foremost mineral products, California held the lead as a domestic producer of gold. The quantity produced rose to 450,289 fine ounces for 1930, from 409,020 for 1929; and the value of the product to \$9,308,300 (1930), from \$8,455,200 (1929). There were produced also 1,434,126 ounces of silver in 1930; in 1929, 1,194,651; the value, \$552,139 for 1930, however, was lower than the \$636,749 of 1929. Copper production fell to 20,262,447 pounds (1930), from 33,084,232 for 1929, when its value was \$5,846,543. Borates, salt, sodium salts, and mercury each yielded more than \$1,000,000 in 1929. The total value of the State's mineral products was \$554,916,020 for 1929; for 1928, \$434,261,175.

The total value of the gold, silver, copper, and lead produced from placer and lode mining in California in 1931 was estimated at \$12,192,700,

pared with 1930. Gold and lead showed increases in output compared with 1930, but silver and copper declined in yield, owing to the drop in price of the metals and the consequent curtailment of production. No recovery of zinc was reported in 1931. The value of the gold recovered from lode and placer mining in California in 1931 was estimated at \$10,708,000 (518,000 fine ounces), compared with \$9,451,162 (457,200 fine ounces) in 1930. Silver output from mines in California in 1931 was estimated at 836,000 fine ounces, valued at about \$242,440, compared with 1,622,803 ounces, valued at \$624,779, in 1930. Silver ore mined in the State yielded approximately 18 per cent of the total silver produced in the United States in 1931, but the output from this source was 20 per cent less than in 1930. The yield of copper from mines in California in 1931 was estimated at 13,250,000 pounds, valued at about \$1,099,750, a decrease of approximately 14,035,300 pounds in quantity and of about \$2,447,300 in value, compared with 1930. This large decrease was due to the closing of the Engels copper mine in Plumas County and the cessation of mining copper ore by the Mountain Copper Co. (Ltd.) at its property in Shasta County. The output of lead from mines in California in 1931 was estimated at 3,750,000 pounds, valued at about \$142,500, an increase of approximately 190,500 pounds in quantity and a decrease of about \$35,500 in value, compared with 1930.

**MANUFACTURES.** Federal Census data obtained in 1930 and covering 1929 gave the number of the State's manufacturing establishments as 12,003, or some 20 per cent more than for 1927. These employed in 1929, 290,702 wage earners, or 10.6 more than in 1927. The wages paid in 1929 totaled \$418,797,162. The materials used in manufacture in 1929 cost \$1,706,204,154; the fuel and purchased electricity, \$53,725,229. The manufactured product was valued at \$3,104,086,175, or about 20 per cent above that of 1927. The value added in the year 1929 by manufacture was calculated at \$1,344,156,792. Los Angeles held first rank in manufacturing, having in 1929, 3438 establishments employing 74,593 wage earners, who received \$108,026,221 in wages, while the manufactured product of the year totaled \$745,100,403. San Francisco, with 2521 establishments, 45,098 wage earners, wage payments of \$66,461,917 and a manufactured product of \$475,618,387, came next.

**FINANCE.** Total revenue receipts for the fiscal year ended June 30, 1930, were \$115,178,669 and total expenditures, including interest and capital outlays, \$116,634,642. Expenditures included \$32,974,905 for highways (new construction, \$25,226,972), \$27,117,115 for education, \$34,078,212 for permanent public service improvements, and \$5,669,114 for interest on debt. The funded debt outstanding June 30, 1930, was \$123,580,844, of which \$61,175,000 was for highways.

**TRANSPORTATION.** The total number of miles of railroad line in operation on Jan. 1, 1931, was 8240. Additions to the mileage of line in the year preceding had totaled 12.47 miles, and abandonments, 64.64. In 1931 were built 178.21 miles of new first track, 0.67 mile of third track and 0.68 of fourth track.

**EDUCATION.** The number of persons reported as the registered school population of October, 1930, was 1,383,650. There were enrolled, however, in the public schools of the State, during

1,455,995. Of those enrolled, 783,497 were in elementary grades and 564,020 in high-school grades. The total expenditure of the academic year for public school education (kindergarten, elementary school, high school, and junior college included) was \$153,168,453. According to report in the *Journal of the National Education Association*, the Legislature of 1931, by empowering elementary school districts to impose a tax up to a yearly 70 cents ad valorem for the benefit of a special building fund, made it possible for local school systems to take care of their building needs in many cases without resort to bond issues.

**CHARITIES AND CORRECTIONS.** The State Department of Social Welfare was consolidated from previous boards and was made a major State department in 1927. Director in 1931 Mrs. Rheba Crawford Splivalo. The activities of the State Department of Social Welfare, include the inspection and supervision of County Hospitals, charitable, correctional and penal institutions of the State, and licensing of institutions for children and for aged. The Divisions of the Department are as follows: Aid to children, Aid to aged, Aid to blind, Adoptions and Probation. There were 16,000 children on aid in 1931—85 per cent with their mothers, 6 per cent in institutions, 9 per cent with relatives or in boarding homes. Under the Old Age Security Act Dec. 31, 1931, 9596 active cases were on aid. Under the Blind Act at the same date there were 1427 active cases. Among the chief State institutions are Agnew State Hospital, Agnew; Industrial Home for the Adult Blind, Oakland; Mendocino State Hospital, Talmadge; Napa State Hospital, Imola; Norwalk State Hospital, Norwalk; Patton State Hospital, Patton; Pacific Colony, Spadra; Sonoma State Home, Eldridge; Stockton State Hospital, Stockton; Ventura School of Girls, Ventura; Whittier State School, Whittier; Preston School of Industry, Ione; State Prisons at Folsom and San Quentin. The California Institution for Women at Tehachapi was to be open in April 1932.

**LEGISLATION.** The regular legislative session, extending over four months, ended on May 18. It failed conspicuously to dispose of a number of the State's foremost legislative problems. Among these were the need of a more ample water supply in parts of the State, particularly the southern San Joaquin district, and the demand for the improvement of the revenue laws. Governor Rolph held to an announcement made at the outset of his administration that he would not put executive pressure on the legislators to carry out any given programme of bills. This policy of abstention was in consonance with the idea of distinct and separate legislative and executive functions, but it found the legislators facing a new departure and lacking any definite plan and leadership of their own.

California having acquired nine additional seats in the House of Representatives through the Federal reapportionment of 1930, extensive and in some cases radical changes were made in a redistricting measure which occupied the chief attention of the Legislature for the greater part of the session. The total of appropriations made for the ensuing two years was estimated to exceed the expected revenue for the period and as likely to reduce by \$15,000,000 the surplus of \$30,000,000 existing in the State Treasury. The act for the redistricting of the State's representation in Congress was a subject of especial conflict. Under the new Federal apportionment

California had 20 seats in the House of Representatives, a gain of 9. The rivalry between the northern and southern halves of the State shaped the outcome. Eleven districts were fashioned out of the southern area, south of the Tehachapi ridge, and 9 only were granted to the northern part. San Francisco suffered particularly, obtaining only 2 Representatives, whereas her advocates asserted the city to be fully entitled to 3 on the strict basis of population. The assertion was made that the redistricting law had been made in repudiation of an agreement entered into by political leaders in the previous autumn, according to which each half of the State was to have had 10 Representatives. The South deemed that this arrangement would, if carried out, have been unduly unfavorable to it, as the Census gave it somewhat the greater population. The North on the other hand felt itself entitled on the population basis to more than 9 seats.

**POLITICAL AND OTHER EVENTS.** The State's system of judicial procedure was criticized in a report issued on July 15 by the Federal Wickersham Commission, dealing with weakness in the State's laws. It was asserted that the State had given its courts no power to issue a writ of *coram nobis* in cases such as that of the Mooney appeal, where it was alleged that matter not appearing in the record justified a new trial. The progress of a company known as Fruit Industries Limited, dealing in products of the grape usable for the production of fermented beverage, and serving as an outlet medium for a part of the State's grape crop, attracted wide attention. As the company was connected with the California Grape Control Board and thus in relations with the Federal Farm Board it sought and received loans of over \$2,000,000 from that source. But at the same time shops in other States, selling its goods, were raided by the Federal Prohibition Enforcement personnel.

The company finally in November, discontinued home distribution. The State Supreme Court rendered in May a decision upholding the California Toll Bridge Authority as a valid body and its issue of \$75,000,000 of revenue bonds for financing the San Francisco Bay bridge project as legal. San Francisco adopted at an election on March 26 a new city charter giving increased power to the Mayor. The charter was to become operative in January of 1932. Government by city manager went into effect in Oakland on July 1, with Ossian Carr as city manager. The City Council of Los Angeles voted on March 9 to restrict the height of buildings by ordinance to 150 feet.

**OFFICERS.** Governor, James Rolph, Jr.; Lieutenant-Governor, Frank F. Merriam; Secretary of State, Frank C. Jordan; Treasurer, Charles G. Johnson; Comptroller, Ray L. Riley; Attorney-General, U. S. Webb; Adjutant-General, Seth E. Howard; Superintendent of Public Instruction, Vierling Kersey; Director of the Department of Agriculture, Dudley Moulton.

**JUDICIARY.** Supreme Court: Chief Justice, William H. Waste; Associate Justices, William H. Langdon, John W. Preston, Jesse W. Curtis, Emmet Seawell, John E. Richards, John W. Shenk.

**CALIFORNIA, UNIVERSITY OF.** A coeducational institution of higher learning with headquarters in Berkeley, Calif., founded in 1868. Branches are found in various parts of the State;

University of California at Los Angeles, with the colleges of letters and science, and education; branch of the college of agriculture in Davis; citrus experiment station and graduate school of subtropical horticulture in Riverside; Scripps Institution of Oceanography, near La Jolla; Lick Observatory on Mount Hamilton; and agricultural stations at Kearney Vineyard, near Fresno, near San Jose, and in the Imperial Valley. The number of full-time resident students in courses leading to degrees on Nov. 1, 1931, was 18,342, of whom 9755 were men and 8587 were women. The enrollment in the university extension division in 1930-31 was 37,446 in classes and correspondence courses. The 1931 summer session enrollment totaled 7294. At the beginning of the autumn term there were approximately 2000 members on the regular teaching staff and 800 on the extension staffs. The endowment funds for 1930-31 amounted to \$16,696,497. The total income for the year was \$16,112,226. Total assets are listed at \$63,534,582, improvements and equipment at \$40,614,099. The libraries contained approximately 1,200,000 bound volumes.

During the year 1931 there were completed on the Berkeley campus three new buildings for the college of engineering group, at an approximate cost of \$685,000. Eshleman Hall, a building to house student publication activities, was completed at a cost of \$250,000. On the 13 acres of land acquired southwest of the campus for recreational purposes, a track and track stadium were under construction at a cost of \$250,000; baseball bleachers, to cost \$35,000, were being built; and a new \$1,000,000 gymnasium for men was completed. At San Francisco \$600,000 was being spent for a building to house the outpatient department of the university hospital at the medical school. At Los Angeles, Kerckhoff Hall, a student union building costing \$800,000, a mechanics arts building costing \$100,000, and a subtropical horticulture building to cost \$20,000 were completed; a gymnasium for men and a gymnasium for women, at a total cost of approximately \$1,000,000, and a new wing of the physico-biology building, to cost \$300,000, were under construction. Mira Hershey Hall, a dormitory for women, was completed at a cost of \$300,000. At Scripps Institution of Oceanography, a new laboratory building, costing \$120,000, was completed. At Riverside, an insectary was built at a cost of \$25,000, and an entomology building, to cost \$150,000, was under construction. Robert Gordon Sproul, B.S., LL.D., was president of the University of California; Monroe E. Deutsch, A.B., LL.B., M.A., Ph.D., vice president and provost; Ernest Carroll Moore, A.B., LL.B., M.A., Ph.D., vice president and provost of the University of California at Los Angeles.

**CALIFORNIA INSTITUTE OF TECHNOLOGY.** An institution for collegiate and graduate instruction and research in the pure and applied sciences in Pasadena, Calif., founded as Throop Polytechnic Institute in 1891. The enrollment in 1931, was 751, of whom 531 were in the undergraduate and 220 in the graduate school, the faculty numbered about 200. The endowment was approximately \$10,000,000, and the annual income \$800,000. There were 30,000 volumes in the library. During the year an astrophysical laboratory (part of a 200-inch telescope project), two geological laboratories and units of

the chemical and biological laboratories, and the W. K. Kellogg radiation laboratory for the study of high-potential X-rays were under construction. An outstanding development was the opening in September of a group of residence halls—Dabney, Ricketts, Blacker, and Fleming—accommodating some 300 undergraduate students, and the Athenaeum for graduate students. Among the visiting professors during 1931 were Albert Einstein, Jacob Gould Schurman, and Charles A. Beard. The institute has no president, the administration centering in an executive council of eight, of which Robert A. Millikan, Ph.D., LL.D., Sc.D., is chairman.

**CALIPHATE.** See **PALESTINE** under *History*.

**CAMBODIA**, kām-bō'dī-d. A French protectorate constituting one of the five component states of French Indo-China. Area, 67,800 square miles; population at the census of 1929, 2,611,349, of whom 2004 were Europeans (including military forces), and 156,277 Chinese. Phnôm-Penh, with a population of 83,079, is the capital and chief town. There were 133 French schools, with 11,252 pupils in 1930. The soil is fertile, but only a comparatively small area is under cultivation. The chief product is rice, its annual export amounting to about 250,000 tons. Other products include cotton, pepper, kapok, tobacco, rubber, silk, salt fish, hides, cattle, coffee, sugar, and iron. Imports in 1929 were valued at 64,665,000 francs (1 franc equals \$0.039), compared with 44,396,000 francs in 1928, while exports totaled 14,722,000 francs, against 19,995,000 francs in 1928. The budget for 1931 balanced at 11,434,020 piasters (the piaster was stabilized at \$0.392 on May 31, 1930), and included 728,000 piasters allowed for the civil list of the king and princes. A railway between Phnôm-Penh and Battambang was under construction in 1931. There were in the same year 1430 miles of hard-surfaced roads, 188 miles of dirt roads, and 50 miles of highway under construction. Executive authority is exercised by the French Resident-Superior, who acts through the native King. King in 1931, Sisowathmonivong (crowned July 22, 1928). Resident-Superior, F. Lavit. Cambodia is famous for its ruins of ancient civilizations, particularly those of Angkor. See **FRENCH INDO-CHINA**.

**CAMEROON**, kī'me-rōon, or **CAMEROONS**. The former German territory of Kamerun on the Gulf of Guinea, West Africa, bounded on the north by Nigeria and on the east and south by French Equatorial Africa and Spanish Guinea. Occupied by French and British troops in 1916, it was divided between the two nations in 1919 under mandates of the League of Nations.

**FRENCH CAMEROON.** France received an area of 166,489 square miles, in addition to 107,270 square miles ceded to Germany in 1911 and later incorporated in French Equatorial Africa. The population of the French portion in 1929 was estimated at 1,944,000, including 2009 Europeans. In 1929, there were 89 Government schools, with a total attendance of 7000, and 38 private schools, with 6748 pupils. Tobacco, almonds, palm oil, timber, rubber, cacao, and ivory are the chief products. Imports in 1929 totaled 193,618,213 francs (1 franc equals \$0.039) and exports 164,368,670 francs. The general budget for 1929 balanced at 63,041,485 francs; the special railway budget amounted to 21,766,000 francs. Highways extended 2406 miles and railroads,

292 miles. In 1929, 415 vessels entered Douala, the chief port. Yaoundé is the seat of administration. Commissioner in 1931, M. Marchand.

**BRITISH CAMEROONS.** The British portion, extending along the Nigerian frontier from the sea to Lake Chad, has an estimated area of 34,236 square miles and an estimated population of 700,050. Imports in 1929 were valued at £214,621; exports at £307,007. Government revenue (1928-29) amounted to £88,904; expenditure, £138,501. A total of 137 vessels of 265,738 tons entered the port of Victoria in 1929. British currency is in use. The Governor of Nigeria administers the territory. See NIGERIA.

**CAMP FIRE GIRLS OF AMERICA.** An organization primarily for the adolescent girl, whose purpose is to "seek beauty, give service, pursue knowledge, be trustworthy, hold on to health, glorify work, and be happy." It was organized nationally in March, 1911, and chartered in 1912, with Dr. Luther H. Gulick as president, but its foundations were laid some time before by a group who felt that the leisure time of young girls could and should be used to help them grow. A flexible programme of activities in seven fields, or crafts, and a system of awards, or honors, for accomplishment in these fields was outlined. A girl may win honors in any of the seven crafts: Home, health, hand, camp, nature lore, business, and citizenship. The purpose of these activities is not the attainment of particular skill, but the development, and happiness through development, of the individual girl who discovers new interests and new talents and at the same time enjoys the companionship of other girls. The programme also appeals to her æsthetic sense through its ritual and symbolism, based on Indian lore and handicraft, and upon joining she chooses a symbol which signifies her ambition or ideal.

Each year Camp Fire girls launch a special project. International friendship was the objective selected for 1931, and the girls, starting with their own family histories, developed an interest in the songs, stories, costumes, and folkways of many nations and carried out programmes demonstrating the interdependence of nations.

The membership of the organization in 1930 was 236,643, including 173,985 Camp Fire girls and guardians and 35,995 Blue Birds, the youngest members. During the school year of 1929-30 and the summer of 1930, 145 training courses were given, with an attendance of 2769 leaders. In order to reach more leaders a plan was worked out in the fall of 1930 for guardians' training institutes, to be held week-ends for concentrated study and consultation. During the summer of 1930, 23,099 Camp Fire girls attended 101 Class A camps (camps having an attendance of 25 or more), while thousands of others went camping in small groups with their leaders. The organization publishes *Everygirl's*, a monthly magazine for girls, and *The Guardian*, a programme resource for leaders.

The national Council, composed of delegates from local councils, is responsible for the management of the organization. The executive officers of the national board of directors, elected by the national council, have charge of special departments covering the activities of groups not under the council as well as those organized in council territory. At the meeting of the national

council held in Minneapolis, Minn., Sept. 13-21, 1931, Mrs. Lida Foote Tarr was elected president; Miss Florence Hughes, first vice president; Dr. Joseph E. Raycroft, second vice president; Dr. Jay B. Nash, third vice president; Dr. Myron T. Scudder, treasurer; Lester F. Scott, secretary and national executive. National headquarters are at 41 Union Square, New York City.

**CANADA.** A dominion of the British Commonwealth of Nations, bounded on the north by the Arctic Ocean, on the south by the United States, and on the east and west by the Atlantic and the Pacific oceans, respectively. Capital, Ottawa.

**AREA AND POPULATION.** The total land area of Canada, revised according to the Labrador Boundary Award of 1927, is estimated at 3,510,008 square miles. The water area is about 180,035 square miles. Canada consists of nine Provinces, each with its own parliament and administration, and two Territories, viz., the Northwest Territories and Yukon Territory, each under a commissioner, assisted by a council.

The accompanying table shows the areas of the provinces, etc., with the population at recent censuses.

AREA AND POPULATION OF CANADA

Province	Land area, sq. miles	1921	1931*
Prince Edward Island	2,184	88,615	88,040
Nova Scotia	21,068	523,837	512,027
New Brunswick	27,911	387,876	408,255
Quebec	583,895	2,361,199	2,869,793
Ontario	365,880	2,933,662	3,426,488
Manitoba	231,926	610,118	699,841
Saskatchewan	240,200	757,510	921,281
Alberta	250,925	588,454	727,487
British Columbia	353,416	524,582	689,210
Yukon Territory	206,427	4,157	4,213
Northwest Territory	1,258,217	7,988	7,133
Total	8,542,049	8,788,483	10,353,778

\* Preliminary figures subject to correction.

The principal cities, with the census populations of 1931 and 1921 (the 1921 figures in parentheses), are: Montreal, 810,925 (618,506); Toronto, 627,582 (521,893); Vancouver, 245,307 (163,220); Winnipeg, 217,587 (179,087); Hamilton, 154,914 (114,151); Quebec, 129,103 (95,193); Ottawa, 124,988 (107,843); Calgary, 83,362 (63,305); Edmonton, 78,829 (58,821); London, 71,022 (60,959); Windsor, 62,957 (38,591); Verdun, 60,378 (25,001); Halifax, 58,939 (58,372); Regina, 53,034 (34,432); St. John, 46,640 (47,166); Saskatoon, 43,025 (25,739); Victoria, 38,441 (38,727). The figures for 1931 are subject to revision.

In 1929, exclusive of the Territories, there were 234,915 births, 113,450 deaths, and 77,265 marriages. The rate of natural increase per 1000 of population was 12.4, as compared with 13.2 in 1928 and 15.8 in 1924. Canada's comparatively high birth rate of 24 per 1000 of population in 1929 was due largely to the influence of Quebec, which had a birth rate of 30.3 per 1000, as compared with 20.9 per 1000 in Ontario. In the other Provinces the rate varied from 17.4 per 1000 in British Columbia to 25.9 in Alberta. For vital statistics of the Provinces, see under separate article on each Province.

Immigrants into Canada during the fiscal year ended Mar. 31, 1931, totaled 88,223, as compared with 163,288 in the previous fiscal year. Im-

migrants from the United Kingdom numbered 27,584 in 1930-31 (64,082 in 1929-30); from the United States, 24,280 (30,727); and from other countries, 38,359 (68,479). Canadians returning to Canada from the United States during the 1930-31 fiscal year numbered 30,209, of whom 26,811 were Canadian-born, 2111 were British-born with Canadian domicile, and 1287 were naturalized Canadian citizens. In the fiscal year 1931-32 immigration declined even more drastically, due to restrictive regulations; for the first quarter immigrants numbered 10,188, as against 49,890 in the same period of 1930-31. In the calendar year 1930, 4205 persons were deported from Canada, of whom 2804 were returned to Great Britain and the remainder to foreign countries.

**EDUCATION.** Education is directly controlled by the respective Provinces (see separate article on each Province for statistics). During the academic year ending in 1929 there were 2,387,057 pupils in attendance at Canadian educational institutions, or 24.4 per cent of the estimated 1929 population. Pupils in ordinary day schools under provincial control numbered 2,080,949, the average daily attendance being about 1,647,871. There were 122,671 in vocational schools, 18,600 in private business colleges, and 74,238 in other private schools under college grade. The enrollment of regular students in universities was 28,870; in colleges, 9128; in classical colleges (mostly seminaries), 10,894. The expenditure on public schools in 1929 aggregated \$138,223,885, of which the Provincial Government contributed \$19,038,719 and local governmental units the remainder.

Higher education is carried on in 23 universities and 88 colleges, 50 of the colleges, most of them classical colleges or seminaries, being in the Province of Quebec. Of the universities, six (New Brunswick, Toronto, Manitoba, Saskatchewan, Alberta, and British Columbia) are state controlled; four (Dalhousie, McGill, Queens, and Western) are un denominational; and the remainder are denominational.

**AGRICULTURE.** Of the total land area of the nine Provinces (1,309,724,800 acres), approximately 358,162,190 acres are available for agricultural use and of this area only 140,887,903 acres were occupied in 1921. In 1930 the area under field crops was 62,214,670 acres and 9,889,513 acres were devoted to pasture; the value of field crops in the same year was \$631,592,900, as compared with \$958,981,400 in 1929 and \$1,125,003,000 in 1928. In 1929 the total estimated agricultural revenue was \$1,631,124,000, or 9.7 per cent less than the \$1,806,020,000 estimated for 1928. Of the 1929 total, field crops accounted for \$948,981,400; dairy products, \$291,743,000; farm animals, \$217,317,000; poultry and eggs, \$107,664,000; and fruits and vegetables, \$46,398,000.

The reduced farm income in 1929, 1930, and 1931 was due principally to the short wheat crop of 1929 followed by the drastic decline in wheat prices in 1930 and 1931. Although larger than in 1929, the 1930 wheat crop was valued at only \$173,589,000, compared with \$319,715,000 in 1929. Wheat is the principal money crop of Canada, which supplied about one-third of the world's wheat shipments during the year ended Mar. 31, 1931. Yields of the principal crops in 1929 and 1930, with comparative estimates for 1931, are set forth in the accompanying table.

CANADIAN CROP YIELDS, 1929, 1930, AND 1931  
[Units in thousands of bushels, except as indicated]

	1929	1930	1931*
Wheat .....	304,520	397,872	304,144
Oats .....	282,888	423,148	328,278
Barley .....	102,313	185,160	67,888
Rye .....	13,160	22,018	5,822
Flax seed .....	2,060	4,399	2,565
Potatoes .....	39,980*	48,241*	52,305*
Hay and clover .....	15,883 <sup>b</sup>	16,397 <sup>b</sup>	.....

\* 1,000 cwt. <sup>b</sup> 1,000 tons. ° Estimates.

The agricultural production in 1931 was less than in any year since 1919, notwithstanding the fact that sowings for the 1931 harvest year were 6,694,486 acres greater than in 1921. The census figures for the acreage sown to the principal crops in the spring of 1921 and 1931 were 47,450,859 and 54,145,345 acres, respectively. The wheat acreage showed the greatest increase (5,839,656 acres). The Dominion Bureau of Statistics estimated the value of the 1931 field crops, on the basis of average prices received at production points up to the end of December, 1931, at \$425,065,000. This was 32 per cent less than the estimated value in 1930 and less than half the average value for the preceding five years. The unit price for the principal grains in cents per bushel for 1931 was calculated at: Wheat, 37 cents; oats, 23 cents; barley, 24 cents; rye, 25 cents; flaxseed, 79 cents. Potatoes sold for an average of 43 cents per hundredweight; and sugar beets for \$5.80 per ton. The 1931 apple, tobacco, sugar beet, potato, root, and fodder crop production was in general greater than in 1930. Final estimates for 1931 crop production: Wheat, 304,144,000 bushels; oats, 328,278,000 bushels; barley, 67,382,000 bushels; rye, 5,322,000 bushels; flaxseed, 2,565,000 bushels; potatoes, 52,305,000 cwt.; sugar beets, 459,000 tons.

Livestock in Canada in 1930, valued at \$687,225,000, included 3,295,000 horses, 3,683,000 milch cows and 5,254,000 other cattle, 3,696,000 sheep, and 4,000,000 swine. The wool clip in 1930 was 21,016,000 pounds, valued at \$2,311,000, as compared with 20,283,000 pounds, valued at \$4,470,000, in 1929. Dairy products in 1929 consisted of: Creamery butter, \$65,929,782; dairy butter, \$28,929,000; factory cheese, \$21,471,330; home-made cheese, \$82,800; milk, \$153,238,000; miscellaneous products, \$22,091,945. There were 1202 creameries and 1290 cheese factories in the Dominion.

**FRUIT FARMING.** The total value of the commercial fruit production of Canada in 1930 was estimated \$19,224,970, as compared with \$19,591,240 in 1929. Apples constitute the most important commercial fruit crop in Canada, production in 1930 amounting to 3,165,936 barrels worth \$10,863,940. Of the other fruits, estimated production and value for 1930 were as follows: Grapes, 51,062,000 pounds, \$1,801,100; strawberries, 12,934,555 quarts, \$1,748,691; peaches, 759,702 bushels, \$1,519,404; cherries, 286,000 bushels, \$861,774. Raspberries, pears, plums and prunes, and apricots were other products. The total value of the 1930 fruit crop was \$17,689,835.

**FISHERIES.** Canada's large salt-water fishing areas are supplemented by 220,000 square miles of fresh water containing many varieties of food fish. Lobsters, halibut, whitefish, pilchards, haddock, salmon, cod, herring, sardines, pickarel, trout, and smelts are the principal commercial fishes caught. The investment in the

industry in 1929 was \$62,579,000 and the number of employees, 80,450. Due to a fall in prices, the total value of the catch in 1930 was \$47,798,920, compared with \$53,518,521 in 1929. Of the 1930 total, sea fisheries contributed \$41,451,977, or 87 per cent, and inland fisheries \$6,346,943 or 13 per cent.

**FORESTS.** With a total forest area of 1,151,454 square miles in 1931, Canada had about 200,000 square miles of mature merchantable timber, 111,234 square miles of immature but merchantable timber, and 554,646 square miles of young growth capable of producing commercial timber eventually, according to the *Canada Year Book* for 1931. The value of woods operations in 1929 was \$219,570,129, compared with \$212,950,799 in 1928. Exports of wood, wood products, and paper in 1930 totaled \$289,566,675 (\$288,621,745 in 1929).

**FUR INDUSTRY.** The number of fur farms in Canada increased by more than 2700 between 1926 and 1929. In the latter year there were 5515 fur farms, with fur-bearing animals valued at over \$16,401,453, and a total capital investment of \$30,659,649. Pelts sold from fur farms (1928) were worth \$2,389,026, compared with \$783,313 in 1925. The total raw fur production in the fiscal year 1928-29, including wild animals trapped, was \$18,054,499; for 1929-30 it declined in value to \$12,218,547 (provisional figure).

**MINERAL PRODUCTION.** Mineral production increased from \$172,000,000 in 1921 to a record net value of \$310,850,000 in 1929, but in 1930 declined to \$278,470,000, due to a drop in metal prices and a smaller output of coal, asbestos, gypsum, and structural materials. Copper and zinc production set a record for volume but not for value in 1930, while both the quantity and value of gold produced exceeded all previous totals. Of the total world mineral production in 1929, Canada produced 85 per cent of the nickel, 68 per cent of the asbestos, nearly 50 per cent of the cobalt, 16 per cent of the copper, 10 per cent of the gold, 9 per cent of the silver, 8 per cent of the lead, and 5 per cent of the zinc. The Dominion contains 16 per cent of the world's known coal resources. The distribution of the 1930 production by Provinces (preliminary figures for 1929 in parentheses), was: Ontario, \$112,288,805 (\$117,062,505); British Columbia, \$54,814,955 (\$68,162,878); Quebec, \$40,966,805 (\$46,359,285); Alberta, \$30,629,997 (\$34,739,986); Nova Scotia, \$26,771,300 (\$30,904,453); Manitoba, \$5,326,568 (\$5,423,825); Yukon Territory, \$2,503,197 (\$2,905,736); Saskatchewan, \$2,298,725 (\$2,253,506); New Brunswick, \$2,270,812 (\$2,439,072).

Preliminary values for the leading mineral products in 1931, with figures for 1930 in parentheses, were: Gold, \$55,395,000 (\$43,454,000); coal, \$41,320,000 (\$53,288,000); copper, \$23,772,000 (\$37,948,000); cement, \$15,922,000 (\$17,818,000); nickel, \$14,697,000 (\$24,455,000); natural gas, \$9,645,000 (\$9,636,000); lead, \$7,241,000 (\$13,103,000); zinc, \$6,019,000 (\$9,636,000); silver, \$5,984,000 (\$10,089,000); asbestos, \$4,611,000 (\$8,390,000); petroleum, \$4,566,000 (\$4,954,000). The total value of mineral production in 1931 was estimated at \$227,768,000, compared with \$279,873,578 in 1930.

Capital invested in the mining industry in 1929 was \$867,021,000, the number of employees was 95,102, and the salaries and wages totaled

\$124,490,511. As a result of the introduction of the airplane for mineral surveys, the prospecting and development of one of the largest unprospected mineral areas in the world was under way in Northern Canada.

**MANUFACTURES.** Canada in 1930 occupied second place in the manufacture of automobiles, third place in paper and aluminum, and fifth place in rubber manufacture. In the amount of hydro-electric energy produced, Canada ranked second among the nations in 1931; new installations of 541,000 horse power during the year brought the total for the whole Dominion to 6,666,000 turbine horse power. Of the 1930 installations, 136,000 were in Ontario, 123,000 in Quebec, and 71,000 in British Columbia.

In 1929, the gross value of manufactured products was \$4,063,987,279 (\$3,769,850,364 in 1928), of which the value added in process of manufacture was \$1,997,350,365 (\$1,819,046,025 in 1928). The 23,597 manufacturing establishments in operation in 1929 represented a capital investment of \$5,083,014,754 and had 693,816 employees, the salaries and wages of which totaled \$813,049,842. Ontario, with a gross value of production of \$2,103,080,788 in 1929, was the leading manufacturing Province. Following in order were: Quebec, \$1,160,612,992; Manitoba, \$104,909,127; Alberta, \$107,556,792; Nova Scotia, \$94,292,816; Saskatchewan, \$80,501,159; New Brunswick, \$71,433,966; and Prince Edward Island, \$4,638,725. The value of production of the leading manufacturing lines in 1929 was: Vegetable products, \$771,457,665; iron and its products, \$738,012,980; wood and paper, \$725,819,740; animal products, \$477,761,855; textile products, \$426,247,587; non-ferrous metals, \$283,545,666; non-metallic minerals, \$242,234,518; chemicals and allied products, \$138,545,221; central electric stations, \$157,499,385.

Production of pig iron in 1930 was 747,178 long tons, or 30.8 per cent less than the record figure of 1,080,000 tons established the preceding year. Steel production totaled 1,009,578 tons, or 26.8 per cent less than the record output of 1,378,000 tons in 1929. Automobile production declined 41.3 per cent, from 262,625 cars in 1929 to 154,192. Newspaper output declined 8.4 per cent to 2,498,631 tons. The daily capacity of Canadian newsprint mills, however, increased from 2630 tons in 1920 to 12,105 tons in 1930. On May 1, 1931, the mills announced a reduction of \$5 per ton in the general price of newsprint at the mill. See **PAPER AND PULP**.

**FOREIGN INVESTMENTS IN CANADA.** A survey by the Dominion Bureau of Statistics in 1931 showed that 1260 branch plants and manufacturing establishments, representing a combined capital of \$1,746,220,000, were owned or controlled by British and foreign interests. American capital owned 1071 branch plants, with an investment of \$1,189,590,000, or 68 per cent of the total; Great Britain, 172 plants and an investment of \$246,616,000, or 14 per cent; and other foreign interests, 17 branch plants and an investment of \$5,982,000, or less than 1 per cent. The remaining \$304,032,000, or 17 per cent of the total investments in foreign enterprises, represented Canadian holdings in such concerns.

Total capital invested in Canada, including Dominion, provincial, and municipal debts but excluding private capital in homes, farms, etc., was estimated by the Bureau at \$17,500,000,000. Of this \$11,500,000,000, or 65 per cent, was

owned in Canada; \$3,500,000,000, or 20 per cent, in the United States; \$2,200,000,000, or 13 per cent, in Great Britain; and less than 2 per cent in other foreign countries. Canada's total national wealth was estimated at \$30,000,000,000, of which about \$6,000,000,000, or 20 per cent, was owned abroad. Canadian investments abroad were estimated at \$1,750,000,000.

**BUSINESS CONDITIONS.** The decline in wheat prices in 1930 and the first half of 1931, following upon the short wheat crop of 1929, seriously deranged the national economy. Curtailment of Canada's export shipments and other effects of the world-wide economic depression accentuated the strain upon the economic structure. Industrial activities in Quebec and Ontario were sharply restricted by the slackened demand for manufactured products from the agricultural Provinces and unemployment assumed serious proportions, necessitating extensive relief projects. The volume of business in the Dominion in 1930 was estimated to have been more than 20 per cent smaller than in the previous year, while with the exception of Nova Scotia and New Brunswick, all the Provinces reported a larger number of commercial failures than in any year since 1923. An upturn in business activity was indicated early in November, 1931, however, after an average increase of 20 cents in the price of wheat and the inauguration of extensive public works projects.

For the first time in Canadian history, manufacturing supplanted agriculture as the premier productive enterprise in 1930, due to the drastic decline in farm prices. In January, 1931, farmers in some districts were receiving but 35 cents a bushel for best-quality wheat, and the drought of the previous summer had left them little grain to sell. Poverty and even hunger stalked the prairies. Cases were reported of farmers subsisting on roasted gophers and soup made of Russian thistles. Grain prices improved markedly in November, 1931, with the aid of a Government subsidy equivalent to five cents a bushel. But the hoped for relief from the 1931 crop failed to materialize in large areas of the West. In the eastern Provinces, crops were fairly good; in the West drought, disease, and insect pests reduced the yields to the lowest recorded for over 10 years. Large groups of farmers and others were utterly dependent upon public aid to carry them through until the 1932 harvest.

The number of unemployed was estimated at the beginning of September by the Minister of Labor at 530,000, distributed as follows: British Columbia, 38,880; Alberta, 14,450; Saskatchewan (cities and towns), 26,904 (drought areas), 150,000; Manitoba, 41,489; Ontario, 130,000; Prince Edward Island, 1500; Quebec, 100,000; Nova Scotia, 18,000; and New Brunswick, 8000.

**COMMERCE.** According to preliminary figures, Canada's external trade for the fiscal year ended Mar. 31, 1931, declined to \$1,723,550,729 from \$2,393,211,652 in the preceding year, or a shrinkage of \$669,660,923. Imports were \$341,660,901 less than in 1929-30, domestic exports were \$320,605,635 less, and reexports \$7,394,387 less. The balance of trade was unfavorable by \$89,674,633 in 1930-31 and by \$103,300,000 in 1929-30. Thus for two years Canada had a small adverse balance on her visible imports and exports, due chiefly to the low prices received for her agricultural products, although a favorable balance

previously had prevailed since 1921-22. For the calendar year 1931, imports totaled \$628,098,000 (preliminary), as compared with \$1,008,479,000 in 1930, while exports amounted to \$617,243,000, compared with \$905,370,000 in 1930. The unfavorable trade balance was reduced from \$103,109,000 in 1930 to \$10,855,000 in 1931.

The accompanying figures showing imports and exports for the years 1924-25 to 1930-31 indicate the steady growth of imports as compared to exports.

#### CANADIAN IMPORTS AND EXPORTS, 1924-25 TO 1930-31

Year ended March 31	Total exports	Imports for home consumption
1924-25 .....	\$1,081,861,648	\$ 796,982,537
1925-26 .....	1,328,700,137	927,828,732
1926-27 .....	1,267,573,142	1,030,892,505
1927-28 .....	1,250,456,297	1,108,956,466
1928-29 .....	1,388,773,075	1,265,679,091
1929-30 .....	1,144,938,070	1,248,278,582
1930-31 .....	816,938,048	906,612,681

The values of imports and exports by industrial groups in 1929-30 and 1930-31 are shown in the accompanying table compiled from the *Canada Year Book* for 1931.

#### CANADIAN FOREIGN TRADE BY INDUSTRIAL GROUPS

IMPORTS	1929-30 *	1930-31 *
Agricultural products ..	\$227,048,817	\$177,628,778
Animal products . . . .	69,853,833	45,995,705
Fibres, textile products	185,241,252	130,717,022

Chemicals . . . . .	22,468,462	12,825,852
Miscellaneous . . . . .	20,057,938	18,115,846
Total domestic exports	1,120,258,302	799,652,667
Total foreign exports	24,679,768	17,285,881
Total exports . . . . .	1,144,938,070	816,938,048
Grand total external trade . . . . .	\$2,393,211,652	\$1,723,550,729

\* Fiscal years ending March 31.

Among the export items, wheat registered the greatest decrease in value in 1930-31, with 217,343,037 bushels valued at \$177,419,769 exported, as compared with 177,006,373 bushels valued at \$215,753,475 in the preceding fiscal year.

Despite the drastic decline in imports from and exports to the United States in 1930-31, that country retained its preponderant position in Canada's foreign trade, taking 44 per cent of all exports and supplying 64 per cent of the imports. Exports to the United States were valued at \$349,571,000, as compared with \$515,050,000 in the previous fiscal year, while imports

from the United States shrank to \$584,429,301 from \$847,442,000 in 1929-30. The United Kingdom, which ranked second in Canada's trade, purchased exports valued at \$219,246,000, compared with \$281,700,000 in 1929-30, and supplied imports worth \$149,488,000, as against \$189,200,000 in the previous fiscal year. Japan, Belgium, Italy, France, and New Zealand, in the order named, were the other leading markets for Canadian exports, while the leading sources of imports after the United States and the United Kingdom were France, Germany, Japan, British India, and the Netherlands. Exports to British Empire countries totaled \$292,884,145 and imports from the Empire \$204,935,079. Imports from Russia, embargoed in 1931, amounted to \$1,917,652 in 1930-31 while exports to Russia totaled but \$568,100. The French islands of St. Pierre and Miquelon (q.v.) off eastern Canada rose to ninth place in the Dominion's foreign trade through the purchase of \$11,004,479 of Canadian goods—mostly liquor destined for re-export to the United States.

**TOURIST EXPENDITURES.** The adverse visible balance of trade with the United States, amounting to \$220,531,277 in 1930-31, was offset in part by the expenditures of American tourists in Canada. In the calendar year 1930, according to the Dominion Bureau of Statistics, expenditures of tourists from all foreign countries totaled about \$280,000,000 (\$308,000,000 in 1929) and expenditures of Canadian tourists abroad were \$113,000,000 (\$122,000,000 in 1929), leaving a credit balance for Canada of \$167,000,000 (\$186,000,000 in 1929). Automobile tourists from the United States alone spent about \$202,500,000 in Canada in 1930 (\$215,577,000 in 1929), while Canadian automobile tourists in the United States spent about \$63,500,000 (\$65,055,000 in 1929). American tourists of every description spent about \$294,077,000 in Canada in 1929, while Canadian tourists in the United States expended about \$95,055,000. In 1931, tourist expenditures shrank \$25,000,000 to \$30,000,000 compared with 1930.

**FINANCE.** For the fiscal year ended Mar. 31, 1931, the Prime Minister reported an overall deficit of \$83,845,000 in the closed account, as compared with a surplus of \$44,507,000 returned in the previous fiscal year. Total expenditures were \$440,060,000 and total revenues \$356,215,000, the expenditures being \$41,848,000 above the 1929-30 figure and the revenues \$89,967,000 less. The ordinary revenues for 1930-31 amounted to \$349,593,000 or \$91,818,000 less than in 1929-30, while ordinary expenditures were \$393,990,000, or \$36,210,000 more than in the previous year. General revenues and expenditures in the Consolidated fund for the years 1924-25 to 1930-31 are shown in the accompanying table.

CANADIAN PUBLIC FINANCE, 1925-31  
[Thousands of Canadian dollars]

Fiscal year ended March 31,	Revenue		Expenditure	
	Grand total	Total ordinary	Grand total	
1925 .....	351,515	318,892	351,170	
1926 .....	382,893	320,660	355,186	
1927 .....	400,453	319,548	358,556	
1928 .....	429,847	336,168	378,868	
1929 .....	461,647	350,953	389,595	
1930 .....	446,182	357,780	398,442	
1931 .....	356,215	398,992	440,060	

All the principal revenue items except the income tax, which was amended in 1930, showed

a decrease in 1930-31 compared with 1929-30, as shown in the following figures (1929-30 figures in parentheses): Customs receipts, \$131,209,000 (\$179,430,000); excise, \$57,747,000 (\$65,036,000); Post Office, \$30,212,000 (\$33,345,000); excise taxes, \$34,735,000 (\$63,409,000); income tax, \$71,048,000 (\$69,021,000). Expenditures included some \$56,000,000 for war pensions to 61,341 persons, a sum representing more than one-seventh of the national income.

The budget for 1931-32, with extensive tariff and tax revisions, was passed by the House of Commons June 18, 1931. The anticipated revenue for the year was reduced \$4,000,000 through the Government's acceptance of the Hoover moratorium proposal (see GERMANY under *History*; REPARATIONS). Revenue from all sources in 1931-32 was estimated at \$403,000,000, of which customs duties were expected to provide \$122,000,000, excise taxes and duties \$159,000,000; and income tax \$63,500,000. Total expenditures were estimated at \$430,458,000, including \$13,000,000 of the 1930 unemployment relief fund carried over to the 1931-32 fiscal year. For the 12 months ended Dec. 31, 1931, ordinary receipts totaled \$277,492,000 and ordinary expenditures \$296,676,000, compared with receipts of \$303,485,000 and expenditures of \$309,530,000 for the calendar year 1930, according to preliminary returns.

The gross public debt of Canada on Mar. 31, 1931, was \$2,673,000,000 (\$2,603,000,000 on Mar. 31, 1930) and the net debt was \$2,262,000,000 (\$2,178,000,000). Of the net funded debt on Mar. 31, 1930, the sum of \$1,804,977,000 was held in Canada, \$257,185,700 was payable in London, and \$165,965,900 in New York. In May, 1931, a \$250,000,000 conversion loan was oversubscribed two and one-half times, thus relieving the Treasury of the necessity of redeeming maturing bonds.

**SHIPPING.** For the fiscal year ended Mar. 31, 1930, a total of 43,468 ocean-going vessels, of 52,992,232 registered tons, entered and cleared Canadian ports, as compared with 45,426 vessels of 54,408,527 tons in 1928-29. Including vessels in the ocean-going, coastwise, and inland international trade, arrivals at Canadian ports in 1929-30 totaled 158,530, of 88,373,217 registered tons; departures, 159,682, of 88,800,345 tons. Vessels on the Canadian registry of shipping in 1930 totaled 8703, of 1,410,432 tons. Halifax, Montreal, Quebec, and Saint John (New Brunswick) and Vancouver were the leading ports.

Direct steamship service between Montreal and the Scandinavian peninsula and between Montreal, Halifax, and Haiti was established during 1931. The opening of Port Churchill on Hudson Bay, calculated to bring European grain markets 1000 miles nearer to the Prairie Provinces, was announced for 1932 and two trial shipments of grain were sent out during the summer of 1931. With the opening of the new Welland ship canal Apr. 15, 1931, the draft of vessels using it was increased from 14 to 18 feet and the average time required for 10 vessels to pass through was reduced from 20 to 7 hours. In 1930, 5252 vessels passed through the canal, or 859 more than in 1929. Work on the Beauharnois ship canal 22 miles west of Montreal, connecting Lakes St. Louis and St. Francis, was under way in 1931 (see below under *History*). When completed in 1933 or 1934, the canal will allow ocean-going vessels of 27-foot draught to

dock at Valleyfield at the eastern edge of Ontario. Meanwhile the deepening of the St. Lawrence waterway between Montreal and Quebec to a minimum depth of 35 feet was in progress, with completion scheduled for 1934.

**RAILWAYS.** The single-track mileage of Canadian railways on Jan. 1, 1930, was 41,409 miles, including 336 miles operated in the United States. In the calendar year 1930, freight traffic, as measured by ton miles, was the lightest in nine years and passenger traffic, as measured in passenger miles, was lighter than for any year since 1909. Gross revenues totaled \$450,398,143, which was \$78,753,980, or 14.9 per cent, less than for 1929. Operating expenses were \$391,383,318, or \$51,693,815 smaller than in 1929, and net revenues were \$72,867,841, as against \$99,928,006 in 1929. The two chief railway systems were the government-owned Canadian National Railways, with a single-track mileage in Canada of 21,563 miles, and the privately-owned Canadian Pacific Railway, with 14,812 miles of single track. Fourteen branch lines of the Canadian National system, authorized by Parliament in 1927, were completed by the end of 1930 at a cost of \$18,128,000. The Temiskaming & Northern Ontario Railway extension from Cochrane, Ontario, to Moose Harbor on James Bay, a distance of 142 miles, was completed on Aug. 31, 1931. A 33-mile line along the west shore of Kootenay Lake in the Canadian Rockies, constituting the final link in the Canadian Pacific's southern route between Winnipeg and Vancouver, was placed in operation Jan. 1, 1931, replacing the former boat and barge service on Kootenay Lake. The Canadian Pacific on May 1, 1931, and the Canadian National in August reduced the salaries of the supervisory staffs by 10 per cent and laid off other employees without pay from two to three days a month. See below under *History*.

**OTHER COMMUNICATIONS.** At the beginning of 1930, Canada had 390,060 miles of highway and roads, as compared with 381,976 miles a year earlier and with 394,372 miles in 1931. Of the 1930 total, 2365 miles were of concrete, 6262 of macadam, 63,514 miles of gravel, and the remainder earth. Construction of the Ontario section of the trans-Canada highway was authorized in 1931 as an unemployment relief measure, the cost to be divided between the Dominion and Ontario governments. The number of automobiles registered in Canada increased from 407,064 in 1920 to 1,239,889 in 1930.

The total mileage flown by civil aircraft in 1930 was 7,547,420 (6,284,079 in 1929), the number of passenger-miles recorded was 5,408,676 (6,114,997 in 1929), the total freight or express carried was 1,759,259 pounds (3,903,908 pounds in 1929), and total mail carried was 474,199 pounds (430,636). There were 70 licensed civil air ports, and 493 licensed civil aircraft at the end of 1930. In the spring of 1930 regular air service was maintained by ten companies over 23 routes having a total length of 6944 miles. Early in 1931 a new air line was opened from Saint John, N. B., to Halifax. In the summer, however operations ceased on five lines, due to financial stringency.

**GOVERNMENT.** Executive power is exercised in the King's name by the Governor-General of Canada, acting through a responsible ministry or cabinet. Legislative power is in a Parliament

of two Houses: a Senate and a House of Commons, the former consisting of 96 members appointed for life and the latter of 245 members in accordance with the distribution act of 1924, elected for five years (unless sooner dissolved) by popular vote, including woman suffrage. Women are eligible for election to Parliament. The Governor-General in 1931 was the Earl of Bessborough, who assumed office Apr. 4, 1931, as successor to Viscount Willingdon, the new Viceroy of India. The composition of Parliament following the election of July 28, 1930, was: Conservatives, 136; Liberals, 89; United Farmers of Alberta, 9; Progressives, 3; Liberal-Progressives, 3; Labor, 3; Independents, 2. The Conservative Ministry sworn in Aug. 7, 1930, in order of precedence, was as follows: Prime Minister, President of the Privy Council, Secretary of State for External Affairs, Minister of Finance, Richard B. Bennett; Minister without Portfolio, Sir George H. Perley; Labor, Gideon D. Robertson; Justice and Attorney-General, Hugh Guthrie; Fisheries, E. N. Rhodes; Trade and Commerce, H. H. Stevens; Railways and Canals, Dr. R. J. Manion; National Revenue, E. B. Ryckman; Minister without Portfolio, J. A. Macdonald; Postmaster-General, Arthur Sauvé; Pensions and National Health, Murray MacLaren; Public Works, H. A. Stewart; Secretary of State, C. H. Cahan; National Defense, Lt.-Col. D. M. Sutherland; Marine, Alfred Duranleau; Interior and Superintendent-General of Indian Affairs, Thomas G. Murphy; Solicitor-General, Maurice Dupré; Immigration and Colonization, and Mines, W. A. Gordon; Agriculture, Major Robert Weir.

#### HISTORY

Intensification of the economic depression, with increasingly adverse effects upon Canadian agriculture, industry, and public finance, brought the tariff and the budget to the forefront of Dominion politics in 1931. In general, industry, and trade bore up comparatively well in the face of acute world-wide business stagnation. The agricultural regions, particularly of the Prairie Provinces, however, suffered a blow which Premier Bennett described as a national calamity (see above under *Business Conditions*).

**POLITICS AND LEGISLATION.** Conditions in the Prairie Provinces gave rise to talk about the repudiation of debts, boycott of manufactured goods, Communistic programmes, and secession from Eastern Canada. In Saskatchewan, the movement for secession gained considerable ground, but it was considered to be primarily intended to wrest concessions from the financial and industrial interests of the east. Unrest and want on the prairies, business stagnation and unemployment throughout Canada, and rapidly declining governmental revenues constituted an acid test of the ability and leadership of Premier Bennett during the unusually long session of Parliament, from March 12 to August 3. He proved himself a man of tremendous energy and capacity, according to the Ottawa correspondent of the *New York Times*, dominating the House of Commons throughout the session and handling all important legislation.

The Conservative Premier was effectively attacked by the Liberal Opposition during the first part of the session for the increase of taxation and his failure to banish the depression. The

waning tide of his political fortunes turned, however, with the exposure of the Beauharnois scandal (see below). The revelations undermined the morale of the Opposition and placed it upon the defensive, while the Premier emerged with enhanced prestige. The all-important developments of the session, however, were the upward revision of the tariff and a noteworthy increase in taxation to offset the \$75,000,000 deficit in the 1930-31 budget. Both measures were elaborated in the Premier's budget speech of June 1 and adopted in substance June 18.

**THE BENNETT TARIFF.** The Premier had been elected by an overwhelming majority in 1930 on a platform of economic nationalism which aimed at excluding American and other foreign competitive imports and making Canada a self-contained nation industrially. He lost no time in putting his pledge of a protective tariff for Canadian industry and agriculture into effect. In the special session of September, 1930, the tariff was increased on 130 items, affecting adversely millions of dollars' worth of imports from the United States. The new rates imposed in 1931 made little alteration in the British preferential tariff but increased materially the intermediate and general tariffs, the latter affecting imports from the United States. Dr. Julius Klein, Assistant Secretary of Commerce at Washington, estimated that the new rates would definitely imperil about \$25,000,000 of American exports to Canada, or about 4 per cent of the value of 1930 shipments. Canadian estimates were higher; in some quarters it was calculated that the 1931 adjustments would cut off ultimately about two-thirds of the goods imported annually from the United States. American products particularly affected by the 1931 changes were automobiles, coal, coke, food and utility products delivered in cartons, live hogs, fresh meats, bacon, hams, canned fruits and vegetables, raisins and oranges, and many other foods and food products.

In an effort to exclude the flood of cheap magazines from the United States, with their advertisements of American products, magazines and periodicals were made subject to a duty of 15 cents a pound. In response to numerous protests, this section was later modified. Magazines with less than 20 per cent advertising content were to enter free, those with between 20 and 30 per cent were made dutiable at two cents a copy, and those with over 30 per cent at five cents a copy. The 15-cents-a-pound rate was retained on newspapers and magazines composed largely of fiction or feature articles.

Mr. Bennett denied that his tariff was promulgated in retaliation for higher duties on Canadian exports imposed by the Hawley-Smoot tariff in the United States. His policy was announced as the conservation of the home market for domestic production. Developments of the year indicated that the Canadian farmers and other groups formerly opposed to a policy of tariff protection were moving in that direction. Labor's interest in increasing factory production and bringing branch factories into Canada from the United States and Great Britain, insured its support of the tariff.

These changes in tariff sentiment boded ill for the future of the Liberal party. The French-Canadians, high-tariff in sentiment, had for years been the dominant element in the party.

With the loss of much French-Canadian support in 1930, the Liberals tended to return to their traditional low-tariff policy. But Free Trade was no longer the popular rallying cry among the farmers of the prairies.

The Liberals denounced the Conservative tariff policy as imposing a heavy and unnecessary burden upon the farmer and thereby ruining the main markets for industries which the tariff was designed to protect. They contended that Canada was essentially a trading nation by reason of its heavy exportable surplus of newsprint, wheat, nickel, asbestos, and other products, and because its limited range of products made it necessary to import a wide variety of commodities. Furthermore, there are distinct obstacles in the way of making Canada industrially self-sufficient. The coal deposits in Nova Scotia and Alberta are remote from the centre of industry in Ontario, and Newfoundland is the nearest Empire source of high-grade iron ore, so far sought without success in Canada.

**THE 1931-32 BUDGET.** The measures inaugurated by Premier Bennett to wipe out the deficit for the fiscal year ended Mar. 31, 1931, included: (1) a special excise tax of 1 per cent on imported goods; (2) an increase of 8 to 10 per cent in the income tax; (3) an increase in the sales tax from 1 to 4 per cent; (4) an increase in letter postage from 2 to 3 cents. The income-tax increase was made applicable to corporations and joint stock companies. Farm aid for export wheat was extended in the form of a reduction of five cents a bushel in the cost of transporting all wheat produced in Western Canada. The coal industry of Western Canada and the Maritime Provinces was subsidized to the extent of \$1,800,000 by means of a sliding scale of bonuses on coal shipped to Ontario and Quebec.

A measure which attracted much criticism was the imposition of a 2 per cent tax at the source on dividends of Canadian securities owned abroad. The measure affected American investments in Canada estimated (1931) at between \$3,600,000,000 and \$3,900,000,000 and British holdings of about \$2,300,000,000. The Premier further announced that on Mar. 31, 1931, 248,000 persons were employed on contracts aggregating \$69,690,948, which had been initiated in accordance with the unemployment relief measure passed at the special 1930 session of Parliament. On Dec. 10, 1931, a deficit of \$100,000,000 was forecast for 1931-32. A national service loan of \$150,000,000 floated in December, 1931, was over-subscribed by \$65,000,000.

**THE BEAUHARNOIS SCANDAL.** One of the major political scandals of Canada's history was provided by a parliamentary investigation of the Beauharnois Light, Heat & Power Company, Ltd., engaged in the construction of a huge hydro-electric power and canal project in the St. Lawrence River near Montreal. The inquiry was authorized by Premier Bennett May 19, 1931, following charges by Robert Gardiner, leader of the United Farmers of Alberta. The committee of inquiry found that the project, although basically sound, had been ruthlessly exploited for the profit of company officials and three Liberal Senators who were close friends of the former Liberal Premier, William Lyon Mackenzie King. The Federal permit for the project had been obtained from the Mackenzie King Govern-

ment. Millions had been added to the overhead through contributions of approximately \$950,000 to the leading political parties in the Dominion, Quebec, and Ontario and by huge profits collected by favored individuals in the original Beauharnois syndicate. The committee outspokenly condemned Senators Andrew Haydon, W. L. McDougald, and Donant Raymond for their relations with the Beauharnois company. It also censured the general-manager and secretary-treasurer of the company. The committee reported that the work being carried on by the company differed in important respects from the plans submitted to the government. Mr. King was forced to admit that he and his party were humiliated by the disclosures, although his own integrity was never in question.

To prevent the threatened collapse of the project due to public loss of confidence in the management, the Government put through Parliament two bills, which received the approval of the Province of Quebec. One of them declared the project of general advantage to Canada and provided for the completion of the work under government supervision. The other cancelled the order-in-council by which the Mackenzie King government authorized the project and the agreement based thereon. The company was restricted to the diversion of not more than 53,000 cubic feet of water a second from the St. Lawrence for power purposes. The Premier promised protection for the legitimate investors in the \$30,000,000 of bonds sold by the company. It was estimated that \$46,000,000 more would be required for the completion of the first 500,000 horse power unit of the power project.

**OTHER LEGISLATION.** Other legislation passed by the 1931 session of Parliament provided for a fact-finding tariff board of three members, appointed by the Premier for 10 years; assistance to vocational students; and the taking over of the Ottawa Mint as a branch of the Canadian Government services. The Federal contribution toward the provincially-controlled old-age pension systems was increased from 50 to 75 per cent. In line with British practice, the necessity of holding by-elections when members of Parliament accepted Cabinet posts was eliminated. Despite Liberal opposition, the Premier was granted unlimited authority to relieve distress and unemployment through public works or by direct relief through the Red Cross. On July 15, Mr. Bennett announced that the government would purchase 2,000,000 bushels of wheat, grind it into 450,000 barrels of flour, and distribute it at a low price in the drought-stricken areas of the west. In response to demands for the immediate institution of unemployment insurance, Premier Bennett stated (April 29) that the government was studying the problem but would not be in a position to submit legislation for some years. He considered the co-operation of the nine Provinces with the Federal Government in a uniform system essential to the success of such a scheme.

A reciprocal trade treaty with Australia, ratified by Parliament, was calculated to give Canada a status in the Australian market equivalent to that of the United Kingdom and much more favorable than that of the United States. The Statute of Westminster, drafted following the Imperial Conferences of 1926 and 1930 to bring empire legislation in line with the changed status of the members of the British Common-

wealth of Nations, was passed by Parliament without a division. The act provided that laws of the United Kingdom do not apply to any dominion unless that dominion so requests. In accordance with the decision of the Federal-Provincial conference held at Ottawa April 7 and 8, the statute stipulated that the British North America Act should remain unaltered. The Premier announced that procedures for amending the Constitution and for dispensing with the judicial appeal to the Privy Council in the United Kingdom would be considered at a future Federal-Provincial conference.

The announcement in the Premier's budget speech that the government-owned Canadian National Railways had failed to earn their fixed charges to the public by \$29,219,738 in the fiscal year ended Mar. 31, 1931, was followed by an investigation of the railway's finances by a Parliamentary committee. The committee recommended the creation of a commission to survey the general problem of Canadian transportation, the abandonment of the government merchant marine which was operated by the Canadian National, and the curtailment of capital expenditures on Canadian National projects. Another act authorized the investigation of the moving-picture industry. The investigator, Peter White, reported July 6 that a monopoly of the industry in Canada had been established by the Famous Players Canadian Corporation and its parent organization, the Paramount Public Corporation of the United States. The Railway commission was established by Order-in-Council November 30 and opened its sittings in Ottawa December 4.

Parliament had been expected to act favorably upon a Royal Commission's recommendation for the establishment of a single national radio-broadcasting company, vested with the powers of a private corporation and the functions of a public utility. Action was held up, however, by the claim of Quebec and Ontario to control of radio transmission and reception within their respective borders. The question went to the Supreme Court of Canada, which decided in July that jurisdiction rested with the Dominion Government. This decision was appealed to the Privy Council. The agitation for Dominion control was primarily the result of the predominant influence of American radio broadcasting in Canada. Four-fifths of the programmes to which Canadians listened came from stations in the United States and many of these were considered detrimental to Canadian institutions and national character.

The exchange value of the Canadian dollar declined following the abandonment of the gold standard in Great Britain (September 21) and on October 19 an Order-in-Council was passed prohibiting the exportation of gold from Canada except by license issued by the Minister of Finance. The move was intended to maintain the statutory gold reserve for the currency and thus prevent the further decline of the Canadian dollar. Effective October 26 to December 31, the par value of the pound sterling for special or dumping duty purposes was fixed at \$4.40, while the value of regular duty remained at \$4.8663.

**FOREIGN RELATIONS.** Canada's foreign relations during 1931 were marked by a continuance of friendly relations with the United States, tariff difficulties with New Zealand, an embargo on imports from the Soviet Union, and the conclusion of a mutually favorable trade agree-

ment with Australia. The Washington Government took the stand that there was nothing discriminatory in the Canadian tariff revisions and made no protest thereto. A new Canadian Minister to the United States, Major W. D. Herridge, presented his credentials to President Hoover June 23, 1931. Shortly afterward occurred the marriage of Major Herridge to Miss Mildred Bennett, sister of the Prime Minister.

Negotiations with regard to the international St. Lawrence waterway project continued and on Oct. 7, 1931, the Canadian Government formally notified the Washington Government that it was ready to undertake the negotiation of a treaty. The Dominion Government seemed to have committed itself to the project in principle through the preamble to the law under which it assumed supervisory control of the Beauharnois project. The preamble stated that the development of a deep waterway was "now in progress, from Lake Superior to the sea through the Great Lakes and connecting waters and in part in, over, or along the St. Lawrence River. . . ." It went on to assert that this fact required that the Beauharnois power work "should hereafter be under the legislative jurisdiction of the Parliament of Canada and be made available for navigation for vessels of such size and draught as may use the new Welland Canal upon its completion." Opposition to the project was voiced by Premier Taschereau of Quebec.

Rum-running activities of Canadian ships along the Atlantic coast of the United States served to irritate sections of American public opinion. Charges that a Canadian rum-runner had "gassed" an American Coast Guard vessel with noxious fumes were forwarded to Ottawa by the U. S. State Department on July 20. The Speech from the Throne, closing the second session of the Seventeenth Parliament (August 3), expressed wholehearted approval of President Hoover's "generous and constructive" moratorium proposal. The depreciation of the Canadian dollar with relation to the United States dollar aroused some resentment in Canada toward the end of the year.

Premier Bennett's precipitate action in doubling the Canadian duty on New Zealand butter provoked drastic retaliation. New Zealand on June 1 withdrew the imperial preference accorded on imports from Canada, thus severely penalizing Canadian exports as compared with those from other parts of the Empire. Canada then opened negotiations for the conclusion of a mutually satisfactory trade agreement. In 1930, Canada shipped goods valued at £3,802,925 to New Zealand and purchased goods valued at £2,539,212 in return. Failing to secure a satisfactory revision of the trade treaty with France, the Government on Dec. 17, 1931, abrogated the treaty, effective June 16, 1932.

The embargo on Soviet products was imposed by an Order-in-Council proclaimed Feb. 27, 1931, which asserted that Soviet coal and lumber were produced by forced labor, that political prisoners were exploited in the Soviet Union, and that the standard of living was below "anything conceived of in Canada." The Soviet Commissar for Foreign Trade retaliated by forbidding the importation of any goods from Canada or the use of Canadian bottoms by Soviet importing organizations.

The financial difficulties of Newfoundland (q.v.) during the year attracted attention to

the relations of the two dominions. In response to questions in Parliament, Prime Minister Bennett was quoted as saying that Canada was considering the possible purchase of the Labrador Coast from Newfoundland but that no political union of Canada and Newfoundland was contemplated.

The Imperial Economic Conference, scheduled to meet in Ottawa in August, 1931, was postponed to 1932 because of impending elections in Australia and New Zealand and the hopelessness of obtaining an agreement satisfactory to the Dominions from the British Labor Government. Canada's effort to improve the condition of her wheat farmers through the calling of the International Wheat Conference at Canada House, London, England, in May failed through the inability of the countries represented to agree upon a plan for acreage reduction. Demands for legislation to check Oriental immigration to the west coast were presented to Parliament by members from British Columbia (q.v.). The House of Commons on May 15 unanimously approved the adhesion of Canada to the General Act for the Pacific Settlement of International Disputes, subject to the reservation agreed upon at the Imperial Conference of 1930. See LEAGUE OF NATIONS; ARBITRATION, INTERNATIONAL.

OTHER EVENTS. Communist activities in Canada during the year resulted in a round up of five alleged "key men" of the organization by provincial and Royal Northwest Mounted Police in August. The Dominion Bureau of Statistics took a 1931 business census of merchandising and service establishments in Canada, the first since 1924. On Oct. 22, 1931, the British Privy Council ruled on an appeal carried from the Canadian Supreme Court that the control of aviation lies with the Dominion and not with the provincial governments. Opposition to Dominion control centred chiefly in Quebec. The Quebec election of August 24 resulted in the continuance in office of the administration of Premier Taschereau (see QUEBEC under *History*). In Prince Edward Island the Liberal administration was defeated by the Conservatives in the election of August 6 (see PRINCE EDWARD ISLAND). See NAVAL PROGRESS; COMMUNISM.

BIBLIOGRAPHY. Consult J. Alexander Aiken, *Economic Power for Canada* (New York, 1930).

CANADA, THE UNITED CHURCH OF. The designation applied to the single body formed by the union of the Congregational, Methodist, and Presbyterian churches in Canada; the Methodist churches of Newfoundland and Bermuda are also included. Since the formal consummation of the union on June 10, 1925, a total of 600 congregations, mostly in smaller towns and rural districts, had amalgamated into approximately one-half that number of self-supporting charges. The board of home missions had also established 412 new fields of home-missions status, each field including three or four places at which public worship had been inaugurated and regularly conducted. Since 1925, 688 fields, which formerly received aid, had become self-supporting and had passed off the home-mission list. Foreign mission work was being carried on in Japan, Korea, China, India, Trinidad, and Angola (West Central Africa).

In 1930 there were in Canada, Newfoundland, and Bermuda 7633 preaching places (including home missions) in 3041 pastoral charges. Between June 10, 1925, and Dec. 31, 1930, the

communicant membership had increased from 600,522 to 662,450, and the number of persons under pastoral care from 1,261,778 to 1,574,152. In the same period 153,000 persons were received as communicants on profession of faith. The fourth general council of the United Church of Canada was held in London, Ont., in September, 1930. The Rt. Rev. Edmund H. Oliver, D.D., F.R.S.C., was chosen moderator for 1930-32; the Rev. T. Albert Moore, D.D., was secretary. Headquarters are at 421 Wesley Buildings, Toronto, Ont.

**CANALS.** In the United States interest in waterways was centred on three areas. The Isthmian ship canal situation, involving the relative merits of the Panama and Nicaragua routes, was again brought to the fore after many years of peaceful slumber. The St. Lawrence waterway proposals were also actively discussed and involve the nearly completed Welland Canal and the future of the New York State Barge Canal. Finally, in the Middle West the operations of the Inland Waterways Commission continued to furnish a storm centre which focused attention on the problems of utilizing the great Ohio River Canalization, the Illinois Waterway, and the related river improvements of the Federal Government.

**THE ISTHMIAN SITUATION.** It would appear that there is actually no isthmian canal situation and that proposals for a Nicaraguan Canal are premature and have no economic *raison d'être*. Under the direction of Lieut-Col. D. I. Sultan, Corps of Engineers, U. S. Army, who was named by President Hoover to succeed the late Lieut-Gen. Edgar Jadwin on the Inter-oceanic Canal Commission, a new survey of this route was completed. The report showed that a canal of 80,000,000 tons yearly capacity was feasible from the engineering standpoint at an estimated cost of \$750,000,000. Colonel Sultan, however, admitted that there was no present need of such construction although he believed that the time would come when the Panama Canal would be taxed to full capacity.

In reviewing this report, Gen. Lytle Brown, Chief of Engineers, U. S. Army, noted that an estimate of the present traffic capacity of the Panama Canal indicated 70,000,000 tons per annum or sufficient for the maximum traffic to be expected in 1970. Furthermore this capacity can be increased to 107,000,000 tons by the construction of a third set of locks at a cost of \$104,000,000. Ten years would be required for this work.

Statistics show that 1928 was the peak year to date for Panama traffic and that the Canal in 1931 was being operated at about one half capacity. While in recent years oil shipments from California fields caused a sharp increase in the slope of the graph on the chart representing traffic growth, it was clearly unreasonable, as canal enthusiasts had done, to project this part of the growth graph and thus conclude that the Canal would be taxed to capacity within a few years. Such growth would be out of all proportion to normal traffic increase.

The present minimum capacity at Panama was 32 lockages per day, and the maximum yet required was 16.7 in 1928. This present capacity is limited by the water supply available and steps were being taken to increase the water supply, and incidentally to remedy the present occasional canal delays due to flood difficulties,

by building a large reservoir on the upper Chagres River. This construction was authorized by Congress in March, 1928 and was made the special subject for study by a board of consulting engineers which reported in January, 1931. On September 14 the contract for the work was let for \$4,048,657.

Due to heavy rains, lasting three days, over the Gatun watershed, it was necessary to suspend traffic through the Canal November 7 for the first time since October, 1923. The suspension was due to the fact that it was necessary to supplement the discharge of the Gatun spillway by using the lock culverts to discharge the flood waters from Gatun Lake. While traffic was resumed in part the next day it was expected that the Madden Reservoir, as just noted, would make such delays unnecessary in the future.

Due to the same heavy rains the closing of the Canal on November 7-8 was followed by a slide in the Gaillard Cut on November 9. The slide occurred in the east bank about half a mile north of Gold Hill and traffic was not resumed until November 11 when 14 vessels of drafts up to 25 feet were passed.

Statistics for the year showed the smallest volume of traffic in six years with December the lowest month. See PANAMA CANAL.

**ST. LAWRENCE WATERWAY.** The joint Canadian-American engineering board reached substantial accord on this great project and it was a foregone conclusion that the American engineers would agree to the two-stage development urged by the Canadians. There were many details to be smoothed out, however, before work could actually begin. The treaty under which the construction of this waterway was to be undertaken was to be negotiated through diplomatic channels rather than by a joint commission appointed for the purpose.

Opinion seemed to differ as to the need for this waterway. The head of the Farm Board, for example, took the position that grain exports were nearing their end, due to the fact that other countries were increasing their grain production and were making rapid progress toward replacing the supply heretofore drawn from the United States. This change, plainly indicated by the grain market situation of the previous two or three years, would remove all support for the always questionable grain-freight argument which had been basic in plans for an ocean vessel waterway.

The status of the New York State Barge Canal was of course directly connected with the problem of securing an outlet from the Great Lakes to the sea. Legislation looking toward the taking over of the unprofitable Barge Canal by the Federal Government was passed in 1930 but completion of this step was still awaiting acceptance by New York State of the requirements laid down by Congress.

**INLAND WATERWAYS CORPORATION.** Despite a loss in bulk traffic and unfavorable operating conditions, the Mississippi River barge line made a net operating income of \$65,177.09 in 1930 as compared with a deficit of \$72,798.08 in 1929. Gen. T. Q. Ashburn, head of the corporation, explained that earnings for 1930 were largely due to increased operating efficiency.

The Interstate Commerce Commission in February agreed to permit extension of barge service up the Illinois River as far as Peoria. This was to be done as fast as the river was made

ready for navigation. The terminal at Peoria was practically completed by the end of the year. Opponents of this government transportation operation continued to point out that no allowance was made for taxes or interest on the cost of facilities, and the government was entering into unfair competition with established carriers, namely the railroads, which pay both taxes and interest on the cost of right-of-way and other equipment.

**ILLINOIS WATERWAY.** The U. S. War Department finally agreed to take over and complete the Illinois waterway, inasmuch as the State of Illinois was unable to finish the work within the \$20,000,000 bond issue approved and since the State constitution did not permit an additional bond issue. It was confidently predicted that this 63-mile connecting link between the Chicago Drainage Canal and the Illinois River on the proposed Great Lakes-Gulf Waterway, would be completed in 1932, a year ahead of schedule. Plans and procedure for the work were approved, Federal funds were made available, and contracts were let. A 9-foot depth of water with a waterway 200 feet wide was to be provided. Five locks and dams are required. The lock chambers will be 110 feet wide and 600 feet long with 14 feet of water over the sills. Works at Lockport, which include a notably high lift of 41 feet, and also at Marseilles and Starved Rock had been completed.

On the upper Mississippi River work on the existing project for a 6-foot channel as far as Minneapolis was continued. This is being carried out in such a manner that it can be fitted into a projected channel of 9 feet depth. On the Missouri River Government activities were confined chiefly to revetment and dike construction in connection with the existing 6-foot channel project from the mouth to Sioux City.

**CAPE COD CANAL.** The Secretary of War transmitted to Congress a report of the Chief of Engineers on a preliminary examination and survey of the Cape Cod Canal. This Canal was bought from private interests by the Federal Government as noted in the 1930 YEAR BOOK. There has always been difficulty with rapid currents caused by the tidal differences in Cape Cod Bay and Buzzards Bay, and the report proposed to modify the existing sea level construction by introducing a lock. Tentative dimensions of 1000 feet in length, 250 feet in width, with 40 feet depth of water over the sill were suggested. Improvements in width, depth, and alignment were also recommended.

**ALL-AMERICAN CANAL.** Having reached an agreement as to the allocation of the water, to be supplied by the new Hoover Dam on the Colorado River through the All-American Canal, representatives of the water users met September 7 in Washington to work out details of the contract with the government officials. This canal was authorized as part of the great Boulder Canyon project and the water users have contracted for repayment of the cost of the canal, which will run from the Colorado to the Imperial Valley in Southern California.

Objections to the construction of the Imperial diversion dam, which will divert water from the Colorado to the Canal below the Hoover Dam, were overruled by Secretary Wilbur on October 22. The Palo Verde Irrigation District claimed that back water from this essential part of the project would damage their works. Provisions

against such possible damage were included in the contract, said Secretary Wilbur.

While detailed plans had not been decided upon the Imperial Valley project was provided for to the extent of \$38,500,000 in the \$165,000,000 to be spent in the entire Boulder Canyon work. The canal will be 75 miles long and will require about 65,000,000 cubic yards of excavation. The canal section is to be 134 feet wide at the bottom, 200 feet at the water surface, and 22 feet deep, with a capacity of 15,000 cubic feet of water per second. Provision had not been made for the so-called Coachilla Branch Canal, not included in the original project, which will be 115 miles long. See also DAMS under *Hoover Dam*.

**SUEZ CANAL.** The world-wide depression which has affected traffic on the Panama Canal, as noted above, has also resulted in decreased tonnages passing through the Suez waterway. During the first three quarters of 1930, ships of 23,834,000 net tons passed through the canal, a decrease of over a million net tons from the corresponding period of 1929. See *SUEZ CANAL*.

**CANARY ISLANDS.** A group of small islands off the northwest coast of Africa, belonging to Spain. Area, 2810 square miles; population, estimated at 554,750 on Jan. 1, 1930. Santa Cruz de Teneriffe, with an estimated population of 58,173 (Jan. 1, 1930), and Las Palmas, population 73,737, are capitals of the two provinces into which the islands were divided in 1927. Fruits and vegetables are grown for export. There is regular steamship, cable, and wireless communication with continental Spain, of which the islands are administratively a part. See *SPAIN*.

**CANCER.** See *CHEMISTRY, INDUSTRIAL*.  
**CANTON PROVISIONAL GOVERNMENT.** See *CHINA* under *History*.

**CAPE COD CANAL.** See *CANALS*.

**CAPE COLONY.** See *CAPE OF GOOD HOPE COLONY*.

**CAPE OF GOOD HOPE PROVINCE.** The southernmost of the four original Provinces of the Union of South Africa; formerly known as Cape Colony or the Colony of the Cape of Good Hope. Capital, Cape Town. Area, 276,536 square miles; population at the census of 1921, 2,781,542, of whom only 650,327 were Europeans. The total estimated population on June 30, 1930, was 3,105,943, including 749,314 Europeans, 1,821,882 Bantus, 8035 Asiatics, and 526,712 of mixed and other origin. The white population at the census of May, 1931, was 748,455. The census of 1926 showed 706,137 Europeans. The chief towns, with their white populations in 1926, were: Cape Town, 130,568 (146,249 in 1931); Kimberley, 17,268; Port Elizabeth, 33,371; East London, 23,210. The movement of population in 1929 among Europeans was: Births, 19,008; deaths, 7315; marriages, 6560. For non-Europeans, so far as registered, it was: Births, 39,426; deaths, 25,637; marriages, 9620.

Education is compulsory for white children. In 1929, there were 2351 public and 34 aided private schools for white children, with 141,109 pupils, and 2319 public and aided private schools for colored children, with 199,693 pupils. Education of non-Europeans is carried on mainly by missionary and church bodies. The total ordinary provincial expenditure in 1928-29 was £4,231,045 and the total revenue was £4,214,367, including £2,410,506 received as a subsidy from

the Union Government. Administrator of the Province in 1931, J. H. Conradie, appointed 1929. See SOUTH AFRICA, UNION OF.

**CAPE VERDE (vürd) ISLANDS.** A group of 14 islands about 320 miles off the western coast of Africa belonging to Portugal. Area, 1517 square miles; population in 1929, 153,738, including 54,559 Negroes, 94,977 mulattoes, and 4202 whites. Sisal, castor oil, coffee, mustard, brandy, oranges, and hides are the chief products. Imports in 1929 were valued at 80,955,304 escudos and exports at 4,380,581 escudos (1 escudo exchanged at about \$0.0447 in 1929). The budget for 1930-31 estimated revenue and expenditure at 19,621,660 escudos. A total of 1593 ships of 4,197,000 tons entered the ports in 1929. St. Vincent, the chief port, is a transatlantic coaling station. A Governor administers the islands from Praia (Praya), the capital. Governor in 1931, Col. Antonio A. Guedes Vaz. See PORTUGAL.

**CARAWAY, THADDEUS H.** An American lawyer and U. S. Senator, died in Little Rock, Ark., Nov. 6, 1931. He was born in Stoddard Co., Mo., Oct. 17, 1871, and was graduated from Dixon (Tenn.) College in 1896. Admitted to the Arkansas bar in 1900, he practiced in Lake City, and was twice elected, in 1908 and 1912, prosecuting attorney for the Second Judicial Circuit of Arkansas. In 1931 he was elected to Congress as Democratic Representative from the First Arkansas District and continued there until 1921; when he was chosen U. S. Senator. He was re-elected in 1926 for the term expiring in 1933.

**CARDINALS.** See ROMAN CATHOLIC CHURCH.

**CARINTHIA, ka-rin'thi-ä.** A Province of the Republic of Austria; formerly a crownland of the Austro-Hungarian Empire. Area, 3680 square miles; population at the census of 1923, 370,817, as compared with 396,200 in 1910. Capital, Klagenfurt, with a population in 1923 of 27,423. See AUSTRIA.

**CABLETON COLLEGE.** A coeducational institution of higher learning in Northfield, Minn., founded in 1866 and maintaining relations of cooperation with the Congregational, Baptist, and Protestant Episcopal churches. The enrollment of the autumn of 1931 was 865. There were 64 faculty members. The endowment amounted to \$2,837,381, and the total income of the year was \$567,674. There were 101,000 volumes and 31,000 pamphlets in the library. President, Donald John Cowling, Ph.D., D.D., LL.D.

**CARNEGIE CORPORATION OF NEW YORK.** Established by Andrew Carnegie in 1911, this corporation was formed for the advancement and diffusion of knowledge and understanding among the people of the United States, Canada, and the British colonies. Its total endowment is approximately \$135,000,000 of which \$10,000,000 is applicable elsewhere than in the United States. The corporation has conceived its function to be not that of an operating agency in itself, but rather that of an agency charged with the duty of studying and estimating those forces and institutions that make for the advancement and diffusion of knowledge and understanding in the areas specified and of aiding these institutions in such measure as may be possible within the income of the corporation, having care always to the fact that the income of this endowment is to be a liquid asset for each generation. In the year 1931, as in the previous year of 1930, approximately

two-thirds of the annual income of the corporation was devoted to a reduction of unpaid obligations which on September 30 amounted to \$19,747,531. The annual report of the president, Frederick P. Keppel, showed that during the fiscal year 1930-31, the sum of \$3,629,500 was appropriated. Of this amount, \$880,700 was applied toward library service; \$282,500 toward the encouragement of adult education activities; \$537,000 toward the support of national organizations in the field of fine arts and of departments of art in colleges and universities and of projects for developing appreciation of the arts; \$892,000 toward the support of educational and scientific studies and research publications; and \$1,037,300 toward general interests, including the Carnegie Endowment for International Peace.

The corporation made scholarship grants for graduate study by prospective college teachers of the arts and qualified students of library science. It continued to support various important projects, such as research in the study of paleontology and genetics, investigation in the field of spectroscopy, and study of susceptibility to infectious diseases. Various studies conducted by the American Historical Association, the Institute of Economics, and the American Law Institute were continued through the year. From the income of its \$10,000,000 fund, the corporation continued its five-year programme in British Africa, involving a total of \$500,000. This included scientific research, aid to Jeanes Schools, exchange of educational visits, and library service, carried on largely through responsible local bodies. Various educational enterprises in Canada, Australia, and New Zealand also were aided.

The trustees of the corporation in 1931 were: James Bertram, Nicholas Murray Butler, John J. Carty, Samuel Harden Church, Robert A. Franks, William J. Holland, David F. Houston, Henry James, Frederick P. Keppel, Russell Leffingwell, John C. Merriam, John A. Poynton, and Elihu Root. Officers of administration were: Elihu Root, chairman of the board; Robert A. Franks, vice chairman and treasurer; Frederick P. Keppel, president; James Bertram, secretary; and Robert M. Lester, assistant to the president. The headquarters are located at 522 Fifth Avenue, New York City.

**CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING, THE.** A foundation established on Apr. 16, 1905, by Andrew Carnegie who placed an endowment of \$10,000,000 in trust with 25 trustees, mostly presidents of universities and colleges, for the purpose of encouraging higher education in the United States, Canada, and Newfoundland. The foundation provides retiring allowances for teachers in universities and colleges and pensions for their widows, and studies various phases of the educational process. It was incorporated by Act of Congress in 1906. Its resources were increased by a further gift of \$5,000,000 from Mr. Carnegie in 1908, and by appropriations of \$1,250,000 in 1913 and \$12,000,000 in 1918 from the Carnegie Corporation of New York, which Mr. Carnegie established in 1911. On June 30, 1931, the foundation had endowments and accumulated reserves amounting to \$31,824,500, and had distributed \$21,979,800 in retiring allowances and pensions to 1229 teach-

ers and 599 widows, chiefly through 95 associated institutions, selected for their educational standing.

The foundation publishes extensive annual reports, which deal with many educational problems. Its division of educational inquiry, established in 1913, has issued 26 comprehensive bulletins, dealing with medical, legal, engineering, dental, and vocational education, the training of teachers, intercollegiate athletics, and kindred subjects. In 1931, the foundation was engaged in comprehensive studies of policies respecting public higher education in California, upon legislative and executive invitation, and the relations between secondary and higher education in Pennsylvania. Dr. Henry Suzzallo is president, Dr. Henry Smith Pritchett, president emeritus; Howard J. Savage is secretary. The headquarters are at 522 Fifth Avenue, New York City.

**CARNEGIE INSTITUTE OF PITTSBURGH.** See ART EXHIBITIONS; ART MUSEUMS.

**CARNEGIE INSTITUTE OF TECHNOLOGY.** A nonsectarian institution for technical education at Schenley Park, Pittsburgh, Pa., founded in 1900. The enrollment for the autumn of 1931 was 5262, including 2544 registered in the regular day courses and 2718 in the evening courses. For the summer session 826 students were enrolled. The faculty numbered 427, of whom 294 were on full time and 133 on part time. The endowment of the institution was \$16,383,000 and the annual income \$880,900 (not including student fees.) The institute has a campus branch of the Carnegie Library of Pittsburgh, which has 450,600 volumes. President, Thomas Stockham Baker, Ph.D., LL.D., Sc.D.

**CARNEGIE INSTITUTION OF WASHINGTON.** An organization founded in 1902 "to encourage in the broadest and most liberal manner investigation, research, and discovery, and the application of knowledge to the improvement of mankind." The institution attempts to advance fundamental research in fields not normally covered by the activities of other agencies, and to concentrate its attention upon specific problems with the idea of shifting attack from time to time to meet the more pressing needs of research. Its major activities in 1931 were carried on through the following departments and divisions: Department of embryology (located in the Hunterian laboratory of the Johns Hopkins University medical school); department of genetics (laboratory in Cold Spring Harbor, Long Island, N. Y.); geophysical laboratory; division of historical research, including the section of aboriginal American history, section of United States history, and section of the history of science; department of meridian astrometry (headquarters in the Dudley Observatory, Albany, N. Y.); Mount Wilson Observatory, in Pasadena, Calif.; nutrition laboratory, in Boston; division of plant biology (central laboratory at Stanford University); department of terrestrial magnetism; Tortugas (Fla.) laboratory of marine biology.

During 1931 the institution undertook special studies of the oceanographic material obtained during the last cruise of the *Carnegie* in 1928-29, and it was expected that comprehensive reports on this material, through the aid of many coöperating agencies, would be available in the near future. Arrangements also were made, through the generous coöperation of Johns Hop-

kins University, for increasing the space occupied by the animal colony being studied by the department of embryology, thus enlarging the scope of the investigations leading to an understanding of the structure and physiology of the adult. At the Mount Wilson Observatory progress was made during the year on investigations concerning the structure and extent of the physical universe, the studies by visiting and collaborating investigators proving of great importance. Publication of Morris's elaborate monograph *The Temple of the Warriors*, describing the Caracol at Chichen Itzá in Yucatan, completed one of the great projects of the institution in the field of early American history. Progress also was made in the other phases of the institution's programme relating to the Maya civilization and to knowledge of aboriginal American cultures.

Public lectures and exhibits relating to the work of the institution proceeded as usual, with increasing emphasis upon determination of the most effective means for the dissemination of such information. Results of the institution's investigations are made known through technical and scientific journals, the institution's *Year Book*, and a series of scientific monographs. During 1931 the executive committee authorized publication of 11 new volumes, and a total of 14 volumes were issued. Total receipts, representing interest on investments, bank balances, and sales of publications, amounted to \$1,691,030 for the year. The president in 1931 was John C. Merriam. The officers of the board of trustees were: Elihu Root, chairman; Henry S. Pritchett, vice chairman; Frederic A. Delano, secretary. The executive committee included: Elihu Root, chairman, Frederic A. Delano, Cass Gilbert, John C. Merriam, W. Church Osborn, W. Barclay Parsons, Stewart Paton, and Henry S. Pritchett. Headquarters are at Sixteenth and P Streets, N.W., Washington, D. C.

**CAROLINE ISLANDS.** A group of about 500 coral islets in the western Pacific, transferred from Germany to Japan under mandate of the League of Nations by the Versailles Peace Treaty. The chief islands are Ponapé, with 8551 inhabitants; Yap, an important wireless and cable station, with 6799; and Parao, with 7872. See JAPAN.

**CARR, HERBERT WILDON.** A British philosophical writer, died in Los Angeles, Calif., July 8, 1931. Born Jan. 16, 1857, he was educated at King's College, University of London. After being engaged in banking for many years he became in 1918 professor of philosophy at King's College, and at the time of his death was visiting professor of philosophy at the University of Southern California. He was also president of the Aristotelian Society during 1916-18 and editor of the *Proceedings* of that body. His publications include: *The Problem of Truth* (1912); *Henri Bergson* (1912); *The Philosophy of Change* (1914); *The Philosophy of Benedetto Croce* (1918); *Bergson's Mind Energy* (Trans., 1920); *The Principle of Relativity* (1920); *Genetic's Theory of Mind as Pure Act* (Trans., 1921); *A Theory of Monads* (1922); *The Scientific Approach to Philosophy* (1924); *Changing Backgrounds in Religion and Ethics* (1927); *The Unique Status of Man* (1928); *The Free-will Problem* (1928); *Leibnitz* (1929); and *Cogitans Cogitata* his last work, was published in 1930.

**CARBOLL, HENRY KING.** An American clergyman, died in North Plainfield, N. J., Jan. 21, 1931. He was born in Dennisville, N. J., Nov. 15, 1848. From 1876 to 1898 he was religious and political editor of the *Independent*, and in 1890 had charge of the religious census of the United States. After serving as a special United States commissioner to Porto Rico during 1898-99, he was appointed assistant corresponding secretary of the Methodist Episcopal Church Missionary Society, retaining that post until 1908. He was executive secretary of the western section of the Ecumenical Methodist Conferences of 1911 and 1921, and from 1913 to 1916 was an associate secretary of the Federal Council of the Churches of Christ in America. Besides government reports and numerous reviews, he published *The Religious Forces of the United States* (1893); *Missionary Growth of the Methodist Episcopal Church* (1907); and *Francis Asbury in the Making of American Methodism* (1923). His findings as general religious statistician for the leading Protestant denominations in the United States also were published each spring from 1916 to 1930 in the *Christian Herald*.

**CARS, MOTOR.** See **AUTOMOBILES**.

**CARSON, HOWARD ADAMS.** An American civil engineer, died in Malden, Mass., Oct. 26, 1931. He was born in Westfield, Mass., Nov. 28, 1842, and was graduated from the Massachusetts Institute of Technology in 1869. In 1871 he was appointed assistant engineer on the construction of the Providence waterworks and two years later installed the sewer system in that city. From 1878 to 1885 he was principal superintendent of construction of the Boston system of intercepting sewers and main drainage, and in 1889 was appointed chief engineer of the Metropolitan and Charles River Valley sewerage systems, which embraced about 20 cities and towns in the vicinity of Boston. During 1894-1909 he was chief engineer for the Boston Transit Commission, having charge of the design and construction of the original Boston subway, completed in 1898, and of the East Boston and Washington Street tunnels. He also served as consulting engineer in the building of the original New York and Philadelphia subways and of the double-track railway tunnel under the Detroit River for the Michigan Central Railroad.

**CARTELS.** See **CHILE**; **CUBA**.

**CASE SCHOOL OF APPLIED SCIENCE.** An engineering college in Cleveland, Ohio, founded in 1881. In the autumn of 1931 the enrollment was 808 students. The summer session registration was 162. The faculty numbered 79 members. The endowment amounted to \$4,601,042. The library contained 25,000 volumes. President, William Elgin Wickenden, D.Eng., D.Sc.

**CASUALTY INSURANCE.** See **INSURANCE**.

**CATALAN.** See **SPANISH LITERATURE**.

**CATALONIA (CATALUÑA).** A formerly independent principality occupying the north-east corner of Spain, which was deprived of its liberties and parliament in 1714 by Philip V of Spain and divided in 1833 into the four Provinces of Barcelona, Girona, Lérida, and Tarragona. The area is 12,427 square miles; the population was estimated at 2,475,793 on Jan. 1, 1930. Barcelona, the principal city, had 775,271 inhabitants on the same date. It is the centre of a thriving industrial, commercial, and agricultural region. For political developments in 1931, consult the article on **SPAIN** under *History*.

**CATHOLIC ACTION.** A Roman Catholic organization, the Italian general and branch headquarters of which were closed by the Fascist Government in May, 1931, for alleged political activity. See **ITALY** under *History*.

**CATHOLIC CHURCH.** See **ROMAN CATHOLIC CHURCH**.

**CATHOLIC UNIVERSITY OF AMERICA, THE.** A national institution of higher education in Washington, D. C., founded in 1887 by the Roman Catholic hierarchy with the approval of the Holy See and chartered by an Act of Congress. The enrollment for the autumn term of 1931 was 1340, distributed in the following schools: Graduate school of sacred sciences, 9; seminary, 156; canon law, 24; law (coeducational), 40; engineering, 158; arts and sciences, 440; and graduate school of arts and sciences (coeducational), 502. The enrollment for the summer session of 1931 was 891. Affiliated with the university is the Catholic Sisters' College (190 students); Trinity College for Women (375 students); National Catholic School of Social Service (52 students); and 33 religious houses of study in the immediate vicinity with an enrollment of about 800 students. In addition, there are affiliated throughout the United States 4 seminaries, 29 colleges, 225 high schools and academics, and 57 novitiates.

The university is governed by a board of trustees (prelates, priests, and laymen) through the Rector, who is advised by an academic senate composed of representatives (lay and clerical) of the various faculties. The faculty of the university proper numbered 140, of whom 39 were full professors. The endowment amounted to approximately \$3,000,000, plus an annual collection of about \$300,000. The library contained 340,000 volumes. Administrative officers: the Rt. Rev. James H. Ryan, S.T.D., Ph.D., LL.D., Litt.D., rector; the Rt. Rev. Edward A. Pace, S.T.D., LL.D., vice rector; the Rt. Rev. David T. O'Dwyer, procurator; and Prof. Richard J. Purcell, Ph.D., general secretary.

**CAUCASUS, kô'ká-süs.** A term applied to the isthmus which separates the Black Sea from the Caspian Sea; formerly an administrative division of the Russian Empire. It was divided into two districts of Transcaucasia and Ciscaucasia, of which the former, after the World War, was divided among the three republics of Armenia, Georgia, and Azerbaijan. These were incorporated under the constitution of 1923, in the Union of Soviet Republics, as the Transcaucasian Socialist Federated Soviet Republic. See **ARMENIA, AZERBAIJAN, GEORGIA, TRANSCAUCASIAN SOCIALIST FEDERATED SOVIET REPUBLIC, and UNION OF SOVIET SOCIALIST REPUBLICS**.

**CELEBRATIONS.** These events continue to present to the public anniversaries that are noteworthy and emphasize by appropriate ceremonies their historical importance. Those in the United States were notably of events pertaining to the War of the Revolution and culminated in the celebration of the surrender of Cornwallis at Yorktown. Very elaborate and universal preparations for the bicentennial anniversary of the birth of George Washington were

under way and the celebration of the first settlement of Maryland was to come up for 1933.

*January 18.* The 60th anniversary of the proclamation of the German empire at Versailles in 1871 was commemorated in Berlin with impressive ceremonies in the Reichstag, which was decked with many old regimental flags. There were gatherings of all veterans' associations in the Sportpalast and a march of an honor company bearing fifty regimental flags from the Franco-Prussian War. These events were attended by President von Hindenburg.

*March 4-11.* The 200th anniversary of the construction of the Spanish government's palace and the founding of the Spanish Missions was celebrated in San Antonio, Tex., beginning with blessing and dedication of the restored palace. Church, military, and civil officials present at the service included Cardinal Hayes, Gov. Ross Sterling of Texas, Maj. Gen. Edwin B. Winans, U.S.A., commanding 8th Corps Area, and Pablo de Ubarri, Spanish consul general of Galveston, representing his majesty King Alfonso XIII of Spain. Following this ceremony a colorful pageant of the arrival of the first Canary Islanders was presented. Direct descendants of the original settlers took part, including priests, Indians, soldiers, and the military governor. Later, other appropriate exercises were held, which ended with a Te Deum in the cathedral.

*March 9.* The 100th anniversary of the founding of the French Foreign Legion was celebrated in Sidi-bel-Abbes, Algeria, where the First Regiment passed in review to the blare of bands and the tunes of the Legion's famous marching songs. Colonel Rollet, who led his legionnaires on the Western Front during the World War, read the Legion's roll of honor. In Fez, Marrakech, and other outposts various regiments marched in review.

*April 14.* The date on which in 1890 the resolution creating the Pan-American Union (q.v.) was approved at the First Pan-American Conference, was observed as "Pan-American Day" by the United States and Bolivia, Chile, Costa Rica, Cuba, Ecuador, Dominican Republic, El Salvador, Guatemala, Mexico, Peru, and Venezuela. The exercises at the Pan American Union building in Washington, D. C. included addresses by the President of the United States, the Secretary of State, the Ambassadors of Mexico and Cuba, and a musical program by the U. S. Navy Band.

*April 21.* According to tradition 2684 years ago King Romulus plowed a furrow on Palatine Hill to mark the place of the walls of Rome. This date was celebrated throughout Italy with solemn ceremonies, since April 21 was declared a national holiday by the Fascist Government, which also decreed that Labor Day be celebrated on that date instead of May 1. Throughout Italy hundreds of thousands of workers paraded behind Fascist banners. As usual on this day under the Fascist régime, a number of public works were inaugurated. Some were of archaeological interest, such as the demolition of houses around the imperial forums; some were intended to beautify the city, such as the beginning of public gardens; some were of general interest, such as new schools and streets, and some were of interest chiefly to workers, as new workers' dwellings.

*April 27.* The 324th anniversary of the landing at Cape Henry of the band of pilgrims,

who planted English civilization in the New World, was celebrated by a religious ceremony conducted by Bishop Thomson of Southern Virginia, at which President Hoover and Governor Pollard were present.

*April 28.* The 100th anniversary of the granting of a charter to the New York University by the State legislature was appropriately celebrated, notably by a charter day dinner at the Hotel Astor, New York City. Governor Franklin D. Roosevelt and Dr. James Rowland Angell, president of Yale University, were among the guest speakers, and Dr. Elmer Ellsworth Brown, chancellor of the University, was the presiding officer.

*May 16.* The 100th anniversary of the founding of Gramercy Park in New York City was celebrated by a pageant in which more than 200 persons, depicting the old time costumes of a century ago, participated. There was an address by Dr. John H. Finley, and also a May pole dance for the younger generation.

*May 20.* Mecklenburg County in North Carolina celebrated the signing by Mecklenburg farmers of what is asserted to be the first formal declaration of independence from Great Britain. The date of the signing is accepted locally as May 20, 1775, although disputed by some historians. There was a parade and Gen. Charles P. Sumner, U.S.A., was the principal speaker.

*May 21.* The 50th anniversary of the founding of the American Red Cross (q.v.) was generally celebrated by local organizations throughout the United States, and conspicuously in Washington, D. C., by a banquet at which addresses were made by President Hoover and other distinguished members from home and abroad. The Post Office Department issued a commemorative postage stamp in honor of the event.

*May 24-31.* The 500th anniversary of the martyrdom of Joan of Arc was celebrated in Rouen, France. The exercises began with ceremonies in the Cathedral of Notre Dame and were followed by a military parade in which some of the famous regiments of the French army participated. It was led by groups impersonating the most glorious soldiers of France's past, thus the 1600 costumed participants were led by Gauls of Vercingetorix and included Franks of Charles Martel, soldiers of Bayard, Knights of Douguesclin, Napoleon's Guard, and, finally, heroes of the World War represented by veterans' organizations. Noteworthy were the American Legion veterans, led by Commander Sparks of the Paris Post of the American Legion.

*June 21.* The 300th anniversary of the death of Captain John Smith, the founder of the Jamestown Colony of Virginia, was celebrated in the Church of St. Sepulchre in Holborn, London, where a tablet had been placed in memory of the "Sometime Governor of Virginia and Admiral of New England."

*June 22.* The ancient city of Rochester in England celebrated its 2000 years of existence with a historical pageant in which 5000 characters recreated its old time glories. Prince George was a spectator and hundreds of American visitors, including some from Rochester, N. Y., were among those who watched the pageantry outside Rochester Castle. Chaucer's pilgrims, Queen Elizabeth, and King Charles II are all associated with the old city and many in Roches-

ter are convinced that Mr. Pickwick, immortalized by Charles Dickens, stayed at the Bull Inn.

*July 4.* The 100th anniversary of the death of James Monroe, the author of the Monroe Doctrine, was celebrated at the University of Virginia in Charlottesville, Va., with addresses and patriotic pilgrimages to historic shrines in the vicinity.

*July 29.* The 100th anniversary of the invention of the reaper by Cyrus Hall McCormick was celebrated at the Virginia Polytechnic Institute in Blacksburg, Va., by a special session at which addresses were made by Hon. Alexander Legge and former Governor E. Lee Trinkle, who described McCormick as "the great emancipator of farm labor." The McCormick family was represented by a son and two grandsons.

*July 31.* The discovery of the island of Trinidad by Columbus was celebrated at Port of Spain by an elaborate display of fireworks and other appropriate exercises.

*August 1.* The 100th anniversary of the opening of London Bridge by King William IV and Queen Adelaide was celebrated with suitable ceremonies.

*August 4.* The 75th anniversary of the founding in Rochester, N. Y., of the Western Union Telegraph Company was celebrated by gray-haired operators, many of them retired, taking prominent parts in the diamond jubilee observances in many cities throughout the United States.

*August 18.* The anniversary of the founding of the first English Colony in America by Sir Walter Raleigh was celebrated by a pageant on Roanoke Island, N. C., under the auspices of the Roanoke Colony Memorial Association.

*September 5-13.* The 150th anniversary of the founding of Los Angeles, Calif., was celebrated by a series of pageants and other exercises. Huge Mexican and Spanish shawls were draped from every trolley cross-wire and replicas of historic scenes having to do with the early days of the town swung above the intersections. The "Fiesta de Los Angeles" began with a reënactment of the ceremonies which founded the pueblo, followed by historical parades telling the story of California under four flags, the dawn of Christianity through the sacrifices of the Franciscan padres, and led up to coronation ceremonies in Olympic Stadium, and a long series of pageantry that terminated on September 13, with an international air fiesta. On Sunday morning a solemn Pontifical high mass was celebrated at the stadium, where John McCormack sang the "Ave Maria" and the Apostolic Delegate to the United States, the Most Rev. Pietro Fumasoni Biondi, officiated assisted by Archbishop Hanna and other bishops. The exercises were in part broadcasted over the radio.

*September 6.* The 150th celebration of the Battle of Groton Heights and the burning of New London, Conn., was celebrated at that place by addresses by Governor Cross and by Senator Bingham of Connecticut together with a reproduction of the Battle of Groton Heights and a naval and float parade. A deed presenting the site of Fort Griswold to the State was accepted by Governor Cross.

*September 7.* The 100th anniversary of the independence of Brazil by separation from Portugal was celebrated by a military review, including the army and navy air corps, in Rio

de Janeiro and also by patriotic ceremonies there and elsewhere throughout the entire country.

*September 10-October 3.* The 100th anniversary of the simultaneous discovery by Michael Faraday in England and by Joseph Henry in the United States that when magnets and wire coils are moved relatively to each other a steady electrical current is generated, was celebrated at the opening session of the American Physical Society in Schenectady, N. Y. on September 10 when tributes were paid to Faraday and Henry by American and British scientists. Later in London on September 21 in the Royal Institute appropriate exercises were held with an exhibition in the Royal Albert Hall, and on September 30 addresses by Prime Minister Macdonald and others were broadcasted over the world. To this discovery we owe the electric wonders of to-day—the lights that convert Broadway into a nocturnal fairyland, the electric trains that thunder in subways, the telephones and telegraphs that span continents and oceans, the central stations that send energy wherever it is wanted, and the motors that relieve labor from drudgery.

*September 12.* The 155th anniversary of the historic peace conference between Benjamin Franklin, John Adams, Edward Rutledge, and Lord Howe at the Billop House on Staten Island, in 1776 in an effort to establish peace between England and the Colonists was celebrated by a pageant. The first scene showed a seventeenth-century fair at which Captain Christopher Billop said farewell to his friends before setting sail in his sloop for the New World. Thirteen men and thirty women took part in this scene, with William Sunderman as Captain Billop. An Indian attack on the stockaded village of Oude Dorpe and Billop's arrest as a Tory were reproduced in the second episode. The conference in the Billop House 155 years ago was shown in the final episode.

*September 17.* Known as Constitution day, the 144th anniversary of the promulgation of the Constitution of the United States was celebrated by members of the patriotic societies with appropriate exercises throughout the Union.

*September 18.* The 121st anniversary of the independence of Chile was celebrated in Santiago and elsewhere in that country by patriotic exercises, notably of thanksgiving, at the termination of the recent naval meetings.

*September 23-30.* The 100th anniversary of the founding of the British Association for the Advancement of Science (q.v.) was celebrated at its centenary meeting held in London, England, under the presidency of Lt. Gen. the Right Hon J. C. Smuts, P.C., F.R.S.

*September 29.* The 20th anniversary of the first air mail in the United States was celebrated by a commemoration trip of the coast-to-coast air mail. A special post mark, authorized for Los Angeles, Calif., and Mineola, N. Y., marked the day for stamp collectors.

*October 12.* In commemoration of the discovery of America by Christopher Columbus there was dedicated on the summit of Corcovado, a high elevation in the harbor of Rio de Janeiro, a colossal figure of Christ the Redeemer, standing guard over the city. The lamps at the left of the statue were lighted by Marconi in Italy at the first illumination of this great statue.

*October 15.* The 300th anniversary of the first

Christian Church service held in Maryland was celebrated at Camp Wright on Kent Island, Md., by an outdoor service at that place when a commemorative sermon was preached by the Rt. Rev. James E. Freeman, Bishop of Washington, which was then followed by a pageant depicting a series of episodes of the Church of England on the Isle of Kent.

*October 16-19.* The 150th anniversary of the surrender of Cornwallis to Washington at Yorktown, Va., was celebrated by an elaborate series of events, including the dedication of memorial tablets to Cornwallis and de Gallatin; addresses by governors of the Thirteen Original States; a pageant depicting scenes of the history and characters of the original colonies, beginning with the landing at Jamestown in 1607 and closing with the signing of the Declaration of Independence; dedication of tablets to de Grasse and Martiau; addresses by Pershing, Pétain, and others; religious services; and terminating with exercises at which President Hoover spoke, Marshal Pétain, and other distinguished guests from France and Great Britain were present. A special commemorative stamp was issued by the Post Office Department.

*October 23.* The 100th anniversary of the founding of Lafayette College (q.v.) in Easton, Pa., was celebrated with a programme which included the unveiling of a tablet to the memory of Dr. Traill Green, former faculty member; an address by Thomas J. Watson, president of the Merchants' Club of New York; the announcement of a gift of \$50,000 from Israel P. Pardee of Hazleton as a memorial for his son; the conferring of honorary degrees; and other academic features.

*October 28.* The 155th anniversary of the battle of White Plains was celebrated at White Plains, N. Y., with an address by Jacob Gould Schurman, former Ambassador to Germany.

*November 1.* A special service commemorating the 170th anniversary of the initiation of George Washington into the Masonic Order was held at St. Paul's Episcopal Chapel, in New York City, where Washington worshipped. The services were held under the auspices of the Second Masonic District, Manhattan, and the sermon was preached by the Rev. Dr. Joseph P. McComas, vicar of the chapel.

*November 19.* The 100th anniversary of the birth of James A. Garfield was celebrated in Hiram, Ohio, by an address at Hiram College by Henry Garfield, president of Williams College, in eulogy of his distinguished father; services at the Garfield Memorial Church near the birthplace; and the placing of a boulder on the four-acre plot marking the birthplace.

*December 1-12.* The 400th anniversary of the reported miraculous appearance of the Virgin of Guadalupe, the patron saint of Mexico, was celebrated by a series of events, beginning on Dec. 1st with the restoration of the jeweled crown (valued at \$250,000) to the head of the Virgin. The number of visitors was estimated at 250,000, some of whom made the approach to the restored church on their knees, a distance of two miles.

*December 12.* The 30th anniversary of the first wireless transmission across the Atlantic Ocean from England to Newfoundland by Marconi was celebrated by a radio roll call around the world starting from New York and participated in by London, Paris, Warsaw, Berlin, Brussels,

Madrid, Ottawa, Honolulu, Tokyo, Caracas, Manila, and Rome with addresses by Marconi, Pupin, and others, and musical selections characteristic of the country from many of the stations; also, with the presentation of a gold medal to Marconi by the Veteran Wireless Operators' Association in New York City.

**MASSACHUSETTS BAY TERCENTENARY.** In April there was published a report giving the results of this great series of celebrations. It shows that in 253 towns and cities 2083 events took place and that the total attendance was 11,041,625 persons. The events are described as religious services; school exercises; pageants; parades; musical events; dedications of permanent monuments, markers and structures; historical meetings; old home weeks or days; exhibits, fairs, and expositions; and congresses, conventions, and assemblies, of each of which an account is given in the volume.

The financial report shows that for the support of the Tercentenary in its various aspects there was received from the Commonwealth of Massachusetts \$253,000; from cities and towns including committees \$500,000; from Tercentenary, Inc. \$115,000; and from conference of City and Town Committees Inc., \$35,000; making a total of \$903,000. At the close of the celebration with all bills paid, there was a surplus of \$40,000. It was therefore a financial success. According to the *Holyoke Transcript*:

In Boston they will tell you that the American Legion alone, spent in and around the city more than the entire cost of all the celebrations in the State. During the Tercentenary more than four million people came into Massachusetts, stopped in our hotels, ate our food, bought our taxed gasoline, gloried in the beauties of Massachusetts during the most perfect summer and fall season the State has ever had. Every celebration brought employment to all sorts of people. Dressmakers, shoe dealers, painters, caterers, the markets and farms, the garage and gasoline, the hotel and home businesses were all stimulated and people given extra work to take care of the tourists who helped to celebrate this great event. It served to raise Massachusetts out of the level of unemployment that might otherwise have been deeper. Perhaps it had something to do with raising Massachusetts Savings Bank investment by \$1,000,000 more than ever before.

**WASHINGTON BICENTENNIAL COMMISSION.** During 1931, the United States George Washington Bicentennial Commission continued organizing the entire nation for the nine-months world-wide celebration in 1932 of the Two Hundredth Anniversary of the Birth of George Washington. The membership of the Commission was changed by the resignation of Lieut. Col. U. S. Grant, 3d, as associate director, and the death of Nicholas Longworth, Speaker of the House of Representatives. Colonel Grant's resignation left Congressman Sol Bloom of New York as the executive officer in charge, and the place held by Speaker Longworth was filled by the new Speaker. The office personnel of the Commission was increased to handle the great volume of correspondence, research work, and keeping city and state commissions abreast of the general activities. This was all cared for under divisions as follows:

*Division of Information and Publication.* This division continued to publicize the country in preparation for the Celebration. The success of the event depending largely on the "Washington-mindedness" of the country, considerable effort was taken in this direction. Newspapers and magazines in every State and city devoted columns to the Celebration and historical articles

telling of George Washington and his times. An additional activity was the distribution of 1,000,000 portrait-posters of George Washington to the schools of America. Another poster, "The Dawn of American Liberty," was sent to all post offices in the nation. Broadcasting of radio announcements was also part of the activity of this Division.

**Organisation Division.** The act creating the United States George Washington Bicentennial Commission, called for the appointment of Bicentennial commissions in each State. This has been accomplished under the supervision of this division, and these Commissions have a personnel of more than 1400. In addition to commissions in the States, Bicentennial organizations existed in the District of Columbia, Alaska, and in the Virgin Islands, the Philippines, Porto Rico, Hawaii, and the Canal Zone. The ultimate aim was to have a committee in every town and city in the United States to prepare programmes of various sorts. More than 16,000 city and town committees have been appointed. Besides these organizations, Bicentennial commissions were formed among churches and fraternal organizations, thus providing direct contact between the Commission and some 90,000,000 members of these groups.

**Women's Division.** Through this division the units of national organization of women have received information concerning the purpose, aim, and scope of the Commission. These organizations extend to every State in the Union as well as to the territories, and represent a membership of over twenty-five million women. Twelve George Washington programmes and forty-eight historical papers on topics in the programmes, have been prepared and published by the Commission, which depict the life, character, and achievements of George Washington from the time of his birth in Wakefield to the end at Mount Vernon.

**Educational Division.** The first aim of this division was to develop a consciousness of the purpose, aim, and scope of the Celebration in the minds of the school children and teachers of the United States. This was done by correspondence and representation at the national meetings of the educational forces. Letters and material were sent to the president of every normal school, junior college, teachers' college, senior college, and university in the nation, asking cooperation in the Celebration. Similar information was sent to all State Departments of Education and to every county superintendent. To supply the teachers with a background of the Bicentennial activities and authentic information of George Washington, a handbook was prepared as a suggestive guide to an appreciation course designed by the Commission, which dealt with the life and achievements of George Washington and the history of the creative period in which he lived. Opening new avenues of participation and expression in the Celebration are the declamatory, essay, and oratorical contests which will be carried on in all the schools. These were to be under the supervision of the various State Bicentennial Commissions, and the Washington commemorative medal was to be presented by the National Commission to the State winners.

**Historical Division.** The Historical Division was engaged in the publication of a series of sixteen pamphlets, "Honor to George Wash-

ington," which has been prepared by a group of eminent scholars on the various phases of George Washington's life. In addition to this work the Division serves as a clearing house for inquiries for historical information of Washington and his times.

**Play and Pageant Department.** This department has supervised the preparation of more than thirty plays and pageants of varied character suitable for presentation under different conditions and adapted to the use of schools, churches, and organizations in general. The themes of these dramatic productions cover a wide range from the boyhood days of Washington to his retirement to Mount Vernon after his second term as President of the United States. Percy MacKaye, writer and dramatist, was commissioned to prepare the folk-masque, *Wakefield*, which was to be presented in all the large cities of the United States during the Celebration. A catalogue of all available plays and pageants dealing with the life of Washington was issued by the department. *How to Produce a Pageant in Honor of George Washington*, and a booklet on the costumes suitable for Washington plays and pageants, also were prepared by this department.

**Music Division.** This Division assembled all facts regarding the music of Washington's time, songs, and pieces written specifically in honor of Washington, and American music and works from abroad which were known and played in the eighteenth century. All music publishers were invited to send to the Commission copies of music in their catalogues suitable to George Washington celebrations and programmes—either historic music in modern editions, or contemporary music commemorating Washington, or otherwise suitable for use in Bicentennial programmes. This research was made available in a booklet entitled *The Music of George Washington's Time*. The Commission also published a collection of eighteenth-century songs and piano pieces which were selected with the cooperation of the Music Division of the Library of Congress. Three American composers were commissioned to contribute musical compositions to the Celebration: John Alden Carpenter who wrote a choral ode, *Song of His Children*; John Philip Sousa who wrote the *George Washington Bicentennial March*, and George M. Cohan who contributed the song, *Father of the Land We Love*.

**Foreign Participation.** Assistance was given to foreign diplomatic representatives in planning the participation of their governments in the Celebration. Bicentennial committees of Americans were organized in foreign countries and were assisted in planning their part in the Celebration. This department also was instrumental in organizing all foreign language groups in the United States for the Bicentennial.

**Miscellaneous.** A number of special activities were carried on by the Bicentennial Commission throughout the year in the interest of the Celebration. One of these was the collection of photographs of Washington portraits and paintings by eminent artists, contemporary with Washington and later, which were being used to illustrate publications and various articles and stories in connection with the Bicentennial Celebration. This is the largest and finest collection of such Washington pictures ever made. A National Historical Loan Exhibition of life por-

traits of Washington and their replicas, together with other Washingtoniana, was to be shown for the first time in the Nation's Capital in 1932 under the direction of the Bicentennial Commission. The Commission had sponsored the production of a motion-picture epic of George Washington's life which was filmed by the Eastman Teaching Films Company. This picture will be appropriate for use by schools and organizations in general, and may be shown in large or small auditoriums. The Bicentennial Commission cooperated with various governmental departments in carrying out features of the Celebration. Such was the case in a series of memorial postage stamps and stamped envelopes issued by the Post Office Department, depicting George Washington at different times in his life. A special act of Congress authorized the issuance of a George Washington quarter dollar to replace the present coin of that denomination. An official Bicentennial medal was prepared as an award to winners of various contests during the Celebration. The coin and the medal were prepared by the Treasury Department with the cooperation of the Bicentennial Commission. The participation of the young people of the Nation in the celebration was being furthered by the work being done with various junior organizations such as the Scout groups and 4-H Clubs, Camp Fire Girls, Junior Red Cross, and similar groups. In the Braille Department of the Bicentennial Commission the government established for the first time a department for the blind. George Washington material and suggestions were being set in Braille so that those without sight might have an equal share with the sighted in the Celebration.

A model library exhibit of Washingtoniana was prepared and photographed. The pictures were to be sent to public and school libraries in the United States to furnish a pattern for similar exhibits during 1932. The Commission also distributed Washington literature and material among the libraries of the country and planned to publish a Washington bibliography

civic, social, fraternal, and other groups throughout the United States. A pamphlet was published to revive interest in the planting of colonial gardens; a short history was compiled of eighteenth century business firms in existence to-day; moving picture and radio broadcasting companies also benefited by the cooperation of the Commission—in short, every means by which a great nation might show its appreciation for its founder was adopted.

**MARYLAND TERCENTENNIAL CELEBRATION.** A commission appointed by Governor Ritchie, of which William L. Marbury was made chairman, had already begun the study of plans, and active preparations for the celebration of this event were under way.

**CELL.** See ZOOLOGY.

**CELTIC LITERATURE.** See PHILOLOGY, MODERN.

**CEMENT.** The preliminary estimates of production for the Portland cement industry in the United States, compiled by the U. S. Bureau of Mines, showed a decrease of 22.7 per cent in production and 20.5 per cent in shipments from the totals for 1930, and the total production of 1931 was estimated at 124,594,000 barrels as against 161,197,000 barrels in 1930, and the shipments from mills in 1931 amounted to 126,465,000 barrels with an estimated factory value of \$139,381,000 as compared with 159,059,000 barrels shipped in 1930. During the calendar year 1931 the production related to capacity was 46.5 per cent as against 61.5 per cent in 1930. In addition to Portland cement, the production of clinker (unground Portland cement) in 1931 was 121,814,000 barrels as against 160,992,000 barrels in 1930.

The exports of hydraulic cement from the United States in 1930 aggregated 755,778 barrels valued at \$2,454,515 while the imports in the same year were 977,997 barrels valued at \$1,140,929. In 1931 the exports of cement amounted to 429,653 barrels valued at \$1,220,600 and the imports amounted to 457,944 barrels valued at \$507,918.

ESTIMATES OF PRODUCTION AND SHIPMENT OF UNFINISHED PORTLAND CEMENT BY DISTRICTS  
[Quantities in thousands of barrels]

(U. S. Bureau of Mines, Revised Jan. 18, 1932)

Districts	Production		Shipments		
	1931	1930	1931	Estimated value, 1931	1930
Eastern Pennsylvania, New Jersey and Maryland . . . . .	28,360	35,141	28,596	\$29,725,000	35,857

which was compiled by the American Library Association. The Commission has also extended assistance to merchants and manufacturers in general in the production and sale of articles of the Bicentennial year. Through the cooperation of the Commission with the American Tree Association more than 18,000,000 George Washington trees were planted by schools and various

**CENSUS.** The Bureau of the Census during the year continued the work of compiling, publishing, and distributing the various reports of the Fifteenth Census of the United States. Through the improved and permanent organization of the Bureau, it was possible to advance the publication dates on all phases of census work, so that in addition to the preliminary reports of the

decennial census, which were published in 1930 and 1931 as fast as they were available, the complete returns were brought out in final form for a number of the divisions, and the current bulletins were issued regularly. Thus, Volume I of the Fifteenth Census, giving the number and distribution of inhabitants, was printed and distributed 13 months after the canvass started as compared with 20 months required for the publication of a similar volume at the 1920 Census. The Division of Manufactures completed its preliminary release for industry within the year 1930 in place of the following year, which had been usual in previous censuses. Publication dates were advanced in all phases of the Census work notwithstanding the increased number of inquiries on the various schedules and the fact that the censuses of distribution and unemployment had been added.

At the close of the fiscal year, June 30, 1931, more than 50 per cent of individual State population and agricultural reports had been printed and distributed, these reports including the following topics: Number and distribution of inhabitants, composition and characteristics of the population, unemployment, and agriculture—two series, one presenting information by minor civil divisions and the other by counties. The Distribution Division completed its series of press releases giving retail trade statistics for towns of 10,000 or more populations and wholesale trade statistics for cities of 100,000 or more, and made considerable progress during the year on its State and Merchandise reports. The Division of Manufactures completed its preliminary summaries for the States and was issuing printed industry reports.

The work of the Census Bureau on vital statistics was improved by the addition of the State of South Dakota to the registration area for deaths, so that 47 States, the District of Columbia, the Territory of Hawaii, the Virgin Islands, and eight cities in the remaining non-registration State of Texas were included; in all, 96.2 per cent of the total population of the United States was represented in the area for death registration. The birth registration area included 46 States, the District of Columbia, and the insular possessions, Hawaii and the Virgin Islands, or about 95 per cent of the total population. Marriage and divorce statistics were published each year by States, and statistics on institutions, State and city government, and special industries were compiled annually.

The Census Bureau was engaged in publishing an elaborate series of population figures which include compilations for metropolitan areas and statistics on families. Part of the statistics on families are being presented in a series of State bulletins and the remainder in a series of subject bulletins. The State bulletins give the number of families by counties with figures for all incorporated places having 2500 inhabitants or more and showed the number of families classified by size, color, nativity of head, and according to the number in the family under ten years of age. In addition, there are given the number of dwellings classified as one-family, two-family, and three-or-more family and the number of owned homes classified according to value and the number of rented homes classified according to monthly rental. The families are also classified according to the number of children under 21; according to the number of gainful workers, and

according to the number of lodgers. The home-makers are classified according to their employment status, first, those who have no gainful occupation, and second, those who have an occupation which takes them away from home. The latter classification is divided into several groups, such as professional workers, office workers, and industrial workers.

At the end of the year the Census Bureau had ready for distribution the final reports on the composition and the character of the population consisting of two quarto volumes containing about 1400 pages. The volumes consisted of the bulletins for the individual States previously printed, while the opening chapter of the first volume is a summary of the United States of unusual statistical value. It contained the composition and characteristics of the population of the United States based on color, nativity, and parentage, sex, citizenship of the foreign born, age, school attendance, illiteracy, marital condition, country of birth of the foreign born, country of origin for foreign white stock, and gainful workers by industry groups.

In addition to the U. S. Census, there was considerable census activity during the year in other countries. The Dominion of Canada took a census of population on June 1st and the preliminary reports were available during the latter part of the year. (See CANADA.) Italy took a census of population from April 21, while Great Britain, on April 27, took its census of population. Provisional reports were available for the population of England, Scotland, and Wales. (See GREAT BRITAIN.) France in March had a census of population and provisional returns were announced before the end of the year. (See FRANCE.) Poland took its second census in December, 1931, which as expected showed a heavy increase in population over the 30,000,000 in 1925. India took a census in 1931, as did the Union of South Africa and Cuba.

Besides the population censuses taken in India, Canada, and South Africa, official counts were made also of the number of inhabitants in Palestine, Nigeria, and most of the colonies and protectorates of the British Commonwealth of Nations. Results of a number of these censuses were made public, in preliminary form, toward the close of 1931. The censuses taken during 1930 and 1931 showed a rapid growth of population in Italy, Poland, and Japan, while in more highly organized countries such as Great Britain and France the population was almost stationary, with the prospect of continued future declines. The Governments of Brazil and Germany also authorized the compilation of censuses of industry during 1931.

The results of these various censuses so far as announced when the YEAR BOOK went to press are given in the articles on the various countries. For Farm Statistics see AGRICULTURE and sections on *Agriculture* or *Crops* under the UNITED STATES and articles on the separate States and countries.

POPULATION OF CITIES AND TOWNS IN THE UNITED STATES. The corrected statistics of population for cities, towns, and boroughs, in the United States of 3000 or more inhabitants by States, as enumerated by the U. S. Census Bureau in 1930, are given in the tabulation on the following pages. With the population statistics for 1930, are given those for 1920 for the purpose of comparison, and where a \* follows the name, the population of the township is indicated.

**CENTRAL AMERICA.** The term generally applied to the southern portion of the North American continent lying to the north of the

Panama Canal and south of the Isthmus of Tehuantepec in southern Mexico and consisting of the five states, Costa Rica, Guatemala, Hon-

duras, Nicaragua, and Salvador, and the British crown colony of British Honduras. See the articles on these respective countries; also EXPLORATION; ANTHROPOLOGY.

**CENTRAL ASIA.** See SOVIET CENTRAL ASIA.

**CENTRAL AUSTRALIA.** See NORTHERN TERRITORY.

**CENTRAL STATIONS.** See BOILERS; DYNAMO ELECTRIC MACHINERY; POWER PLANTS, STEAM.

**CEREALS.** See BARLEY; OATS; RYE; WHEAT; ZOOLOGY.

**CERMAK, ANTON J., MAYOR OF CHICAGO.** See ILLINOIS.

**CEYLON, sé-lôn'.** An island crown colony of Great Britain off the southern tip of India, occupied in turn by the Portuguese and Dutch previous to its annexation by the British in 1796. Capital, Colombo.

**AREA AND POPULATION.** With an area of 25,332 square miles, Ceylon had a census population of 4,497,854 in 1921 and an estimated total of 5,479,000 on Jan. 1, 1930. Registered births in 1929 numbered 198,007; deaths, 135,277; marriages, 28,916 (exclusive of Moslem marriages). In 1921, there were 8099 Europeans; 29,403 burghers, or Dutch descendants, and other Eurasians; and the remainder of the population comprised Sinhalese, Tamils, Moors, Malays, Veddas, and others. Buddhism is the religion of the majority. The estimated population of the chief cities in 1929 was: Colombo, 267,700; Jaffna, 44,160; Galle, 39,800; Kandy, 34,910. Education is free in the vernacular schools; attendance in primary schools in 1929 was 562,550.

**PRODUCTION.** Ceylon is primarily agricultural, with about 3,200,000 acres devoted to the cultivation of rubber, tea, rice, cacao, tobacco, coconuts, spices, areca nuts, and sugar cane. About half of the population's rice needs is imported. Livestock in 1929 included 1,650,000 cattle, 57,000 sheep, 45,000 swine, 1000 tamed elephants, and 2000 horses. A total of 81 plumbago mines were in operation in 1929 and some monazite and small-pem deposits are exploited. Manufacturing is confined to the production of such agricultural commodities as coconut oil, cacao, rubber, etc.

**COMMERCE.** Foreign trade experienced a marked decline in 1930. General imports were valued at 302,130,000 rupees (about \$108,760,000), as against 403,000,000 rupees (\$147,096,000) in 1929. Domestic exports totaled 292,030,000 rupees (about \$106,811,000), compared with 379,564,000 rupees (\$138,541,000) in the previous year. Imports are principally from Great Britain and India and exports go chiefly to Great Britain and to the United States, the latter country taking about one-fifth of the total. The United Kingdom in 1930 took £13,517,734 of the exports and furnished £8,998,702 of the imports.

**FINANCE.** After showing a steady increase from 1920-21 to 1927-28, Government revenue and expenditure declined sharply in 1928-29. Exclusive of railway earnings and expenses, revenue in 1928-29 totaled £7,187,885 and expenditure £8,393,069, compared with £8,942,330 and £10,140,480, respectively, in 1927-28 (one pound sterling equals 15 rupees). The net public debt on Sept. 30, 1928, was £12,644,193 and 3,000,000 rupees, or a total of about \$62,532,000. The unit of currency is the silver rupee of British India, with a par value of \$0.3649.

**COMMUNICATIONS.** Ceylon had 951 miles of railway in 1929 and (in 1930) a total of 15,911

miles of highways, of which 4909 miles were macadam. Shipping entered and cleared in 1929 totaled 24,466,389 tons (22,725,000 tons in 1928).

**GOVERNMENT.** The administration of the island is in the hands of a governor, assisted by an executive council of nine ex-officio and nominated members, and a legislative council of 61 members, of whom 50 are elected. The colony is divided into nine Provinces, each administered by a Government Agent. A new Constitution, increasing the powers of the Legislative Council, was adopted in 1930 and in June, 1931, was held the first general election in which universal adult suffrage was substituted for the former property and educational suffrage tests. Sir Graeme Thomson, the Governor, assumed office Mar. 1, 1931.

**MALDIV ARCHIPELAGO.** The Maldiv Archipelago consists of 13 coral islets, 400 miles southwest of Ceylon. Inhabited by 70,000 Moslems (1921 census), they are ruled by a native sultan and pay an annual tribute to the Ceylon government. Millet, fruits, and edible nuts are the chief products.

**CHACO DISPUTE.** See BOLIVIA under *History*.

**CHAD.** See FRENCH EQUATORIAL AFRICA.

**CHADBOURNE AGREEMENT.** See SUGAR.

**CHADWICK, GEORGE WHITEFIELD.** An American composer, died in Boston, Mass., Apr. 4, 1931. He was born in Lowell, Mass., Nov. 13, 1854, and studied under Jadassohn and Reinecke in Leipzig and under Rheinberger in Munich. In 1880 he became organist in the South Congregational Church, Boston, and instructor in harmony, composition, and instrumentation in the New England Conservatory of Music. In 1897 he was made director of the conservatory, which position he held until his retirement in 1931. For several seasons he also was conductor of the Springfield and Worcester festivals. He was a member of the American Academy of Arts and Letters, receiving in 1928 the gold medal awarded annually by the National Institute of Arts and Letters "for the most distinguished contribution to music during the year." Compositions, which were distinguished for their treatment of thematic material, include for orchestra—three symphonies in C major, B flat, and F; six overtures, *Rip van Winkle*, *Thalia*, *The Miller's Daughter*, *Metempsychosis*, *Adonax*, *Euterpe*; Serenade in F; Suite in A; Sinfonietta; for chorus with orchestra—*The Viking's Last Voyage*, *The Pilgrim's Hymn*, *Lovely Rosabelle*, *Phoenix Epirians*, *The Lily-Nymph*, and *Dedication Ode for the World's Columbian Exposition*; chamber music—six string quartets, a piano quintet, and a string trio. His most ambitious work was the lyric drama, *Judith*, which was performed in Worcester in 1900. He also composed two comic operas, *Tabasco* and *The Quiet Lodging*, and in 1911 wrote the incidental music for the morality play *Everywoman*. In addition, he wrote upwards of 50 songs and compositions for the piano and organ.

**CHAMBER OF COMMERCE OF THE UNITED STATES.** A national federation of more than 1500 business organizations, established in 1912 primarily as a vehicle for the expression of national business opinion on important economic questions.

The members of the chamber are trade associations and local or regional chambers of commerce,

these groups being represented on a board of directors, composed of 34 members chosen from geographical districts or specific fields of business and elected for a term of two years. The membership in 1931 consisted of 1515 business organizations, 5713 individual members, and 4351 associate members. The policies of the organization are formulated only by resolutions adopted at its meetings or by direct referendum, in order that they may reflect as accurately as possible the opinion of all classes of business represented in the constituent membership. Among the questions to which the chamber is currently directing its attention are: Agriculture and agricultural credit; banking; commercial policies in foreign relations; distribution efficiency; government competition; government expenditures and taxation—Federal, State, and local; natural resource industries; stabilization of business and employment; trade and commercial organization; trade relations; transportation; immigration; realty financing; Federal reserve system; special insurance taxes; fire prevention; employees' retirement annuities; public and private employment exchanges; water power policies; and commercial forestry.

For the convenience of its members the chamber maintains at its national headquarters 12 service departments, covering the main divisions of business activity. The agricultural department aids local chambers of commerce in the solution of agricultural problems and the enhancement of trade-area prosperity. The civic development department aids business men to approve not only local municipal and civic development but also matters of general national importance. The commercial organization department assists member chambers in strengthening their organization and extending their usefulness to the communities which they serve. The department of manufacture assists local chambers with their problems of industrial extension. The domestic distribution department promotes better methods of distribution. The finance department studies methods of Federal, State, and local taxation and problems of corporation and international finance. The foreign commerce department deals with tariff policies and import and export problems. The insurance department works to secure a more enlightened public attitude toward the insurance institution. The natural resources production department deals with the problems of water power, oil, coal, forest, and other natural resources. The trade association department serves as a clearing house as to the activities which a trade association can carry out most effectively. The transportation and communication department studies problems of rail, highway, waterway, and air transportation and of postal service and electrical communications. The research department covers the general field of economic research. The chamber also publishes a monthly magazine, *The Nation's Business*, and issues from time to time carefully compiled reports on economic subjects for the use of its members.

The nineteenth annual meeting of the chamber was held in Atlantic City, N. J., April 28 to May 1, 1931. The officers elected for 1931-32 were: President, Silas H. Strawn, Chicago; chairman of the board, Julius H. Barnes, New York City; honorary vice president, Seymour Parker Gilbert, New York City; honorary life vice president, John Joy Edson, Washington; vice

presidents, A. J. Brosseau, New York City, W. Rufus Abbott, Chicago, Junius P. Fishburn, Roanoke, Va., John G. Lonsdale, St. Louis, Karl DeLaittre, Minneapolis, Paul Shoup, San Francisco; treasurer, Oscar Wells, Birmingham; secretary, D. A. Skinner, Washington. National headquarters are in Washington, with divisional headquarters in New York City, Atlanta, Chicago, Minneapolis, Dallas, and San Francisco. See **UNEMPLOYMENT**.

**CHANNING, EDWARD.** An American educator and historian, died in Cambridge, Mass., Jan. 7, 1931. He was born in Dorchester, Mass., June 15, 1856, and was graduated from Harvard University, receiving the A.B. degree in 1878 and the Ph.D. degree in 1880. He became instructor in history at Harvard in 1883, assistant professor in 1887, professor in 1897, and McLean professor of ancient and modern history in 1913. In 1929 he retired as professor emeritus. He wrote *Town and County Government in the English Colonies of North America* (1884); *The Narragansett Planters* (1886); *The United States of America* (in the Cambridge History Series, 1896); *Student's History of the United States* (1898); and *First Lessons in United States History* (1903). He also collaborated with Justin Winsor in vols. ii, vi, and vii of the *Narrative and Critical History of America* (1886-88), with Thomas Wentworth Higginson in *English History for Americans* (1893), and with A. B. Hart in the *Guide to the Study of American History* (1896). His magnum opus was a comprehensive history of the United States in eight volumes, of which six had been published at the time of his death. These included *The Planting of a Nation in the New World, 1000-1660* (1905); *A Century of Colonial History, 1660-1760* (1908); *The American Revolution, 1761-1789* (1912); *Federalists and Republicans, 1789-1815* (1917); *The Period of Transition, 1815-1848* (1921); and *The War for Southern Independence* (1925). To the latter volume was awarded the 1925 Pulitzer Prize as the best book of the year on American history.

**CHARLES, THE VEN. ROBERT HENRY.** A British theologian and author, died in London, Jan. 30, 1931. He was born in County Tyrone, Ireland, Aug. 6, 1855, and was educated at Queen's College, Belfast; Trinity College, Dublin; and Queen's University. On ordination in 1883 in the Church of England, he became curate of St. Mark's, Whitechapel, being called to St. Philip's, Kensington, in 1885 and to St. Mark's, Kennington, in 1886. In 1898 he became professor of Biblical Greek at Trinity College, Dublin, and from 1905 to 1911 was Grinfield lecturer on the Septuagint at Oxford and from 1910 to 1914, Speaker's lecturer in Biblical Studies. He was made a canon of Westminster Abbey in 1913, and the same year was appointed lecturer in advanced theology at London University.

In 1919 he became archdeacon of Westminster, and from that date was Warburton lecturer in Lincoln's Inn Chapel. He received the first award of the British Academy's Medal for Biblical Studies. His special field was the Apocrypha, in which he was recognized as a master not only of the languages but of the spirit that domi-

nated the Apocryphal age. His important works are *Book of Enoch* (trans. from the Ethiopic, 1893, 2d ed., 1912); *Apocalypse of Baruch* (trans. from the Syriac, 1896); *The Doctrine of a Future Life* (Jowett Lectures, 1898-99); *The Testaments of the XII Patriarchs* (trans. from the Greek, 1908); *The Zadokite Fragments* (trans. from the Hebrew, 1912); *Studies in the Apocalypse* (1913); *Religious Development Between the Old and the New Testament* (1914); *The Chronicle of John of Nikiu* (trans. from the Ethiopic, 1916); *The Apocalypse* (edited with text, translation, and commentary, 2 vols., 1920); *Lectures on the Apocalypse* (Schweich Lectures, 1919, 1922); *The Decalogue* (Warburton Lectures, 1924); and *Critical Commentary on the Book of Daniel* (1929). He was also general editor of and contributor to the Oxford edition of the *Apocrypha and Pseudepigrapha* (2 vols., 1913).

**CHARTERS, CITY.** See MUNICIPAL GOVERNMENT.

**CHAUTAUQUA INSTITUTION.** An educational movement established in Chautauqua, N. Y., in 1874 by Lewis Miller and the Rev. Dr. John H. Vincent, both prominent in the Methodist Episcopal Church. Its original idea was that of an assembly for Sunday-school teachers, but it was gradually developed into an institution affording during the months of June, July, and August a series of correlated lectures and entertainments. The three general fields of activity are the general assembly, consisting of an educational and popular series of lectures and addresses, concerts, operas, dramatic entertainments, and so forth; the summer schools, offering credit courses under the direction of New York University; and a home-reading circle, in which five outstanding books are designated for reading during the year, in addition to a news narrative appearing in a monthly review.

The attendance at the annual session in 1931 was within 7 per cent of the estimated attendance of 45,000 in 1930. On the platform at the general assembly were: Rear Admiral Richard E. Byrd, U. S. N.; Toyohiko Kagawa, Japanese author and philanthropist; Henry Goddard Leach, American editor; the Rev. Charles Stelzle, American author and sociologist; John Philip Sousa, band master and composer; and Ernest Hutcheson, American pianist. Ten performances of five operas were given in English under the direction of Albert Stoessel and others prominent in the Juilliard Graduate School of Music. There were also ten performances of five plays given by the Repertory Theatre, made up of members of the Cleveland Play House company. The summer school included 18 departments, with 100 instructors and approximately 1500 students. The officers in 1931 were: George E. Vincent, honorary president; Arthur E. Bestor, president; William L. Ransom, chairman of trustees; Shailer Mathews, chairman of the executive board; Charles E. Peirce, secretary; and Jessie M. Leslie, treasurer.

**CHEESE.** See DAIRYING.

**CHEMICAL INDUSTRY, SOCIETY OF.** See CHEMISTRY, INDUSTRIAL.

**CHEMICAL SOCIETY, AMERICAN.** See CHEMISTRY, INDUSTRIAL.

**CHEMISTRY.** The announcement from two different American sources of the discovery of the missing element 87, sometimes called Ekace-

sium, is of the highest importance, for if confirmed, it leaves No. 85 in the Mendeleff classification as the only remaining undiscovered element. The results of further investigations in the constitution of the atom are of the greatest interest. Also worthy of high regard is the persistent study of the constitution and the properties of the gland fluids of animals, which more and more are adding to our knowledge of the beginnings of life from a chemical point of view.

The results of other valuable researches are also given in the paragraphs that follow.

**NEW ELEMENTS.** According to an Associated Press dispatch from Washington, dated January 29, proof of the identity of "rhenium," one of the "missing" elements of which science suspected the existence, had been discovered and checked at the U. S. Bureau of Standards. Dr. W. F. Meggers, a specialist in optical work, brought out the proof of the presence of the element by application of the X-ray and the analysis of the special light it reflects. The substance had been provisionally set down as "rhenium 75" on the list of ninety-two basic elements making up the universe, though its discovery had only been predicted from the results of certain experiments.

An Associated Press dispatch from Auburn, Ala., dated May 9, related that Dr. Fred Allison, professor of physics in Alabama Polytechnic Institute, announced the discovery of evidence indicating that element "85," last of the 92 recognized elements undiscovered, exists in sea water, fluorite, apatite, monazite sand (Brazilian), kainite, potassium bromide, hydrofluoric acid, and hydrochromic acid. Dr. Allison's announcement followed after a year of research in which he was assisted by Edgar J. Murphy, a former assistant instructor in physics, and Dr. Anna L. Sommer, and Edna R. Bishop, chemists for the agricultural experiment station of the college. Through the magneto-optic method, Dr. Allison said he had been able to detect one part of a substance in one hundred billion. He said element "85" appeared to exist in exceedingly minute traces, about one part in one billion being the greatest concentration found in any of the substances he studied. Dr. Allison said that traces he obtained constitute "a high order of probability" that the last of the elements had been found.

Also a further Associated Press dispatch from New York announced on October 16, that a new substance, the missing element No. 87, had been found. Positive identification of this substance in samarskite, a lustrous black mineral, was announced by Cornell University. The discovery was made by Jacob Papish, professor of spectroscopy. He obtained from the samarskite, a sulphate which is a mixture, and in this identified by the aid of the spectroscope the number 87. The small amount of 87-bearing material in his laboratory is believed to be priceless, with a theoretical value exceeding radium. The new element had not been isolated. If it were separated with present facilities it probably would burn up. Prof. Louis M. Dennis, head of the department of chemistry at Cornell, said of Papish's work: "The finding of element 87 is one of the greatest scientific discoveries of our time."

On October 28 came a dispatch from Cheyenne, Wyo., saying that Hugo Reinhold, a Los Angeles mineralogist, announced the discovery in South-eastern Wyoming of deposits of samarskite con-

taining "missing element No. 87," the identification of which had been made public at Cornell University.

At a meeting of the Third International Radiology Congress held in the Sorbonne in Paris in June, Jules Stoklasa, director of the State Experimental Station in Prague, said: "Protactinium had been recently isolated by a Russian scientist, Aristid Grosse, from the residue of products used in obtaining uranium and radium. The effects of alpha, beta, and gamma rays from protactinium, were considerably more intense than those from radium. He asserted the new element would prove more effective than radium in the treatment of diseases, and that protactinium also could be used to increase farm crops."

**ATOMIC WEIGHTS.** Work on the redetermination of these important factors continued, notably by the eminent German chemist O. Hönigschmidt and his pupils. Very early in the year the suggestion by A. von Grosse was published (*Zeit. Phys. Chem.*, vol. 10, p. 395) that helium should be employed as the basis of the atomic weight system. The importance of the helium nucleus in atomic structure, and the fact that the difference between the atomic weights of atoms containing an integral number of alpha particles with the next integer represents the energy of formation of the atom from alpha particles, were adduced in favor of the proposal. Among the redeterminations of atomic weights since last year may be mentioned that of potassium, which according to O. Lowry (*Journ. Amer. Chem. Soc.*, vol. 52, p. 4332) as made from cotton ash and wheat flour ash yielded  $39.111 \pm 0.013$  and  $39.091 \pm 0.016$ , which is in good accordance with the accepted value. According to O. Hönigschmidt and H. Striebel (*Zeit. Anorg. Chem.*, vol. 194, p. 293) analysis of thallous bromide by precipitation of silver bromide yielded for the atomic weight of thallium  $204.390 \pm 0.008$ . P. Hartert and H. Striebel reported the atomic weight of bromine, obtained by fractionally subliming bromine in a current of hydrogen at  $-18.5^\circ$ — $-25^\circ$  and  $-30^\circ$ , yielded a result of  $79.916 \pm 0.001$ .

According to G. P. Baxter and A. D. Bliss (*Jour. Amer. Chem. Soc.*, vol. 52, p. 4851) the atomic weight of lead from uranite is found to be 206.195. The same authors (*Jour. Amer. Chem. Soc.*, vol. 52, p. 4848) reported the atomic weight of uranium lead extracted from Swedish Kolm as 206.01. The atomic weight of sulphur according to O. Hönigschmidt and R. Sachtleber (*Zeit. Anorg. Chem.*, vol. 195, p. 207) is 32.0664, obtained by the direct combination of silver and sulphur vapor at  $250^\circ$ . O. Hönigschmidt and K. Kempter (*Zeit. Anorg. Chem.*, vol. 195, p. 1) reported the value of  $40.085 \pm 0.00060$  as the atomic weight of calcium.

In their study for the determination of the ratio of ammonia to silver G. P. Baxter and C. H. Greene (*Jour. Amer. Chem. Soc.*, vol. 53, p. 604) found that the ratio  $\text{Ag}:\text{NH}_3$  was 0.33420, hence the ratio  $\text{NO}_3:\text{NH}_3$  is 3.64083 and the atomic weights of nitrogen and silver are 14.0078 and 107.879 respectively. According to the results obtained by F. W. Ashton (*Nature*, vol. 127, p. 813) the atomic weight of cesium should be  $132.91 \pm 0.02$ .

**ANALYTICAL CHEMISTRY.** Chemistry is only analysis and synthesis, for without a knowledge of the composition of a substance it is impossible

to build up a new compound having desired properties. It is therefore that new methods of analysis and new forms of apparatus are constantly reported.

It was found by J. V. Tamechyna that molybdic acid gives a violet coloration with potassium cetyl-xanthate when diluted not exceeding 1:4,000,000. The presence of excess of tungsten does not interfere with this reaction which, however, can not be applied in the presence of copper, iron, nickel, or bismuth. It was found by L. Rosenthaler (*Apoth. Zeit.* vol. 45, p. 638) that for limiting concentrations in micro-precipitation of alkaloids, sodium alizarinsulphonate is useful, and is specially suitable for the detection of atropine. For the rapid determination of iron A. M. Malkor (*Journ. Chem. Ind. Moscow*, vol. 8, p. 70) finds that when 40cc of Fehling solution are boiled with 20cc of 1 per cent dextrose solution, and the precipitate of cuprous oxide is dissolved in a solution of the iron containing substance under analysis in concentrated sulphuric acid, the ferrous sulphate content of the solution is then determined by titration with standard permanganate.

In working out a new method for the rapid determination of solid saturated fatty acids T. P. Hilditch and J. Priestman (*Analyst*, vol. 56, p. 354) modified Bertram's method by oxidizing the soap with alkaline  $\text{KMnO}_4$  at  $35$ – $50^\circ\text{C}$  or oxidizing free fats with  $\text{COMn}$  with anhydrous  $\text{KMnO}_4$ . For rapid work these authors recommend the use of a parallel determination by an improved form of the Twitchell process, which by itself, however, may give misleading results. A modification of the Engler distillation flask is described by W. Swientoslowski (*Rocz. Chem.*, vol. 11, p. 453) as follows: The vapors from the distillation flask enter the middle part of the condenser, instead of at the bottom; in this manner partial evaporation of the condensate by the hot vapors is avoided. T. Ruemele (*Zeit. Anal. Chem.*, vol. 84, p. 81) is the author of a critical study of the methods for a colorimetric determination of tryptophan. Accurate results he found were obtained by adherence to standardized conditions. Not more than 2 drops of a 2 per cent  $\text{CH}_3\text{O}$  should be used and 45 minutes should elapse after this has been added before comparison of the colors is made.

**BIOLOGICAL CHEMISTRY.** Again, analysis and synthesis. Without diagnosis, a knowledge of symptoms of conditions, it would be impossible to prescribe a cure. The value of insulin in diabetic conditions might not have become known unless the fact that the need of such a combination was essential, had been previously determined. An interesting item of progress appeared as a press dispatch in the *New York Times* of September 11. It stated that: "Much hope for the development of powerful poisons which will kill disease organisms in the human body without injury to the patient has been reported by three staff members of the University of California Hooper Foundation for Medical Research. The three workers, Prof. Ernest L. Walker, Dr. Marion A. Sweeney, and Dr. Benjamin L. Freeland, report that they have found it possible to so manipulate a chemical molecule built up from the benzene ring of carbon and hydrogen, that its toxicity to mice steadily decreases and its lethal effect on bacteria steadily increases. They have successfully saved mice suffering from various strepto-

cocci, pneumococci, and gram-negative bacilli. The results, the investigators say, show definitely that it is hopeless to seek for any one chemical which will prove effective against all disease germs, and that future work should be concentrated on the development of specific chemical poisons for each important bacterium."

An interesting contribution on the distribution of sugar in the blood of fishes is made by J. E. Gray and F. G. Hall (*Journ. Elisha Mitchell Sci. Soc.*, vol. 45, p. 142). They find that the whole blood of normal fishes contains about 75 mg. of sugar in each 100cc. The average ratio of plasma to corpuscle-sugar is: menhaden 2.12; pickerel 1.75; scup 1.47; silver hake 3.60; shad 3.80, and dogfish 1-1.03. It is found by E. A. Hewett (*Journ. Amer. Vet. Med. Ass'n*, vol. 77, p. 362) that the blood sugar of heifers and non-lactating cows is higher than that of lactating cows. A high value may be correlated with oestrus in heifers. The variations found by the author in pathogenic conditions are also recorded. It was found by W. L. Brown (*Georgia Agric. Exp. Stat. Bull.* No. 160) that the addition of pimento to poultry rations increases the pigmentation of the shanks, comb, and wattles, the effect being more pronounced in cockerels than in pullets. Pimento pigment appears in chickens five to six days after hatching. A. Rowinska (*Acta. Biol. Exp. Moscow*, vol. 6, p. 37) found that hemolyzed human blood or avian blood destroys uric acid. The velocity of decomposition is retarded by diminution of oxygen supply. Unhemolyzed blood does not catalyze the oxidation of uric acid. According to several authors (*Biochem. Zeit.*, vol. 231, p. 1) the male sexual hormone possesses basic properties and can be separated from the female hormone (menformone) by adding water to a concentrated benzene extract of male urine, the extract having first been mixed with alcoholic sodium hydroxide. This group of investigators described how the liquid separates into two layers, the male hormone passing into the benzene layer. Since the male hormone distills in a high vacuum at 90°, separation by distillation is also possible.

A. Leszler (*Chem. Zeit.*, 1930, p. 1092) describes the effect of intravenous injection of tetraiodophenolphthalein, trypanflavine and indigo-carmin to patients suffering from different diseases. His result shows that these injections result in a diminution in blood cholesterol. In a study of photosynthesis in various vine species, H. Schanderl (*Pflanzenbau*, vol. 3, p. 529) found that assimilation takes place with *Vitis riparia* in diffused light but with *Vitis vinifera* only in direct sunlight.

Methods of determination of carbon dioxide assimilation, and the significance of the results in German vine culture are discussed. According to L. Baldauf and L. Pincussin (*Klin. Woch.*, vol. 9, p. 1503) the bromine content of blood is practically 100 times that of iodine, which in normal metabolism averages  $10.9 \times 10^{-6}$  grams per 100cc; in syphilis it is about 50 per cent greater. Two children with nephritis showed an iodine content of  $31.7 - 32.9 \times 10^{-6}$  per 100cc. of blood. An interesting study by F. Müller, G. Cronheim, and M. Müller-Munk on the oxygen consumption of blood at high altitudes shows (*Biochem. Zeit.*, vol. 234, p. 302) that in rats under reduced pressure substances are present both in whole blood and plasma that consume oxygen. For man after living in high altitudes,

the presence of such substances may be demonstrated by addition of reduced glutathione to the blood sample.

F. W. Marshall (*Quant. Journ. Med.*, vol. 24, p. 287) finds that five types of dextrose-tolerance are distinguished in elderly people. The renal threshold in healthy old age is about 0.200 per cent. Pantocaine, a new local anæsthetic of the novocaine series is described by R. Fussgönger and O. Schaumann (*Arch. Exp. Path. Pharm.*, vol. 160, p. 53) as being nearly three times as toxic as cocaine and possessing 10 times the anæsthetic action of cocaine, when applied to a rabbit's cornea. O. Jervell (*Biochem. Zeit.*, vol. 235, p. 101) reports that the  $K_2Cr_2O_7$  method of Hansen for the determination of lactic acid in pure solutions should be somewhat modified and applied to its determination in blood filtrates.

It is interesting to note that H. D. Powers (*Science*, vol. 73, p. 316) in his studies on biochemistry in relation to intelligence finds that in idiots blood calcium is normal but that blood phosphorus is high. F. Rinne (*Kolloid. Zeit.*, vol. 56, p. 71) reports that sepia spermatozoa are gel-like, para-crystalline, living organisms, which constitute a transition between artificial liquid crystal and organized matter. In a study on the colloid chemistry of insanity W. D. Bancroft and G. H. Richter (*Journ. Phys. Chem.*, vol. 35, p. 1606) discuss the effects of different reagents on the nervous system and they seem to think that mental disorders are of two types; one resulting from increased and the other from decreased dispersion of the colloids of the nervous system. They reached the conclusion that in some form of insanity a coagulation of brain and nerve protein occurs, while in others a dispersion of protein takes place. In dementia præcox, paranoid, manic depression, and epilepsy a slight coagulation of protein has taken place in the brain, or parts of it, therefore a chemical agent which has the opposite or dispersing effect on proteins should work toward a cure. They believe narcotic addiction may be cured by judicious use of sodium thiocyanate, and that developments may come soon in its use as a treatment for hay fever.

GENERAL CHEMISTRY. Here are included a few notes of investigations that are of general interest but are not quite specific enough to place under physical chemistry.

It was found by Z. Bay. W. Finkenburg and W. Steiner (*Zeit. Phys. Chem.*, vol. 11, p. 351) that when a condensed discharge having a mean current strength of 50-100 amperes is passed through hydrogen at pressures between 0.5 and 5 mm, a group of fine lines of great intensity appears between  $\lambda$  5836 and 5761 Å, accompanied by other lines distributed over the whole spectrum whilst the remaining complex line spectrum almost disappears. R. S. Bradford shows (*Philos. Mag.*, vol. 11, p. 690) that the temperature variation of the constants in Langmuir's equation is desired theoretically for the absorption of gases on charcoal and the results are found to be in accord with those of Zeise. The fourth in a series of papers on "Dynamic Azeotropy" by Mlle. G. Schoule (*Bull. Acad. Roy. Belg.*, vol. 17, p. 191) points out that the generalized Duhem-Margules equation is applied first to binary systems and then to the more general case of systems with several constituents. P. C. Mahanti (*Nature*, vol. 127, p. 557) reports that a six-headed band system has been found in the

region 2000–2200Å. The bands are double-headed and the structure consists of six main branches and three satellites.

C. C. Kiess and H. K. Kiess (*Bur. Stand. Journ. Res.*, vol. 6, p. 621) in measuring the arc-spectrum of zirconium, report that nearly 1600 lines have been measured between 2085 and 9300Å. At least 80 per cent have been classified as combinations between terms of the singlet, triplet, and quintuplet systems. The terms, without exception are those required by Hund's theory and many have been confirmed by Zeeman effect. The ionization potential of the potential zirconium atom is 6.92 volts. Mlle. C. Chamie and L. Goldstein (*Journ. Chem. Phys.*, vol. 50, p. 228) find that the formation of groups of radioactive atoms is probably due to ionization of traces of gas in the emanation tube, forming centres for condensation of radio active atoms.

**MINERALOGICAL CHEMISTRY.** The discovery of new minerals is growing less each year. New localities sometimes furnish new minerals but the older sources have been pretty well studied. A few notes pertaining to the origin of certain minerals are included.

A new organic mineral called curtisite with the probable formula  $C_{24}H_{18}$  is reported by F. E. Wright and E. T. Allen (*Amer. Min.*, vol. 15, p. 160). It crystallizes in the orthorhombic system and is yellow to yellowish-green in color. S. Yimori, T. Yoshimura and S. Hata (*Sci. Pacro. Inst. Phys. Chem. Res. Toyko*, vol. 15, p. 83) report a new radioactive mineral similar to allanite that has been found in the Byozan Range. They have found its composition to be  $4 CaFeO_3 \cdot 3 (Ce, La, Y, Al, Fe Th) O_2 \cdot 6 (Si O_2 P_2 O_5) \cdot 2 H_2 O$ . The name of nagetelite is proposed. According to M. Berek (*Zett. Krist.*, vol. 76, p. 396) the intensity of the light reflected by anisotropic materials is calculated for both perpendicular and oblique incidence. Methods for determining the amount of the various materials in a section depend on measurement of either the degree of polarization or the intensity of the reflected light. A new mineral found in Bolivia with tetrahedrite and tin pyrites in a silver-tin vein consists of prismatic, lance-shaped crystals up to 2 cm. long. It is blackish-gray with hardness 2 and d4–18. According to F. Ahlfeld (*Zentr. Min. Geol.* for 1930, p. 365) its composition is  $Ag_2 \cdot 3 PbS \cdot 3 Sb_2 S_3$  and for it the name Ramdohrite is proposed. According to F. Stober (*Chem. Erde*, vol. 6, p. 440), in Moissan's experiment for the production of diamonds in 1893, the temperature was about 3000°, the pressure very high, and the time very short, whereas in those of Friedlander (1898) and of Hasslinger and Wolf (1903) the temperature was much lower, being about 1400°, the pressure normal, and the time long. There thus appears to be a contradiction which Stöber attempts to explain by his theory of crystallization. See also MINERALOGY.

**ORGANIC CHEMISTRY.** This branch of chemistry still persists in being a favorite one for research, especially in the laboratories of universities in Europe. New products are discovered and more and more efforts are being made to link up synthetic compounds with natural substances.

A new product was obtained by R. Charonnat and R. Delaby (*Bull. Sci. Pharm.*, vol. 37, p. 7) who described the preparation of dioxyphyramidone and its solubility relationship with pyrimidine and antipyrine; and also the color reactions for distinguishing the substances are given.

Dioxyphyramidone is found to be stable towards oxidizing agents, halogens, acid dyes, tannin, mercury and silver compounds, alkaloid salts, and phenols. According to R. Labes (*Arch. Exp. Path. Pharm.*, vol. 158, p. 42) the constant of the reaction in which sodium salicylate and caffeine combine to form a complex is found, by a partition coefficient method, to be between 30 and 40. In his study of the olive, G. Sani (*Atti. R. Acad. Lincei*, vol. 12, p. 238) finds a new hydrocarbon to which he gives the name oleastene. It has the composition of  $(C_7H_{12})_n$ , and the boiling point of 300° (low pressure). It was obtained during the separation of the cholesterol of the olive and forms an ozonide  $C_{21}H_{32}O_8$ . G. Klein and F. Schusta (*Oesterr. Bot. Zeit.*, vol. 79, p. 231), in their studies of the microchemical detection of alkaloids in plants, report numerous results of sensitive and characteristic reactions with various idiosalts in the determination of echinopsine in the various species of *Echinops*. According to W. T. Astbury and H. J. Woods (*Nature*, vol. 127, p. 663) the sequence of the numbers 1, 2, 3, and 6 as multiples of Svedberg's value of 34.500 for the molecular weight of proteins is presented in terms of the ordinary peptide chain,  $CO.NH.CHR.CO.NH.CHR$  and possibly crystallographic combinations are outlined. The observed constant value of 34.500 is considered to be due to the vibrational instability of peptide chains of length greater than a certain limit. The disruptive action of high-energy quanta in the length and cohesion of peptide chains is shown by experiments on unstretched wool, which after exposure for many hours to the full beam of Shearer X-ray tube, shows many of the properties characteristic of wool which has been exposed under tension to the action of steam. From an examination of the cellulose obtained from different varieties of wood, E. Schmidt, K. Meinel, and W. Jandeleuer (*Naturwiss.*, vol. 18, p. 376) conclude that the least equivalent weight of cellulose corresponds with  $(C_6H_{10}O_5)_{98}$ . H. Staudinger (*Ber. Deut. Chem. Ges.*, vol. 64, p. 1407) presents his thirty-third paper on isoprene and caoutchouc and reports that the determination of the molecular weight by the behavior of terminal groups is not possible in the case of caoutchouc in which they form only an insignificant part of the molecule.

**PHYSICAL CHEMISTRY.** Much interest has been manifested during the year in the study of the composition and properties of the atom. Whether we are on the eve of greater discoveries concerning the power that brings about chemical composition may soon be known.

At an important international congress of physicists held in Rome, Italy, during October Prof. Robert A. Millikan of the California Institute of Technology, announced the discovery of an instrument consisting of an X-ray microscope, which he termed a multiple crystal spectrometer which is composed of fifty spectroscopes arranged in an arc, along which sweeps an X-ray. He showed photographs illustrating the activities of two electrons in beryllium. The electron is approximately 1700 times smaller than the atom, yet the invention caught it in action. The nuclei, the movements of which were demonstrated, are conceived for the sake of convenience as miniature suns, immensely heavy, about which revolve a cloud of electrons, the whole forming an atom. Also at this meeting Prof. Niels Bohr, author of the solar system conception of atoms, showed

how he approached the study of the protons, that is, the nuclei, of atoms by observing the action of electrons outside the nucleus.

Later in October an Associated Press dispatch from Berkeley, Calif., announced the installation of a huge electro-magnet at the University of California by which a method of breaking down the component parts of atoms was expected and possibly a procedure to make gold out of less precious metals. The experimenters claimed to have succeeded in isolating and collecting the protons, or nuclei, of hydrogen atoms and would apply these protons under electrical force as projectiles with which to break up the atoms of other elements. By using the hydrogen protons as "bullets" propelled by electrical force the scientists expected to "shoot" the protons or nuclei out of atoms of other substances, much as an ordinary rifle bullet would knock the bulls'-eye out of a target. Thus robbed of its nucleus, the atom of the baser substance would be broken up, causing it to change its nature. "By using 10,000 volts over and over again, the hydrogen protons already have been 'stepped up' to energies of 1,000,000-volt electrons. Nothing like this ever has been achieved before in any laboratory. It seems that these protons are traveling at the rate of 8000 miles a second. The most important conclusion of all is that the energy which may be imparted to these protons is limited only by the strength of the magnet which keeps them going in circles. With protons from a machine built around this magnet it should be possible to blast the nucleus of any atom on earth."

From Princeton came the announcement in November that a simple and inexpensive method of building generators capable of developing 15,000,000 to 20,000,000 volts, which experts regard as finally opening the way toward the realization of the age-old alchemists' dream of transmutation of the elements, had been perfected at the Palmer Physical Laboratory, Princeton University, by Dr. Robert J. Van de Graaff. The new generator was expected to supply science with a new tool with which to bombard and smash up the atom. This was being done on a small scale by employing the Alpha particles from radium as the "cannon." But as the supply of Alpha particles from radium is small and extremely costly the new generators are expected to supply Alpha particles cheaply and in much larger amounts.

Adsorptive power as explained by a new theory based on London's conception of molecular forces is discussed by F. London and U. Polanyi (*Naturwiss.*, vol. 18, p. 1079). It was found by J. Warner (*Zeit. Phys.*, vol. 67, p. 207) that metals and salts show in a high vacuum an increase in the photo-electric emission with time, which is independent of the radiation. The cause of this increased sensitivity, shown by the unsaturated emission, is the removal or discontinuance of the layer of gas absorbed on the metal or salt. It is reported (*Zeit. Physik.*, vol. 69, p. 111) by I. Ameiser that experiments on silver, gold, and copper indicate that electron emission diminishes and surface potential remains unchanged as the metal passes to the liquid phase.

NECROLOGY. Among the American chemists who died during the year, the following are noteworthy: John Edgar Teeple, born in Kempton, Ill., on May 14, 1874; died in New York City, on March 23; leader in the development of the American potash industry; and Perkin medalist

in 1927. Samuel Wilson Parr, born in Granville, Ill., on Jan. 21, 1857; died in Urbana, Ill., on May 16; emeritus professor of applied chemistry, University of Illinois; Chandler medalist, and president of the American Chemical Society. Frank Wigglesworth Clarke, born in Boston, Mass., on Mar. 19, 1847; died in Chevy Chase, Md., on May 23; professor of Chemistry in University of Cincinnati; chief chemist of U. S. Geological Survey; world authority on atomic weights; and author of *Constants of Nature* and *Data of Geochemistry*. Edward Hart, born in Doylestown, Pa., on Nov. 18, 1854; died in Easton, Pa., on June 6; emeritus professor of chemistry in Lafayette College; long editor of the *Journal of the American Chemical Society*; and founder of the Baker and Adamson Chemical Company, and of the Chemical Publishing Company. Stephen Moulton Babcock, born in Bridgewater, N. Y., on Oct. 22, 1843; died in Madison, Wis., on July 2; emeritus professor of agricultural chemistry in the University of Wisconsin and discoverer of a method to determine the butter fat contents of milk for which he received the Capper award (medal and \$5000) in 1930 for "The contribution of greatest importance to American agriculture." Edward Goodrich Acheson, born in Washington, Pa., on Mar. 9, 1856; died in New York City on July 6; chemical inventor and manufacturer. The abrasive carborundum was his most important invention and gained for him the Perkin medal, and other recognitions. Lucius Lincoln Van Slyke, born in Centerville, N. Y., on Jan. 6, 1859; died in Geneva, N. Y., on October 1; chemist in the New York State Agricultural Experiment Station in Geneva and professor of dairy chemistry in Cornell University. Joseph Merritt Matthews, born in Philadelphia, Pa., on June 9, 1874; died in San Diego, Calif., on October 12; author of books on industrial chemistry and noted as a consulting chemist and expert in textile chemistry and dye-stuff. Edward Hopkins Jenkins; born in Falmouth, Mass., on May 31, 1850; died in New Haven, Conn., on November 7, chemist and organizer and director during 1900-23 of the Connecticut Agricultural Experiment Station, the first of the kind in the world; author of many chemical papers, including "Connecticut Agriculture" in *History of Connecticut*. There are elsewhere appropriate obituary sketches of these chemists.

BIBLIOGRAPHY. Among the new books published during the year are the following: Chittenden, *The Development of Physiological Chemistry in the United States* (Monograph no. 54, American Chemical Society); Friend, editor, *A Textbook of Inorganic Chemistry* (vol. vii, pt. 2, "Sulphur, Selenium, and Tellurium"); Mellor, *A Comprehensive Treatise on Inorganic and Theoretical Chemistry* (vol. ii, "Tellurium, Chromium, Molybdenum and Tungsten"); Mitchell, *Recent Advances in Analytical Chemistry* (vol. i, "Organic Chemistry"; vol. ii, "Inorganic Chemistry"); Peters, *Quantitative Clinical Chemistry* (vol. i); Smyth, *Dielectric Constant and Molecular Structure* (Monograph no. 55 of the American Chemical Society); *Chemistry at the Centenary Meeting of the British Association for the Advancement of Science*, a collection of important papers; also the following new editions: Association of Official Agricultural Chemists, *Methods of Analysis* (3d ed.); Berntsen, *A Textbook of Organic Chemistry* (New edition revised to

date); Porter, *The Carbon Compounds* (2d ed.); Sherman, *The Vitamins* (2d ed.); Taylor, *A Treatise on Physical Chemistry*, (2d ed.) 2 vols.

**CHEMISTRY, INDUSTRIAL.** In this field steady progress is reported. Naturally Germany, Great Britain, France, and Italy, as well as the United States, felt the effect of the general world economic depression in lessened production, decline in prices, and foreign-trade reductions. It may be said, however, that the chemical industries were affected less than business in general. Notwithstanding the tendency to reduce expenses, research was continued.

**AMERICAN CHEMICAL SOCIETY.** The 81st meeting of this Society was held in Indianapolis, Ind., during March 30 to April 3, at which 1873 persons were registered and 402 papers read before 16 divisions. A special feature of the meeting was the dedication of the Indiana University Chemistry building with appropriate addresses.

Three important symposiums featured the proceedings. One, on "Contemporary Developments in the Chemistry of Physiologically Active Substances," was held under the auspices of the Divisions of Biological, Medicinal, and Organic Chemistry, with Prof. James B. Conant of Harvard University as chairman. The Division of Chemical Education, of which Dr. John N. Swan of Tuckahoe, N. Y., was chairman, sponsored a second symposium on "Cooperation between Industry and Chemical Education." A third, on "Mathematics in the Service of Chemistry," was given by the Division of Physical and Inorganic Chemistry, headed by Prof. Farrington Daniels of the University of Wisconsin. Among the papers presented was one by Dr. H. A. Shonle on drugs producing hypnotic sleep as a substitute for anesthetics in operations. According to Dr. Shonle: "It is possible to predict the effectiveness and the duration of hypnotics which have not yet been synthesized. New advances in anesthesia seem possible through the use of the amyl-ethyl-barbituric acids and nitrous oxide, nausea is eliminated, greater comfort is afforded the patient, and far less mental distress is observed." There seems to be hope of finding a hypnotic drug producing a sleep in which no anesthetic will be needed.

Dr. R. N. Harger of the Medical School of the University of Indiana described a new scientific method for detecting the presence of alcohol which registers any degree of drunkenness, merely by catching some of the drinker's breath, and is so sensitive that it detects alcohol even when all odor is expurgated from the breath. The suspected breath is blown into an ordinary toy balloon. From there it is bubbled through a red liquid, which speedily turns almost white if there is alcohol. This red fluid is a combination of potassium permanganate, which gives the red color, and of a certain critical amount of sulphuric acid. It shows how much alcohol the blood carries. One part of alcohol in 1000 of blood, by weight, is the beginning of intoxication. Five parts means dead drunk, six parts almost certain death. It is estimated that it takes about three ounces of whisky in a 150-pound man to produce the beginnings of drunkenness.

Dr. W. C. Rose of the University of Illinois contended that a new element in diet, a compound hitherto unrecognized in proteins, was on the verge of being discovered. "This ma-

terial is certainly an indispensable constituent of the diet. If we succeed in its isolation, as we anticipate, we shall then be able to determine with comprehensive ease which of the remaining amino acids are required for normal nutrition. The nutritive importance of the amino acids is in itself a vast field which must be thoroughly explored. Of the twenty known components of proteins, the indispensable nature of only four have been absolutely established."

Discovery of a synthetic champagne-colored oil excelling nature's product was disclosed in a paper by F. W. Sullivan, V. Voorhees, A. W. Neely, and P. V. Shankland of the Indiana Standard Oil Company. It is made from waste paraffin wax, an element in natural lubricating oil so undesirable that millions of dollars have been spent in eliminating it from oil. It is claimed that the new oil stands heat with less thinning and extreme cold with less thickening "better than any known natural oil." It is "expensive," but has found a market "well suited for many uses where requirements are unusually severe. For airplane engines, shock absorbers, automobile's gear shifts, and other places where stability is very important the new oil has been found to surpass all previous oils and is hailed as a decided forward step in the art of lubrication."

Civilized men are eating a surprising quantity of lead, according to Dr. Robert A. Kehoe of the University of Cincinnati. He reported recent experiments showing that the body protects itself from any sudden influx of extra lead by excreting it as fast as it is taken in. He reported that lead was found in milk, bread, bran, crackers, frankfurters, sausages, meat, potatoes, candy, ice cream, and many fruits. He attributed the lead in bread, bran, and crackers to absorption of this element by growing grain. It passes into milk through the cow's feed. Candy and ice cream contain a fairly high amount because of methods of commercial production. The lead in fruits is credited to sprays and canning.

Prof. W. H. Eddy of Teachers College at Columbia University found the presence of adequate amounts of vitamins A, B, C, and G for health needs in forty-nine different canned foods. Dr. Eddy declared that present-day housekeepers might rely freely on canned foods, such as milk, meats and fowl, sixteen common vegetables, various fruits, and desserts; and even on canned brown bread. The tests were made on rats and guinea pigs. The rat experiments extended over a year, which was equivalent to about twenty-five years of human life. All the animals were found to average better in weight than those fed on a stock diet.

According to Harold Levine of the South Carolina Food Research Commission, Prof. Roe E. Remington of the Medical College of South Carolina and F. B. Culp of the South Carolina Food Commission, there is sufficient iron, copper, and manganese in oysters taken off South Carolina to retard development of nutritional anemia. Dr. Frederick R. Greenbaum of Chicago, Ill., described a cure of anemic dysentery now made in the United States, which is called chiniofon and is an almost forgotten German chemical compound first produced fifty years ago. Forty per cent of the Chinese are said to suffer from the disease and it is said that one out of ten of the inhabitants residing in the Southern States in the United States is similarly afflicted.

Prof. J. P. Montgomery of the University of Alabama told of the recent discovery of a process by the university's chemical staff for the production of highly satisfactory varnishes from table sugar. These are made by producing resins from the combinations of certain sugars with aniline and dissolving the resin in acetone. They have been made from four varieties of sugar, but xylose was the most promising, as it was a cheap sugar which is produced in large quantities from waste cottonseed hulls and had few other uses. "If it is desired to make a varnish out of ordinary table sugar, the sugar is first inverted by acid, producing glucose and fructose, and a resin made by the addition of aniline. The resin when dissolved in acetone gives a varnish similar to that described."

The Buffalo meeting was held during August 31-September 4 and about 390 papers were read before 19 divisions and sections. The registration showed 2057 persons present. Among the papers presented and discussed at this meeting were the following:

Wallace H. Carothers and Julian W. Hill of the experimental station of E. I. du Pont de Nemours and Co., of Wilmington, Del., reported a new process for making silk-resembling material, saying that their results "clearly demonstrate the possibility of obtaining useful fibres from strictly synthetic material." The new product is shown to resemble cellulose and silk in the general plan of their molecular structure. Hitherto the various artificial silks, such as rayon, could not be made out of "strictly synthetic material." Rayon is pure cellulose, a complicated organic product. This cellulose is turned into rayon by substituting a machine for the silk worm. The new process makes it possible for the first time to begin with simple organic substances and build up from them to the more complex ones with molecular weights several times greater than had been possible hitherto to create artificially. "The fibres so produced are of good strength, pliability, and high lustre. The elastic properties are remarkable. Both the rate and the extent of recovery from stretch are greatly superior to viscose rayon and at least as good as silk. The lustre is very brilliant and the fibres can be tied into small tight knots without breaking."

The New Magnetic Eye, developed by Prof. Frederick Allison of Alabama Polytechnic Institute, is a new method of chemical analysis and was said by him to constitute "a major scientific advance." It is known as the magnetoptic method, a combination of light and magnetism. The light is practically extinguished in the magnetized liquid by the elements therein. But each element takes a different fraction of time to do the snuffing out and so reveals its presence.

In a mixture of several substances each one retains its own reaction-time unaffected by the presence of the others, and each substance retains its power to manifest its individual reaction-time even after the solution is diluted until the substance is present in only one part in a hundred billion. The magnetoptic method enables one to find out just how much of the substance is present. It is possible, for example, to detect in our foods very minute quantities of metals which, until recently, were not known to be a content of foods and the importance of which to health has been a question of much concern to research workers in the field of biochemistry.

The new eye has given traces of the two missing elements that no one yet has found on earth,

although scientists are certain they exist. They are known simply as elements 85 and 87. Chemists predict that 87, when found, will be radioactive, jet black, of metallic lustre, probably insoluble in water and will melt at about 450° Fahrenheit.

Long-time vegetarians are found to produce heat—or energy—at a lower rate than meat eaters, according to a paper by Glen Wakeham and Louis O. Hansen of the University of Colorado. The difference in energy production showed in measurements of the "basal-metabolic" rate. Five lifetime vegetarians were 13.6 per cent below normal. Ten vegetarians of five years or more duration were 1.8 per cent under normal, and near vegetarians who ate meat only occasionally were 13.4 below. But this lower energy rate made no difference in health.

Antiurease, the world's first antienzyme, discovered by Dr. James B. Sumner and J. Stanley Kirk of Cornell University, was described. An "antienzyme" is something that neutralizes an enzyme and prevents it from functioning. Enzymes are chemical substances secreted by living things and so essential that without them death is a matter of a few hours. The popular appeal in antiurease is the light it gives on the existence of unidentified substances, probably chemicals, which exercise in the body the balance between health and illness, life and death, or normality and abnormality. Such a balance is the unidentified thing that keeps one's hands from growing too big, or determines the size of the heart and all other organs. The famous chicken hearts of Rockefeller Institute show what happens when the balance is missing. They grow so continuously that if there were sufficient food they could become as big as the earth ultimately. Some of the medical sera and vaccines are well-known examples of this principle already in practical use.

Discovery of an "inhibitor" in chicken cancer by Dr. James B. Murphy of Rockefeller Institute is also a recent medical example. The cancer contains something which Dr. Murphy extracts to "inhibit" growth of the same kind of cancer. He announced a further discovery that this chicken inhibitor shows some control over mouse cancer. It reduces the number of "takes" when cancer is transplanted into mice, and it slows down the cancer development to a "significant percentage." What this inhibitor substance may be has not been determined. In his latest scientific article Dr. Murphy suggests that an "incidental enzyme" in the chicken cancer extract may be the substance attacking the mouse cancer cells. The best known enzyme is pepsin, digestive aid which breaks down proteins in the food into the amino acids which the body can assimilate.

Two enzymes have recently been isolated in pure form and proved to be minute crystals. Dr. Sumner is credited as the first scientist to isolate an enzyme, urease. Urease, for which he had found the inhibitor, antiurease, is an enzyme of vegetable origin. The discovery indicates that one of the reasons why the all-important enzymes do not ordinarily run wild and produce so freely as to destroy health, is the presence of a safety device locked in each one. His work does not show that this safety factor exists full fledged, but that its germ lies somehow within the enzyme. When the enzyme urease was injected into the ear vein of a rabbit, it caused convulsions within five minutes and death within an hour. By starting with very small doses and

increasing them gradually, Dr. Sumner developed immune rabbits. They withstood seventy-five times the amount of a lethal dose without even a sign of disturbance or a rise in blood pressure. In the blood serum of these rabbits, Dr. Sumner found the immunizing substance, measured its volume and named it antiurease.

Dr. Alexander O. Gettler, chief New York toxicologist of Bellevue Hospital, and Drs. Joseph B. Niederl and A. A. Benedetti-Pichler of the chemical department, Washington Square College, New York University, described an alcohol isolated from the tissues of the human brain, liver, and blood, that is exactly the same substance as used in alcoholic beverages and is present normally in the tissues during life. "The facts which prove this are that many of the tissues used were analyzed within fifteen minutes after death. The human blood samples were taken from living individuals and analysis started right after the taking of the blood. Analysis of the same sample or tissue of blood after standing twenty-four hours in the refrigerator, gave the same alcohol content." The average alcohol found in the human brain was .0004 per cent; liver, .00256 per cent, and blood, .004 per cent. The content in dogs was: Brain, .0003 per cent; liver, .0007 per cent; blood, .0013 per cent. The pig brain contained .00007 per cent, showing that the higher the animal the greater the alcohol content. Before the tests were made it was made certain that no alcohol of any kind had been taken by the subjects whose blood and brain were tested. The finding of a small amount of acetone present in normal human beings was also noted. Acetone has been found previously in bodies of diabetic patients, and heretofore considered a sign of ill-health.

The discovery was reported by Drs. Gladys E. Woodward and Edith G. Fry, working under the direction of Dr. Ellice McDonald, of the University of Pennsylvania Cancer Research Laboratories, that sugar aids the growth of cancer. In their paper they said that

The essential difference between cancer tissue and normal tissue is the ability of the cancer to digest the animal sugar in a different and more expeditious way from normal. A study of the blood of 223 cancer patients showed that they had, in general, 20 per cent more sugar in their blood than normal people. It was concluded that even a slight increase in the amount of blood sugar was of great importance in the treatment of cancer. The greater the amount of sugar there is in the blood of cancer patients the shorter is the expectation of their lives. There is a greater growth of the cancer when there is a large amount of sugar in the blood, the tumor grows faster and there are a greater number of dividing or growing cells in the cancerous tumor. Cancer patients with a low blood sugar respond well to treatment and have a better chance of survival, with slow growth of the tumor.

Successful production of synthetic textile fibres from sugar, by means of the vinegar plant, was reported by Harold Hibbert and J. Barsha of McGill University, Montreal, the results leading the experimenters to express a hope for the ultimate production of synthetic textiles from carbon dioxide and water. Prof. James R. Bailey of the University of Texas told of the progress of "some research of unusual interest" conducted by Miss Ivy Parker, who is engaged in experiments on the constituent bases of cotton-seed, with the object of ascertaining whether it may be possible to produce synthetic gasoline from it. Other papers included "Some Clinical Aspects of Endocrine Therapy," by Dr. William Engelbach of New York City, former professor of

clinical medicine at University of St. Louis, who told about the "growth hormone"; Drs. R. G. Hiskins of Harvard Medical School and F. H. Sleeper of Worcester (Mass.) State Hospital, who told of the insanity hormone, and Dr. I. M. Rabinowitch of Montreal General Hospital, who reported on the etiology (cause) of diabetes.

Other events of importance that took place at this meeting were: The celebration of the tenth anniversary of the founding of the division of chemical education by the late Dr. Edgar Fahs Smith, for many years provost of the University of Pennsylvania. More than a score of educators discussed plans to improve chemistry teaching and methods to bring about greater public understanding of the science. Also a symposium was held with the division of the history of chemistry on the "History of Chemical Education in America." The Langmuir prize of \$1000 from the American Chemical Society awarded for the first time and founded by a brother of Dr. Irving Langmuir of the General Electric Company, is bestowed "in recognition of the accomplishment, in America, of outstanding chemical research by a young man or woman preferably working in a college or university." It was awarded to Dr. Linus B. Pauling of the California Institute of Technology. His researches have dealt with crystal structure, the quantum theory of the dielectric constant of gases, atomic and molecular structure, and determination of the nature of chemical bonds.

Prof. Moses Gomberg of the University of Michigan became president in Jan. 1, 1931, for the term of one year, and was to be succeeded in 1932 by Dr. L. V. Redman, vice president and director of research of the Bakelite Corporation, Bloomfield, N. J. The total membership of the Society was 19,053.

**SOCIETY OF CHEMICAL INDUSTRY.** This organization held its 50th annual or Jubilee meeting in London, England, during July 13-19, under the presidency of Sir Harry McGowan who was chosen to succeed Lord Melchett, who died on December 27, 1930. A special feature of the Jubilee meeting was the opening of the Chemical Plant and Research Instruments Exhibition, which was continued during the week, and one day was given over to a Jubilee Fuel Conference similar to those held annually in various cities in Great Britain. In honor of the Jubilee *A History of the British Chemical Industry* was compiled by Dr. Stephen Miall and published by the Society, as well as a Jubilee Souvenir Number of the *Journal* containing a portrait and short biography of each of the seventy-five remaining Original Members to whom a Jubilee plaque in silver, specially designed for the event by Mrs. Ernest Gillick, was presented at a meeting held in the Guildhall. The two surviving original members in the United States were Dr. Marcus Benjamin and Dr. K. F. Stahl.

At the business meeting, the Secretary reported the membership to be 4541 as against 4506 in 1930. The Society's medal was presented to Dr. Herbert Levinstein, who delivered an address on "From Within the Dyestuff Industry." Ten honorary memberships were conferred, of which the one in the United States was given to Dr. Charles L. Parsons of Washington, D. C. The elections resulted in the choice of Prof. Gilbert T. Morgan of the Chemical Research Laboratory for president, while the other officers remained unchanged. Nottingham was chosen for the meet-

ing place in 1932. Generous invitations to manufacturing plants, delightful entertainments, and pleasant excursions were conspicuous features of the Jubilee meeting.

**EXPOSITION OF CHEMICAL INDUSTRIES.** This event for the 13th time was held in the Grand Central Palace, New York City, during May 4-9. More than 450 exhibits, representing the latest discoveries and researches in the chemical and allied industries, were displayed on three floors. The exhibits ranged from new dyes, alloys, and plastics to precision instruments measuring infinitesimal particles, and from new substitutes for glass and china, which are practically unbreakable, to huge, intricate machinery which, directly or indirectly, affects the daily life of every person. Among the exhibits to attract attention was a small bottle of the new metal rhenium, or element No. 75, which was discovered in Berlin in 1925 by means of an X-ray spectrograph. It is the first time that this rare metal has been displayed in the United States. Gallium, a metal which melts at blood temperature, was also shown. Another exhibit to attract attention was a specimen of synthetic rubber manufactured from a by-product of petroleum, a hydrocarbon known as butadiene, obtained from cracked petroleum gas. The new process holds out promise for manufacture on a commercial scale. Many visitors were attracted by the demonstration of the mixing of oil and water, as a result of which better polishes, cleansers, cosmetic creams, lotion liniments, lubricants, flavors, and other objects in common use are now made. More than 500 students, representing 18 colleges and universities, attended the students' course of lectures held in conjunction with the exposition, under the direction of Dr. W. T. Read, Dean of Chemistry, Rutgers University. Over 100,000 visitors were said to have viewed the exhibits and "from every viewpoint the exposition (was said to be) an outstanding success."

**MEDALS.** The Perkin medal of the American Chemical Society was on January 9 presented to Arthur D. Little. His achievements include important work in the fields of artificial silk and petroleum. He was chemical engineer and superintendent of the first mill in the United States to manufacture sulphate wood pulp. The William H. Nichols Medal of the American Chemical Society was on March 13 awarded to John Arthur Wilson "for outstanding achievement in colloid chemistry, applied particularly to leather and sanitation." The American Institute of Chemists on May 9 conferred on Andrew W. Mellon and his brother Richard B. Mellon the medal of the Institute for their "noteworthy and outstanding service to the science of chemistry and the profession of chemist in America." The Willard Gibbs medal of the Chicago section of the American Chemical Society was awarded on May 22 to Phocbus A. Levene "as the outstanding American worker in the application of organic chemistry to biological problems."

The medal of the Society of Chemical Industry was awarded on July 15 to Dr. Herbert Levinstein for his "conspicuous services to applied chemistry by research, discovery, invention, or improvement." This medal is awarded every two years. The Jacob F. Schoellkopf medal of the American Chemical Society was on September 2 presented to Frank J. Tone. The Grasselli medal of the American Section of the Society of Chemical Industry was on November 6 presented to

Lawrence V. Redman for his paper on the "Cost of Research and its Apportionment," presented on December 9, 1927. The Electrochemical Society awarded its Edward Goodrich Acheson medal on September 3 to Dr. Edward Fitch Northrup for his studies on the development of high frequency furnaces used for the melting of metals and alloys. On March 26 Dr. Claude S. Hudson, professor of chemistry at the National Institute of Health of the Public Health Service, received the Hillebrand prize of the Chemical Society of Washington. The prize was awarded to Dr. Hudson for his work on the ring structure of sugars, highly technical but of fundamental importance in chemistry and biology.

**RHENIUM.** According to a press dispatch from Berlin, Germany, dated July 16, Dr. Walter Noddack has found a new source of the recently discovered metal rhenium and it contains up to 1 per cent of the element. The metal, dark gray in color, is heavier than gold and has a melting point of 3440° Centigrade, which is higher than tungsten. When quantity production is achieved, rhenium may prove useful in the radio industry and for television apparatus. It was first exhibited in the United States at the Exposition of Chemical Industries held in New York City on May 5.

**LIQUEFACTION OF HELIUM.** Liquid helium was produced on April 3 for the first time in the United States at the Bureau of Standards in Washington, D. C. Helium, the gas first discovered in the sun and of immense practical value in filling airships, because it is non-combustible, is the most difficult substance on earth to liquefy and freeze. The first step in making liquid helium is to produce liquid hydrogen, which is accomplished by subjecting the gas to a pressure of 2000 lbs. to the square inch, after which it is cooled by liquid air to a temperature of 310 degrees below zero. Then a supply of helium as pure as can be obtained by refining processes is compressed to a pressure of 200 lbs. to the square inch, after which the compressed gas is cooled with liquid air and liquid hydrogen to the temperature of the latter, 423 degrees below zero. The helium is a gas even at this low temperature. The next step is to allow it to expand, thereby producing additional refrigeration and lowering the temperature of the helium to 456 degrees, at which it liquefies. In making liquid helium it is first necessary to insure a plentiful supply of liquid hydrogen. Liquefaction of this rare gas, next to hydrogen the lightest of all the elements, was accomplished in the low temperature laboratory of the Bureau of Standards at a temperature of 456° Fahrenheit. This is only three points below the hypothetical absolute zero at which all movement of gases stops. The liquid was produced by boiling helium at low pressure. The boiling point was 450° Fahrenheit and once this was reached the point of liquefaction was found only 6 degrees lower.

**VALUABLE ALLOY.** Hipernik is a recently discovered refined iron-nickel alloy. It is annealed in an atmosphere of hydrogen at a temperature ranging from 1000° to 1300° for many hours. This process removes small impurities, chiefly oxygen, said to exist in the ordinary 40-60 per cent alloy. Such impurities in an alloy, even if they amount to only a few hundredths of 1 per cent, produce differences in the magnetic properties of several hundred per cent. Hence

chemists have been seeking a method of removing the last traces of impurities. They have succeeded in hipernik, which is the nearest approach to an ideal magnetic alloy ever developed. This alloy is noted for its high permeability, negligible hysteresis loss, ductility, non-corrosive quality and its comparatively low cost of production.

If the 10,000,000 transformers that furnish power and light to the United States were placed side by side they would form a solid fence along the National Pike from Baltimore to Los Angeles. In operation they dissipate about ten billion kilowatt hours of energy in heat. This waste costs many millions of dollars annually, one-half of which could be saved by the use of hipernik in those transformers.

In the research work observations were made by passing X-rays through thin films of different materials. It was known that the atoms of many materials were arranged in cubic symmetry with iron atoms at the corners and centres of the cubes and nickel atoms at the corners and centres of the faces of the cubes. Millions of these cubes form what are known as space lattices. Then it was discovered that the magnetic properties of iron depended upon the regularity of the arrangement of the atoms in the space lattices. A mere trace of impurity served as a tiny wedge, distorted the symmetry and disturbed the magnetic properties.

**SPARK PLUG ALLOY.** Experience had established a belief that nickel wire was the best material for spark plug points. A study by Prof. O. S. Duffendack and Dr. R. A. Wolfe of the University of Michigan Department of Engineering Research shows that very pure nickel produced a much poorer spark plug than the commercial nickel. Investigation revealed that the superior sparking of the commercial metal lay in an impurity of small portions of magnesium, which originally was added to remove sulphur while the nickel was molten and which was supposed to evaporate completely before cooling. This magnesium greatly facilitated the spark, but it also was used up faster than the nickel, with the result that when the magnesium impurity was gone the spark plug deteriorated. The magnesium could not be distributed evenly, and so the Michigan scientists began a search for a substitute, which they found in barium. In the heat of the spark, they find barium evaporates away at the same rate as the nickel, producing a generally long-lived plug, with a strong spark from relatively low voltage.

**SYNTHETIC RUBBER.** At last the production of this long sought for product was announced. According to the daily newspapers on November 2, at a meeting of the Rubber division of the American Chemical Society held in Akron, Ohio, the announcement was made in a series of technical papers by F. B. Downing, W. H. Carothers, and Ira Williams, each speaking for a group of chemists who participated in the research work.

The new rubber is made by the controlled polymerization of chloroprene, chloroprene being made by the catalytic polymerization of acetylene to monovinylacetylene which is then treated with hydrogen chloride to produce chloroprene, according to the reaction developed by Dr. J. A. Nieuwland of Notre Dame University.

This chemical result led to the selection of the trade name, "duprene." It was claimed for "duprene" that it was much more resistant than natural rubber to the swelling action of gasoline, kerosene, and other solvents that are harmful to

rubber. It was also more resistant to oxygen, ozone, and ether, chemicals that attack rubber.

An interesting feature of the substance is that it can be vulcanized by the application of heat alone, whereas to vulcanize natural rubber it is necessary to add sulphur.

An artificial latex can be made from chloroprene. This artificial latex is a milk-like liquid consisting of particles of fully vulcanized synthetic rubber suspended in water which, upon drying, gives a sheet of fully vulcanized rubber. The "duprene" latex differs radically from natural latex because of its increased penetrating power, so that it becomes possible to impregnate many porous materials that cannot be impregnated with natural rubber latex. Another property of the new rubber is that its X-ray diagram is reported as similar to that of natural rubber, indicating that it has the same type of molecular structure. Synthetic rubbers have been produced before by many scientists, but none of these products, so far as known, has given the same type of X-ray diagram as natural rubber.

**NEW ANÆSTHETIC.** A study reported in February by Drs. J. F. Fulton, E. G. T. Liddell, and B. M. Riech in the *Journal of Physiology* of London, England, and financed by the Medical Research Council of Great Britain reveals remarkable properties of a new anæsthetic which is a liquid preparation of diallyl-barbituric acid, and administered by injection. It acts on the lower brain centers—the thalamus, mid-brain and upper part of the medulla oblongata. It lowers blood pressure without impairing heart action or respiration. It produces profound anæsthesia without interfering with the spinal cord reflexes, such as the knee jerk. But its most valuable property is that of stricting the innumerable small blood vessels of the brain which hitherto have been a great obstacle to the brain surgeon. Working with monkeys, the experimenters found that they could perform such major operations as removal of the cerebellum or the cerebral hemispheres almost bloodlessly without the necessity of closing off any of the great arteries of the region. They were able to perform three successive operations on the same animal—removal of the cerebellum and of the right and left hemispheres—at three-week intervals. The animals used in the experiments remained quiet from 12 to 36 hours.

**NEW DENATURANT.** According to orders issued by the U. S. Bureau of Industrial Alcohol a new denaturant with the following formula came into use on Jan. 1, 1931. "To every 100 parts by volume of ethyl alcohol of not less than 160 degrees proof add one part by volume of the compound, or one similar thereto, known as aldehyol, grade A, or 1.25 parts by volume of the compound, or one similar thereto, known as alcotatate." Aldehyol is an oxidized kerosene devised by Prof. J. H. James of the Carnegie Institute of Pittsburgh, while alcotatate is a by-product of California gasoline which has been described "as a more or less complex compound of aldehydes, sulphur mixtures, and a large array of other organic substances." These compounds "have a horrible smell and taste," according to the experts of the Bureau.

**MENACE OF METHANOL.** In a report of progress of experiments on animals published in August by the American Chemical Society, Dr. Carey P. McCord of the Industrial Health Conservancy Laboratories, Cincinnati, Ohio, said that the death of 208 persons from drinking methanol

(methyl alcohol) reported during the year, had overshadowed other dangers. Skin absorption and inhalation of methanol vapors were revealed as portals of entry fully as dangerous as oral intake. The tests would seem to disprove the theory held by medical authorities that the poisonous effect of methanol is due to the formation of formaldehyde caused by oxidation. In his experiments, Dr. McCord used 265 animals, of which 31 were monkeys, 58 rabbits, and 176 rats. The materials for test purposes included crude, 95 per cent, and highly purified methyl alcohols, and also synthetic methyl alcohols derived from three sources of manufacture. Dr. Harrison E. Howe, editor of *Industrial and Engineering Chemistry*, the journal of the American Chemical Society, urged that industries should unite to protect the "moronic minority." He suggested that the coloring of methanol used for anti-freeze in automobile radiators be continued; that some distinctly deterrent material be added as an additional warning, and that poison labels be put prominently on all packages containing the poisonous fluid.

**SYNTHETIC COTTON.** From Moscow, Soviet Republic, an Associated Press dispatch of July 18 announced the publication by the Institute for experimental Research of a machine that "cottonizes" rough bast fibres, converting them into manufacturable textiles. The new machine, called a "decorticator," utilizes flax, hemp, "mandyr," and ramie, fibres that grow extensively in many sections of the Soviet Union and are far harder than cotton, which requires certain climatic conditions. With it, only 30 minutes are required for the "cottonization" process, which consists of separating the fibre from the plant stem and breaking the long fibres into short, fluffy "cotton" after a series of baths which removes the pectines. The expensive, time-consuming "retting" process is eliminated in the conversion of such fibres, which formerly required 30 days and therefore was considered economically impracticable. This announcement followed closely a publication of Russia's plan to increase its output of actual cotton to the point where imports will be unnecessary by 1932. Development of the cotton substitute would provide cheaper textiles to augment the production of cotton goods, vast quantities of which are needed by the population.

**NEW WAY TO CLARIFY CIDER.** A method for clarifying apple cider cheaply and quickly, so that a beautiful crystal clear beverage can be obtained, was announced in April at the N. Y. State Agricultural Experiment Station in Geneva, N. Y. The principle involved in the new process is the introduction of an enzyme which decomposes the soluble pectin in cider without affecting the starches or protein. During the decomposition of the pectin insoluble substances are formed which are easily removed by filtering, together with other substances responsible for the cloudiness of the cider. The use of this enzyme has the advantage over other methods of clarifying cider that it can be added to the cider immediately after it is pressed and that the action of the enzyme is complete within ten or fifteen hours, depending upon its strength.

See VITAMINS.

**CHEQUERS CONVERSATIONS.** Conversations between British Government officials and Chancellor Brüning and Foreign Minister Curtius of Germany held in June, 1931, at Chequers, the

official residence of the British Prime Minister. See GREAT BRITAIN and GERMANY under *History*.

**CHESS.** Although another year went by without a return match for the world's chess championship between Dr. Alexander Alekhine of Paris and José Capablanca of Havana, whom Alekhine defeated in 1927 at Buenos Aires, the chess experts of the world were very active in 1931. The victory of the United States team in the fourth team tournament of the International Chess Federation at Prague in the summer was the leading achievement of the year. The Americans captured the gold cup donated by F. G. Hamilton-Russell of London, which they won in a field of nineteen countries. The United States, represented by Frank J. Marshall, J. Kashdan, L. Horowitz, Arthur W. Dake, and Herman Steiner, outranked the Polish team by one point.

Kashdan, Manhattan Chess Club champion, strengthened his claim as a master, by his work in the tournament at Bled, Yugoslavia. There he finished in a quadruple tie for fourth place although he was second to Alekhine, the winner, at the end of the first half, E. D. Bogoljubow, of Germany, was second, and Aron Nimzowitsch, of Denmark, third. A match for the American championship between Kashdan, whose fame grew constantly in 1930 and 1931, and Marshall was discussed frequently but did not materialize.

In cable matches London won the Insull Trophy from Philadelphia and the Manhattan Chess Club defeated the British Chess Club of Paris. Samuel Reschefskey, of the University of Chicago, won the Western Chess Association tournament held at Tulsa, Oklahoma, and the New York State Chess Association tournament was captured by Fred Reinfeld, of the City College of New York. Harvard retained the H.Y.P.D. College Chess League championship, with Yale second, Princeton third and Dartmouth fourth. The interclub series of the Metropolitan Chess League, New York City, was captured by the Marshall Chess Club.

**CHICAGO.** See ILLINOIS.

**CHICAGO.** THE UNIVERSITY OF. An institution of higher education and research situated in Chicago, Ill.; founded in 1890. The university is privately endowed, coeducational, and non-sectarian, although one-third of its 30 trustees must be Baptists. John D. Rockefeller founded the university, and his personal gifts amounted to a total of \$35,000,000 over a 20-year period.

The educational reorganization, announced in November, 1930, was put in effect for the entering freshman class in October, 1931. The new educational programme abolishes the traditional graduate schools and undergraduate college, substituting a divisional organization, consisting of the college, four upper divisions in arts and sciences, and the professional schools. The college is a new entity, corresponding roughly to what has been called the junior college. The four upper divisions, which have been formed by grouping of departments, are the biological sciences, the physical sciences, the social sciences, and the humanities. For details, see the NEW INTERNATIONAL YEAR BOOK for 1930. The following appointments were made from the faculty to meet administrative requirements of the reorganization: George A. Works, as dean of students and university examiner; Gordon J.

Laing, as dean of the humanities division; Henry G. Gale, as dean of the physical sciences division; Frank R. Lillie, as dean of the division of biological sciences; C. S. Boucher, as dean of the college division. Beardsley Ruml, appointed in 1930 as dean of the social sciences division, assumed that position during the current year.

During the summer quarter of 1931, a total of 4957 different students were enrolled; during the autumn quarter of 1931, the enrollment was 7013. The total enrollment for 1930-31 was 13,646 individuals. These figures do not include the enrollment in the home study or correspondence department, which has an average of 7000 students at any one time. The members of the several faculties, exclusive of assistants, numbered 1095 (including 192 in the university college) on Nov. 1, 1931. In all departments and in all grades of service, the university employed approximately 3000 persons. Important additions to the faculties during the year included the following: Alfred R. Radcliffe-Brown, as professor in the department of anthropology; Carl Bricken, as assistant professor in the new department of music; Pierce Butler, as professor of library science and acting dean in the graduate library school; and Thornton Wilder, as professorial lecturer in English.

The assets of the university as of June 30, 1931, were \$108,779,459, an increase of \$5,029,725 over the figure for the same date in 1930. These assets were divided as follows: Endowment, \$59,929,899; plan, \$36,691,009; current assets, \$3,115,041; other assets, \$9,043,506. The total income under the university's combined budget for the fiscal year 1930-31 was \$7,868,423, while expenditures amounted to \$7,841,117. Student fees provided 32 per cent of the university budget income, and endowment funds provided 42 per cent. The salary cost of instruction and research constituted 39 per cent of the budget expenditures, or \$2,115,327. The total amount of gifts paid in was \$8,020,540.

Completion of five structures during 1931 brought the number of buildings operated by the university for educational purposes to 87, including the Yerkes Observatory at Williams Bay, Wis.; the buildings of the Rush Medical College of the west side of Chicago; and the expedition headquarters of the Oriental Institute at Luxor, Egypt; Armageddon, Palestine; and Khorsabad, Iraq. These new buildings were the affiliated Chicago Lyng-In Hospital; the new residence halls for men, the graduate education building, Oriental Institute, and the field house. The new International House of Chicago, which is to be a centre for all foreign students in the Chicago metropolitan region, was under construction.

The University of Chicago Press published 107 books during 1931. This number does not include material published for the National Advisory Council on Radio in Education, nor that published for the Committee on the Costs of Medical Care. The Press also issued some 30 maps and scales. The majority of the publications were the product of original research and scholarship. Sixteen scholarly journals are also published by the Press. Accessions to the university libraries increased the number of bound volumes to 906,195, and number of periodicals regularly received to 5317. The President in 1931 was Robert Maynard Hutchins, A.M., LL.D.

**CHILD HEALTH.** See FOOD AND NUTRITION.

**CHILD LABOR.** It was apparent to social workers in the United States that children seeking employment were feeling with equal severity the industrial depression of the year. As one social worker reported, "Every employment office has for months now been crowded daily with children for whom it seems practically impossible to find work. They are children too who come, often without breakfast or carfare, and who tell an almost unvarying story of serious unemployment among older members of the family and plead for work which in many instances simply seems unattainable." Thus, in the office of Junior Placement of the New York State Department of Labor, during November, 1930, there were 3 applicants for every job available for 17-year-old boys and girls, 4 applicants for every job open to 16-year-olds, and 5 applicants for every job open to children under 16 years. It was apparent that emergency measures were needed in the case of children, too. In order to make possible the return of such young workers to the schools there was necessary the creation of emergency funds to clothe them and to keep them in shoes. Social workers were stressing the need for more and better training for children and for curriculum adjustments in the schools themselves to prevent innumerable boys and girls from suffering from lifelong handicaps as a result of the present serious emergency.

**MINIMUM STANDARDS.** In 1931, the National Child Labor Committee adopted the following minimum standards to protect children "against premature or otherwise injurious employment and at the same time leave them free for adequate education, physical development, and preparation for occupational life."

As regards children employed in non-agricultural occupations:

1. No child under 16 should be employed, except that children 14 to 16 years may work outside of school hours in light occupations. School attendance should be compulsory for the entire term for a child under 16, unless he has completed the course of study.
2. No person under 18 should be employed for longer than a 6-hour day or 44-hour week; for children between 14 and 16 years the combined hours of school attendance and employment should not exceed 8 hours a day.
3. No person under 18 years should be employed at night between the hours of 7 p. m. and 6 a. m., except that boys 16 to 18 years may work until 10 p. m. in suitable occupations.
4. No person under 18 years should be employed without a work permit based on proof of age, employer's promise of work, and certificate of physical fitness.
5. No person under 18 years should be employed in dangerous occupations.
6. Adult earning capacity should be considered as the basis for compensation in the case of minors permanently disabled; at least double compensation should be assessed against the employer of an injured minor illegally employed.

As regards children working in agricultural pursuits:

7. No child was to be employed during the hours when compulsory attendance laws required his presence in school. School attendance should be compulsory for the entire term for a child under 16 years unless he has completed the course of study available.
8. No child under 14 should be employed at any time away from the home farm.

9. No child under 16 should be employed away from the home farm for more than 8 hours in a single day; the combined hours for school attendance and such employment are not to exceed 8 hours in a single day.

10. No person under 18 should be employed in dangerous or injurious agricultural work; minors employed in agriculture should be included in the workmen's compensation law.

**LEGISLATIVE PROGRESS.** The National Child Labor Committee reported that in the 44 State legislatures meeting in 1931, no serious effort was made by any of the jurisdictions to place greater obstacles in the way of child labor as one of the means of coping with the continued unemployment situation. So, not a single State during the year raised its compulsory school attendance law or the minimum age for general employment. It is interesting to note that in Massachusetts a bill aiming at the raising of the educational requirement for work permits from the sixth to the seventh grades failed to receive a single vote in its favor. In other respects progress, however, was indicated. Notably in Alabama and North Carolina significant measures bearing on child labor were enacted. In Alabama, a law was passed raising the educational requirement for the issuance of work permits for children between 14 and 16 years to the seventh grade in September, 1932, to the eighth grade in September, 1934. An amendment to the Alabama workmen's compensation law gave injured minors illegally employed double compensation.

In North Carolina, amendments to the child labor laws provided that the 8-hour day and 48-hour week was to apply to all children under 16 with the exception of boys over 14 supporting themselves or widowed mothers. Further prohibition was ordered against the employment of children under 16 in certain specified dangerous occupations. Girls between 16 and 18 were prohibited from working in industrial plants after 9 p. m. and before 6 a. m. In Texas, the workmen's compensation law was amended to include all employed minors whether illegally employed or not and to make compensation based on future earnings.

Delaware raised the minimum age of employment in canneries from 12 to 14 years. New Jersey raised the educational requirement for work permits for children of 14 years from the sixth to the eighth grade. Pennsylvania, in company with Alabama, was added to the States granting extra compensation to injured minors illegally employed, making a total of 9 carrying such laws. In New York, a 48-hour law for women over 16 years in mercantile establishments was improved by reducing the amount of overtime allowed. However, all proposals to establish a minimum wage board for minors and women were defeated and the bill requiring at least 20 hours a week school attendance during unemployment was so weakened by amendment that the governor vetoed it.

In the New England States the National Child Labor Committee reported little child labor legislation of significance. The Federal Child Labor Amendment was introduced for ratification in the legislatures of Colorado, New York, Ohio, Oregon, Pennsylvania, Washington, West Virginia, and Wyoming, and succeeded in being adopted only in Colorado. This made the sixth State to ratify the amendment.

**CHILDREN IN HAZARDOUS EMPLOYMENTS.** The report of a sub-committee of the White House

Conference on Child Health and Protection held in 1930 presented the most complete material yet issued on the problem of children involved in industrial accidents. According to statistics available for 16 States, employing together approximately two-thirds of all the minors in the United States engaged in non-agricultural pursuits, there were occurring annually 100,000 injuries to minors under 21, from 20,000 to 25,000 injuries to minors under 18, and between 5000 and 4000 injuries to children under 16. Fully 1000 minors under 18 were each year suffering permanent disabilities and 100 were being fatally injured. In addition, a large number of children were in all probability being affected by harmful dusts, fumes, intense cold or heat with dampness, cramped postures and other fatigue. The report declared that machinery and vehicles were the principal causes of injuries to minors. Vehicular injuries accounted for a larger proportion among children under 16 years than among minors between 16 and 17 years or among older children; while machinery caused a larger proportion of injuries to young persons 16 and 17 years of age than to children under 16.

It was found that legislative prohibitions against hazardous employment, particularly as regards work on or about machines, were much less adequate for 16- and 17-year-olds than for those under 16. In all States for which information was available, it was ascertained that accidents to minors injured while illegally employed were more serious than those occurring to other minors. In some States approximately one-half of the injuries occurring to minors illegally employed at the time of injury resulted in permanent disability or death.

The earliest laws attacking the employment of minors in hazardous occupations were written on the statute books of Illinois, Massachusetts, New York, Wisconsin, and Ohio, and for the most part covered work on certain dangerous machines in the manufacture of paints, the use of dangerous acids, and the operation of elevators. It is interesting to note that in recent years slight consideration has been given to the development of new industrial conditions so that hazardous employments of late appearance are not adequately provided for. However, State departments of labor have been exercising themselves in this matter. Some 26 jurisdictions vest such powers in these offices. In 10, they are used more or less extensively. Thus, in California, a ruling prohibits the delivery of goods via motor vehicles by minors under 16; in New York, minors between 16 and 18 are not permitted to work on hazardous machines not properly guarded at the point of operation; in Pennsylvania, there is a prohibition against the work of minors in spray painting.

With reference to the question of the status of minors under compensation laws, the *American Child* in its March issue points out that more than a dozen States exclude children altogether from the benefits of the workmen's compensation law if they are injured during illegal employment, the thought being that damages for such injuries can be obtained through court action on a much more satisfactory basis than if a workmen's compensation law based on an inadequate, injured child's wage were the rule. However, more frequently than not, the injured child seems to be the sufferer as a result of such

a policy. Thus, it was found in Indiana that that was considerable ignorance on the part of the injured minors of their rights under the law. Out of 80 minors interviewed by a research assistant for the White House Conference, only seven had instituted civil suits and five others had employed lawyers who effected a compromise agreement; 62 received some indemnity, but 54 of these received no more than they would have been entitled to under the compensation act. On the other hand, 18 received no redress for their injuries. In 20 States, no distinction existed between legally and illegally employed minors suffering accidents. All such received regular compensation awards.

In view of the fact that compensation awards based on regular earnings, in the cases of children, are very small, a number of States seek to compensate injured children, particularly in cases of permanent disability, by requiring awards on the basis of probable future earnings or on the prevailing adult wage rate. Still a third practice in the treatment of injured minors is the award of additional compensation in the case of illegal employment. This is the rule in seven States, the payment varying from 50 per cent additional, to treble the regular compensation award. Says the *American Child*, in commenting on this situation:

Among these several contradictory treatments of the minor injured in industry, and particularly of the minor illegally employed, where is the greatest measure of justice to be found? To find the most effective means of preventing accidents is the only satisfactory goal. But whenever prevention fails and a child is hurt—a child who is working either under the conditions allowed by law or in violation of them—it is incumbent on the State to make sure that such a child receives whatever redress financial compensation can afford. Compensation based on the child's future earning capacity with extra compensation to the child injured during illegal employment seems to be the most effective method yet tried out.

**ILLEGALLY EMPLOYED MINORS.** The Pennsylvania workmen's compensation law makes provision only for legally employed minors in the State, compensation not being compulsory in the case of minors illegally employed. The redress to the child in such cases is through court action. A study made of all such cases occurring in 1929 indicated that 5458 minors under 17 years of age suffered injury. In the case of 502 children, illegal employment seemed to be indicated or there were evidences of preventable accident. It was ascertained that 289 of these injured minors were actually illegally employed. With respect to 198 cases, the loss of time through injury exceeded seven days. In 179 cases, compensation was paid by the insurance company, leaving 19 cases in which compensation was refused. Five of these children suffered permanent injury; 6 of the 19 obtained more than they would have received under workmen's compensation; 7 received only medical expenses; 6 received no redress. In the opinion of the State Bureau of Women and Children the exclusion of illegally employed children from the benefits of the compensation law brought them no advantage and in some cases real hardship was suffered. The Bureau urged the adoption of legislation calling for the payment of extra compensation to illegally employed children injured during work.

The Illinois law allows the granting of 50 per cent additional compensation to minors under 16 illegally employed and injured during occupation. Between July 1, 1929 and June 30,

1930, 78 such cases occurred which represented 67 per cent of the total number of compensable accidents to children under 16. It is interesting to note that the additional compensation paid was \$2344.

**EMPLOYMENT CERTIFICATES.** The Children's Bureau, on the basis of reports received from 23 States, the District of Columbia and 40 cities of 50,000 population and over in 11 other States, reported that the year 1930 showed the issuance of more than 103,000 work certificates to children 14 and 15 years old. These 103,000 children entered employment when their jobs might have been filled by older persons had the children remained in school. As compared with 1929, there was a decrease of one-third in the number of 14 and 15 year olds leaving school for work; yet in a few localities there was actually a slight increase in the number of children receiving regular employment certificates in 1930 as compared with 1929. In one large city in which about 1000 children in the two age groups received their first regular work certificates, the report officially gave the unemployment of adult members of families as the chief reason for the children in question quitting school. How serious this termination of school work was in order to enter the industrial round was indicated by the fact that in five States and 30 cities in other States less than 60 per cent of children had completed the eighth grade; while in four States and 11 cities from 30 per cent to 71 per cent had completed no grade higher than the sixth. Fully 42 per cent of the 30,000 children 14 and 15 years old, for whom the type of work was reported, entered manufacturing and mechanical industries, and 24 per cent entered mercantile occupations.

For those States and cities for which comparable information was obtainable for the two years 1929 and 1930, the number of 14 and 15 year olds entering work for the first time in 1930 showed a decrease of 34 per cent as compared with the previous year. In New York State, the decrease was 23 per cent, in Vermont, 55 per cent, in Wisconsin, 55 per cent. In six States, the District of Columbia, and 21 cities in other States requiring the reporting of issuance of work certificates to 16 and 17 year olds, it was indicated that the figures for 1930 showed a decrease of 27 per cent over 1929. In commenting on this situation the Federal Children's Bureau declared:

Comparatively few of the children whose school ties are once broken go back to school. Reduction of child labor, with its corollary, extended taxes, is urged, not merely as an aid to the unemployment situation, but because of the advantages to boys and girls themselves in enriched lives and more productive vocational training. The younger and more untrained the applicant for work, the fewer his opportunities for obtaining worthwhile employment at any time.

**INTERSTATE MIGRATIONS.** The Interstate Conference on Migratory Child Labor, held in Baltimore in February and attended by officials from the States of Delaware, Maryland, New Jersey, and Pennsylvania, adopted a report containing the following recommendations: All children under 16 working in canneries should be placed under the full protection of the State's child labor laws; all children working in industrial agriculture should be placed under the protection of laws for the purpose of safeguarding them from exploitation through excessive hours and unhealthy working conditions; double compen-

sation should apply to all injured children illegally employed; the States represented at the conference should adopt a reciprocal plan of co-operation in furnishing and recognizing data necessary for the issuance of employment certificates; States in which migratory children are employed should assume responsibility for the education of such children; the States in which children are employed should concern themselves with regulation of labor camps and canneries, particularly as regards housing and sanitation.

**MASSACHUSETTS.** The Children's Commission of Massachusetts, set up in 1929, after many hearings, prepared a report which was submitted to the 1931 legislature and which included some 40 major recommendations for revision or addition of the State's present statutes. The proposals made to the legislature with regard to child labor were the following: The centralization of the administration of health certificates in the school system, omitting the option of family physicians and placing supervision more completely in the hands of the school authorities. A recommendation to the effect that the superintendent of schools satisfy himself as to the mental fitness and ability of a mentally retarded child to perform the work indicated before the issuance of an employment certificate. A recommendation that there be furnished better proof of age as well as mandatory parental consent before the issuance of a work certificate. With regard to the work of children in agriculture, concerning whom the child labor law of the State made no specific provision, the Commission recommended the prohibition of the employment of children under 14 years in industrialized agriculture and also called for a maximum 8-hour day and 48-hour week for minors between 14 and 16 years. The Commission furnished this definition of industrialized agricultural establishments:

An agricultural enterprise conducted primarily for commercial purposes and employing more than 10 persons other than members of the family of the operator.

On this important matter the Commission went on to say:

It is submitted that there is no economic or social justification for the existence of any business which is dependent for its success upon the labor of children under 14 years of age. Also that children between 14 and 16 years should not be compelled to work as laborers in industrialized agriculture for longer hours than are legally permitted in factory employment. Children need freedom for growth and development, and should not be weighed down and their health and physical welfare seriously endangered, by employment causing excessive fatigue and overstrain.

As a result of the inquiry made by the Commission into educational requirements, there was also submitted to the legislature a bill calling for the following changes in the State's law: Raising the age of compulsory full-time school attendance from 14 to 15 years; raising the educational requirement for work permits from the sixth to the seventh grades; prohibition of the employment of minors under 15 years in all occupations covered by the child labor law; a requirement that employed minors under 17 years, instead of under 16 years, be made to attend continuation school.

**AUSTRIA.** During the last 12 years, more than 100,000 working boys and girls under 16 years of age in this country had been given vacations in country homes at the expense of their

employers. The government and the Association of Sickness Insurance Funds maintained a number of country vacation homes where vacations were spent either at no cost or for a nominal charge.

**MEXICO.** On Aug. 27, 1931, the Mexican Congress inaugurated the first federal labor law to apply to the whole country. The provisions of the new law covered all manual and mental workers and fixed the legal minimum for employment at 12 years. Children under 16 could not be employed more than 6 hours a day. Children under 16 and women were not to work overtime nor between 8 p. m. and 6 a. m., nor in employments which were unhealthful or dangerous. A list of prohibitive occupations was included in the law. Children under 16 might not be employed in places where intoxicating drinks were served nor in houses of prostitution. Schools were to be established by employers for workers' children in rural localities. Vacations with pay were required for all workers. The statute also provided for the creation of a corps of federal and local factory inspectors to enforce the law and it also fixed penalties for violations.

**EGYPT.** An investigation made by Dame Adelaide Anderson indicated that in the Egyptian cotton-ginning factories young workers were largely employed. In a large number of such plants, fully one-half of the workers were under 15 years and many were under 9 years. Hours were longer and rest periods were unregulated; wages were low; sanitary conditions were poor; and dangerous machinery was unguarded. At the heart of the child labor problem in Egypt, according to this investigation, was the lack of full provision for elementary education.

**SWEDEN.** At the beginning of the year, new legislation prohibiting the employment of workers under 18 years in certain dangerous occupations went into effect. Some 20 such occupations were listed, among which were certain processes in electric power plants, printing plants, quarries, factories manufacturing or handling explosives and poisonous substances, plants making jute, horsehair, hemp and flax, and the sorting of rags.

**JAPAN.** On Sept. 1, 1931, the provisions of the Japanese Factory Act came into full effect, and from that date the employment of young persons under 16 years of age and of women in the factories coming under the act is limited to 11 hours a day, including 1 hour's rest. Exemption had been granted certain mills permitting the continuance of the 12-hour day to that date.

A survey made in Japan in August, 1930, covering nearly 2,000,000 children who had completed the compulsory school course of six years, the results of which were made public in 1931, showed that one-half were admitted to the non-compulsory higher courses, 42 per cent were working, and 56,600 children had been unable to find work. Of the employed children, more than 390,000 were in agriculture and forestry, 122,000 in commerce, and 116,000 in factories and mines, and the rest in transportation and construction, fisheries, domestic employment, and miscellaneous occupations.

**RUSSIA.** Beginning with 1931, a decree promulgated provided for compulsory education in Russia for the first time in its history. All children between the ages of 8 and 15 were to be required to attend schools, and 60,000 additional teachers were being engaged for their instruction.

**CHILDREN'S BUREAU, UNITED STATES.**  
See CHILD WELFARE.

**CHILD WELFARE.** THE CHILDREN'S CONFERENCE. Miss Grace Abbott, Chief of the United States Children's Bureau, in reviewing the achievements of the 1930 White House Conference, and in comparing the status of child welfare in that year with the situation in 1909 and again in 1919 (when earlier such conferences were held), found much commendable progress. It was plain that there had been achieved notable advances in safeguarding the health of children (witness the declining infant mortality rate), in handling child delinquency (witness the growth of the juvenile court movement and the increasing frequency of habit clinics), in higher social work standards for the care of dependent and neglected children (witness the spread of the idea of home or foster home care), and in a greater concern being shown by public agencies in child welfare and in the maintenance of the home where the chief breadwinner had been eliminated (witness the spread of mothers' pension schemes). But Miss Abbott interposed a salutary word of caution. She said as reported in *Current History* (March, 1931):

... we must remember that a general change is only gradually effected. Many children suffer from preventable physical and emotional handicaps. Conditions which create delinquency are found in the home, the school and the community. Large numbers of children are still cared for in institutions in which they are unintelligently . . . treated, and children are still placed in fee family homes to become little slaves. . . . But a trend is toward a scientific approach to all these problems and that is the basis for hope of greater progress in the next decade.

The Child Labor Section of the White House Conference urged on the conferees that adequate consideration be given to the problems of adult unemployment, farm economics and a living wage as means of checking child labor. The report of this group in discussing a living wage declared:

Since an income earned by the chief wage earner of the family sufficient to maintain a decent standard of living is basic to a normal solution of the problem of child labor as of other problems of child welfare.

The standards set up by this Child Labor Section called for compulsory school attendance laws for children up to 16 and prohibitions against the employment of boys and girls of 16 to 17 in occupations known to be physically or morally hazardous, a working day longer than 8 hours or a week longer than 44 hours, and the end of night work.

The Child Labor Section also called for the establishment of a national minimum standard on the score that the regulation of child labor by the various States has been slow and uneven and the cause of grave injustice. This portion of the report read:

These inequalities cause injustice to children in States with low standards because they are deprived of equal opportunity with others for health, education and immunity from injurious labor; injustice to employers in States with high standards, since they must compete with employers whose labor costs are low because the labor is child labor; and injustice to all citizens in both groups of States.

The Child Labor Section recommended among other matters the following: expansion of State aid to widows and dependent children in the form of mothers' assistance acts, with grants sufficiently large for the family to maintain an

adequate standard of living; the establishment of a minimum wage scale to avoid the industrial exploitation of children; scholarship funds to keep young persons in schools who would otherwise be obliged to work; changes in school curricula to prevent the discouragement and the growth of a sense of inferiority on the part of educationally retarded children; adequate methods of administration of child labor and compulsory school attendance laws; the prohibition of the manufacture of articles in the home; the establishment of the age 16 as a desirable minimum age for child street vendors; the extension of school attendance requirements for child workers in agriculture; the supervision of labor camps by State agencies and special provisions made for migrant children; the prohibition of the employment of young persons in dangerous occupations; the extension of workmen's compensation to and increased compensation for injured minors with additional compensation for minors illegally employed, such grants to be based on future earning capacity in the case of minors permanently injured.

**THE LAW ENFORCEMENT COMMISSION'S REPORT.** Among investigations made by the so-called Wick-ersham Commission was one concerned with the child offender in the Federal system of justice, under the direction of Dr. Miriam Van Waters. Among the recommendations proposed by the surveyor was the writing of Federal legislation to recognize the status of juvenile delinquency in the case of violations of Federal law to be similar to law established in the States. The report also suggested that the States assume responsibility for court hearings and subsequent treatment. It is interesting to note that the surveyor rejected the erection of a system of juvenile courts under the jurisdiction of the Federal government not merely on the grounds of impracticability but because juvenile delinquency was largely attributable to the failure of community resources. Pending the writing of such legislation, the surveyor suggested the establishment of a service in the Attorney-General's office to furnish the supervision of children under the Federal jurisdiction, which was to include special registration by Federal or local probation officers, the use of juvenile detention homes instead of jails, cooperation with juvenile or other State courts, the extended use of probation for minors where Federal courts were required to act, and the placing on parole of young children now in penal institutions. The report (publication no. 6 of the Commission) includes chapters on the concept of juvenile delinquency, jail detention, administration of the Federal system of justice in relation to child offenders, and penal and correctional institutions to which the child offenders are sent.

**JUVENILE DELINQUENCY.** The National Probation Association, on the invitation of the New Hampshire State Board of Public Welfare, made a study of the juvenile courts and probation in the State and filed the following recommendations: the extension of probation beyond its present limit of 17 years; the establishment of a probation department within the State Board of Public Welfare, the officers attached to this to serve wherever needed throughout the State and the cost of this service to be borne by both the State and the counties involved; the creation of a part time juvenile court for each county to have jurisdiction over cases of dependent and de-

linquent children and adult cases involving children; the extension of juvenile court jurisdiction to 18 with discretionary jurisdiction continuing to 21 years.

A similar study made by the same organization of the treatment of juvenile offenders in Nashville, Tennessee, led to the following recommendations: more and better trained probation officers; reference of all cases of children to the probation department for investigation, with the making of physical and mental examinations whenever necessary; cooperation with State institutions in the supervision of children released under paroles; cooperation with social agencies in the use of their records and facilities.

ILLINOIS. A Committee on Child Welfare Legislation created by the State legislature in April, 1929, filed with the Governor of Illinois an elaborate report, earlier in the year, which covered every phase of child welfare. Incorporated in the recommendations of this Committee were some 30 bills which were presented to the Illinois legislature. The more important recommendations of this Committee follow:

Enlargement of the scope of mothers' aid. Limitation of jurisdiction to a single court in adoption cases, and requirement of 6 months' residence in the adoptive home. Repeal of the 1872 "bastardy" act and substitution of a modified form of the Uniform Illegitimacy Act, requiring the father to continue support until the child is 18 years of age. More effective and widespread supervision of child-caring and child-placing agencies by the department of public welfare. Authorization of the department of public welfare to accept guardianship for dependent children when local resources are not available to meet the need of the individual child. Revision of the juvenile court act to bring the age of boys over whom the court has jurisdiction up to 18. Mandatory appointment of one or more probation officers in each county, the State to reimburse the counties for one-half of the salaries paid. Commitment of delinquents to the department of public welfare instead of to correctional institutions, with authority in the department to provide for treatment in institutions or foster homes as each case may require. Separation of juvenile parole from adult parole. Removal of jurisdiction over juvenile cases from city and municipal courts and from justices of the peace. Creation of unpaid commission to develop policies and coordinate measures for care of physically handicapped children. Empowering school directors and boards of education to establish schools or special classes for physically or mentally handicapped children. Requirement that the department of public welfare be responsible for physical and mental examination of all children prior to commitment to any State institution. Provision for commitment of handicapped children to department of public welfare rather than to specified institutions. Mandatory establishment of an unpaid advisory county board of public welfare. Regulation of medical practice and social procedure of maternity hospitals through license from the department of public health. Licensing of all midwives in department of registration and education. Extension of responsibility of department of public health in promoting health of mothers and children. Appointment of a supervisor of child labor in department of labor to insure better enforcement of child-labor laws. Raising of minimum age for employment from 14 to 16 years with certification and safeguards in industry for all children from 16 to 18. Regulation of children employed in street trades in cities of over 50,000. Appointment of supervisors of school attendance and vocational guidance in department of public instruction. Provision for annual school census. Enforcement of duty of school systems to provide suitable education for all school children between 7 and 18 within their jurisdiction.

MASSACHUSETTS. The Children's Code Commission of this State, created in April, 1929, to investigate the laws relating to dependent, delinquent and neglected children, recommended some 60 changes in the State's law, to the Massachusetts legislature, of which 32 were adopted in the 1931 session. Among the more important enactments passed were the following: an investigation, by the State commissioners of education and of mental diseases, of the care and

supervision of mentally defective and retarded children outside of school hours; the creation of a recess committee to study the operation of the State minimum wage law; mental and physical examinations of children before commitments as delinquents; the regulation of newspaper advertisements of children offered or wanted for adoption; insurance of privacy in juvenile court proceedings and for female witnesses involved in illegitimacy proceedings and in sex crimes; the extension of the Mothers' Assistance Act to apply to all children under the age of 16.

This Massachusetts Commission made an elaborate survey of the child caring field and found that 24,000 children in Massachusetts were cared for away from their own homes in a single year; that more than 9000 delinquents were before the courts last year; that 1075 children were in the 3 State juvenile training schools; that more than 15,000 neglected children were in need of protection during the same year; that each year saw nearly 2000 children born out of wedlock and approximately 1000 adoptions; that more than 60,000 children in the State were mentally defective and retarded and that approximately 6000 were physically handicapped.

PENNSYLVANIA. At the State-wide Child Welfare Congress, held in December, 1930, there was adopted a ten-year programme of child welfare for Pennsylvania. The most important subjects of this programme were the following: The insistence upon the emphasis of the preservation of family life as the basis of child welfare; State appropriations for the Mothers' Assistance Fund sufficient to cover a waiting list (at the end of 1931, including 2500 eligible mothers) not provided for; employment of trained welfare workers and the giving of constructive family service by supervisors of the poor; a larger programme for juvenile court work, including the raising of the juvenile court age to 18 years and the establishment of a State Probation Bureau; the more effective handling of desertion through probation and individual treatment and the strengthening of the domestic relations court; study of laws relating to illegitimacy, education of the public concerning the care of the unmarried mother and her child; and a full programme for the development, education and training of mentally handicapped children.

NOTES. *Illinois.* A State-wide survey, conducted by a public commission, found more than 10,000 physically handicapped children in this State; it was also estimated that there were some 6000 others who had not been specifically located. Fully one-fourth of the physically handicapped children were post-infantile paralysis cases; tuberculosis of the spine accounted for 650 cases; accident accounted for 555 cases. The commission stated that the State required medical and surgical facilities for the rehabilitation of crippled children.

*North Carolina.* The North Carolina legislature in its 1931 session appropriated \$5000 a year for two years to establish a fund to make provision for the care in private homes of children not eligible to orphanages and not suitable for adoption. Another appropriation of \$50,000 for each year for the ensuing two years was made for mothers' aid, the amount to be matched by the counties availing themselves of this help.

*New York City.* The New York City Crime Prevention Bureau, created for the purpose of dealing with juvenile delinquency, was in 1931

made a permanent part of the New York City Police Department. The Bureau was given a staff of 182 persons made up of 60 patrolmen, 34 policewomen, and 26 social workers, among others. Among the functions of this Bureau are the investigation of dance halls, pool rooms and other places of business or amusement that are likely to exert "a destructive influence" on young people. In the same city the Department of Education made provision for the creation of a Bureau of Child Guidance. Plans were laid for the creation of a staff including psychiatrists, psychologists, psychiatric case workers and social case workers. It was planned that the Bureau was to serve as a behavior clinic for pupils of the city schools to work in cooperation with the already existing educational organizations.

**Porto Rico.** This territory, during the year, inaugurated a new vocational guidance programme to be administered by an insular board working in cooperation with the Federal Board of Vocational Education. It was planned that the leading emphasis of the programme was to be placed on agriculture and home economics. In the industrial field, instruction in the beginning was to be limited to the needle trades and the building and service industries.

**W. K. Kellogg Child Welfare Foundation.** A fund to provide for the care of mentally and physically sub-normal children, amounting to \$1,000,000 for immediate use, and with provisions for additions that may reach \$50,000,000 was created by W. K. Kellogg, of Battle Creek, Michigan. The fund was designed to furnish scientific treatment for curable cases and special training for incurables, this work to be done largely in cooperation with schools throughout the United States.

**FRANCE.** In February, 1931, there was celebrated in France the tenth anniversary of the formation of the French Central Committee on Family Allowances. It was pointed out at this meeting that there were in existence 230 compensation funds, that the personnel of the affiliated establishments totaled 1,880,000 and the amount of allowances distributed was \$13,650,000. If establishments not affiliated with compensation funds and public services were included, the annual disbursement would reach \$64,350,000 and the working population affected would approximate 4,260,000 persons. It was further indicated that the compensation funds had instituted a series of provisions for the protection of maternity and childhood, as follows: birth benefits, nursing bonuses, visiting nurses, maternal and infant hygiene services, pre-natal and post-natal consultations, dispensaries, preventoria, sanatoria, rest houses, vacation colonies, social centres, housekeeping courses, and also for the periodic family education.

**GERMANY.** A study made of the work with juvenile delinquents in Germany showed that the juvenile delinquency rate per 100,000 population of the juvenile age group was the same in 1914 (565) as in 1882 (568). Juvenile courts were not established in this country until the opening of the twentieth century; in 1923, a national system of such courts was created. It is significant to note that the post-war years up to 1924 showed a decided increase in the juvenile delinquency rate, going as high as 1137 in 1920 and 1082 in 1923. The national code of 1923 inaugurated a number

of widespread changes, the most important including the raising of the minimum age of court jurisdiction from 12 to 14 years, the termination of prosecution in certain conditions, and the general substitution of educational activities for punishment. In 1924, a further change was incorporated in the exclusion of 12 and 13 year olds from the jurisdiction of the courts. In that year the juvenile delinquency rate dropped to 812 (per 100,000 children of 14 to 17 years inclusive). In 1925, there was a further drop to 469, and for 1926 and 1927 the rate was somewhat similar.

**TURKEY.** A general public health law, enacted in this country for the first time, makes the following provision for child welfare: The establishment of child health centres in large cities; periodic physical examinations and mental tests for school children; supervision over boarded-out children under 7 years of age; protection by the state of children mistreated by their parents or guardians; pecuniary aid to families having 6 or more living children; prohibition against the employment in industry of children under 12 years of age; the forbidding of night work; a maximum working day of 8 hours for children under 16; prohibition against the employment in harmful industries of expectant mothers 3 months before confinement, and for 3 weeks before and 3 weeks after confinement, in all industries.

**CZECHOSLOVAKIA.** A juvenile delinquency law enacted in March provided that all minors from 14 to 18 years of age were to be considered as in the jurisdiction of the juvenile courts; children under 14 and mental defectives between 14 and 18 years were not to be deemed responsible for crimes committed by them, a board of guardians being empowered to take necessary measures for their education and correction. After investigation, the juvenile court was to exercise probationary supervision over the delinquent in his own family, if the home circumstances were deemed favorable. If these, however, were proved to be unsatisfactory, the court might place out the delinquent or confine him in an institution. Physical and psychiatric examinations were provided for and the juvenile court was also charged with the care and supervision of siblings of the delinquent if the facts showed they were in moral danger. The probationary period was to terminate in the twenty-first year. To supervise the law, provision was made for the creation of a juvenile court to be attached to each district court. Each court, too, was to be furnished with a social worker who had experience in child welfare work.

**ITALY.** The new penal code, effective July 1, 1931, contained the following child welfare provisions: the raising of the age of responsibility for juvenile offenders from 9 to 14 years; the commitment to a reformatory or placing on probation of children under 14 years who had committed crimes; the same provision to apply to children between 14 and 18 years if it was proved that the criminal acts were committed by the offenders without their appreciating their significance. This new code also provided for a system of probation for both juveniles and adults.

**GREAT BRITAIN.** On February 18, the British House of Lords rejected the bill raising the school leaving age in England and Wales from 14 to 15 years. The House of Commons bill provided that the measure was not to go into ef-

fect until additional legislation had been enacted for the purpose of furnishing aid to the non-provided (church) schools in meeting its requirements. The House of Lords took its step largely because of the fact that complete provision had not been made for these church schools.

**CHILE**, ché'la, or ch'i'l. A South American republic, occupying the Pacific coastal region from Peru to the southernmost point of the continent. Capital, Santiago.

**AREA AND POPULATION.** With the extreme length of 2628 miles and an average width of 177 miles, Chile had a total area of 290,119 square miles. The population at the census of Jan. 1, 1931, was 4,264,819, compared with 3,742,799 at the 1920 census. With the exception of a small number of nomadic Fuegians in the south, about 100,000 Araucanians, and the Changos of the northern coast region, the people are of European descent. There were 120,436 foreigners in the country in 1920. The chief cities, with their 1931 census populations, are Santiago (538,144) and Valparaíso (191,494). In the same year Viña del Mar had 52,871 inhabitants. Other cities, with the estimated population in 1929, are: Antofagasta, 84,221; Concepción, 70,645; Temuco, 44,000; Talcagüano, 39,770; Valdivia, 39,905; Iquique, 36,547; Talca, 37,033; and Magallanes (Punta Arenas), 32,268. The average annual births from 1926 to 1930 totaled 171,508 and deaths 106,124. In 1930 the birth rate was 40 per 1000 of population and the death rate 24.2.

**EDUCATION.** By a decree of February, 1928, education is free and compulsory for children from 7 to 15 years of age. The education system was drastically reorganized during the years 1928-30; about 600 modern primary schools were constructed, and intensive adult education reduced illiteracy from 60 to 20 per cent. The enrollment in 3629 state primary schools in 1929 was 434,124. In 1928, there were six public normal schools, with 1447 pupils; 151 public and private secondary schools, with 49,291 pupils; and 12 public commercial schools, with 3715 pupils. The State University of Chile (2700 students in 1928), the Catholic University (2000 in 1927), the National Institute of Santiago, and various provincial lyceums and colleges provide advanced and professional instruction.

**PRODUCTION.** Chile is divided into three economic zones, the northern mineral regions, the central agricultural area, and the southern pastoral and lumbering zone. While agriculture and stock raising are the main supports of the population, the mining industry furnishes nearly 90 per cent of all Chilean exports as well as funds for most of the imports. Manufacturing is rapidly increasing in importance in the central and southern areas. Foodstuffs, wearing apparel, leather, chemicals, and textiles are leading manufactured articles.

Farm holdings in Chile in 1930 numbered 210,736, with an average value of 28,800 pesos (about \$3450). Agricultural land (1927) totaled 59,038,055 acres, of which about 6,218,000 acres were under crops, 273,907 acres were devoted to fruits and vines, and 32,557,067 acres were meadow land. Forests and woods covered 11,231,685 acres. Cereals, wine, fruit, vegetables, and tobacco are the principal crops.

Preliminary results of the 1930 livestock census, with the percentage of increase since 1925 given in parentheses, were: Cattle, 2,322,633

(21.1); sheep, 5,855,370 (43); goats, 750,879 (110.3); swine, 327,553 (32.8); horses, 411,461 (27.2); mules, 30,993 (22.9 per cent decrease); asses, 36,444 (33.2). Wool production in 1929 totaled 32,500,000 pounds.

Chile's annual mineral output is valued at two-thirds that of the entire mineral production of the continent. Huge nitrate deposits in the rainless northern provinces, estimated at over 3,000,000,000 tons, constitute the most valuable mineral resource. In 1930 the industry gave employment to 65,000 persons. On July 21, 1930, all nitrate companies operating in Chile, including important American and British interests, were merged in the Chilean Nitrate Company (Cosach). The merger was instituted by the Government primarily for the purpose of restoring the industry's prosperity through the restriction of production. The output in 1929 was 3,237,594 metric tons. In lieu of export duties, the Government was to receive 180,000,000 pesos (about \$22,000,000) in 1931, \$20,000,000 in 1932, and \$17,500,000 in 1933. After this three-year period, the Government was to rely upon its dividends on 15,000,000 ordinary shares of 100-pesos par value stock, or half the total capitalization. Cosach was understood to have been financed by a \$45,000,000 loan floated in New York in the spring of 1931. An effort to establish a cartel between Cosach and the European producers of synthetic nitrogen broke down July 15, 1931, following a meeting at Lucerne, Switzerland. Chile subsequently resumed open-market sales, which had been ended two years earlier through an agreement with synthetic producers. See FERTILIZERS.

The iodine output constitutes about 80 per cent of the world's supply. Production of the principal minerals in 1930, with comparative figures for 1929 in parentheses, was as follows: Nitrate, 2,200,000 metric tons (3,238,000); copper, 597,427,000 pounds (668,402,000); coal, 1,435,000 metric tons (1,508,000). The 1929 output of iron ore was 1,812,000 metric tons; iodine, 3,052,000 pounds; silver, 1,570,000 fine ounces.

In 1927, there were 9093 manufacturing establishments, compared with 7068 in 1925. In the latter year, the gross value of manufactures was 1,493,252,043 pesos (1 peso equals \$0.1217 at par) and 89,278 workmen were employed. The first airplane produced by a Chilean factory was christened Jan. 1, 1931.

**COMMERCE.** The world-wide depression was reflected in Chile by a 30 per cent decline in foreign trade in 1930, as compared with 1929. For the first time since 1919 there was an unfavorable merchandise balance of trade. Imports in 1930 amounted to \$168,833,000 (preliminary figure), or 13 per cent below the 1929 imports of \$193,102,000. Exports, totaling \$160,417,000, were 42 per cent below 1929, when they were valued at \$275,304,000. Nitrate, iodine, and copper comprised 80 per cent of all exports in 1930 and 85 per cent in the previous year. The value of nitrate shipments declined from \$114,876,000 in 1929 to \$71,671,000 (37.6 per cent); of copper ingots, from \$105,488,000 to \$53,658,000 (49.2 per cent); of iodine, from \$9,495,000 to \$2,371,000 (75 per cent); wool, \$7,886,000 to \$3,627,000 (54.1 per cent); copper ore, \$6,065,000 to \$1,899,000 (68.7 per cent).

Although imports from the United States declined 10 per cent, from \$62,775,000 to \$56,609,000, and exports to the United States fell off

42 per cent, from \$70,246,000 to \$40,790,000, the North American republic in 1930 continued to dominate Chile's export and import trade. Germany displaced Great Britain as the second important source of imports. Exports in 1931 totaled 926,400,000 pesos and imports 708,900,000 pesos, according to preliminary returns.

**FINANCE.** The Government reported a deficit of 71,156,094 pesos (about \$8,540,000) in the ordinary budget for 1930, excluding 5,145,101 pesos (about \$617,400) expended in purchasing bonds for the "emergency fund." The nominal accumulated surplus of 77,622,402 pesos carried over from preceding years (it included about 75,119,416 pesos of uncollectible loans and debts), when added to the actual revenue for 1930, left a nominal balance of 1,321,207 pesos (about \$158,500) in excess of all ordinary expenditures. Ordinary revenues were 1,055,189,133 pesos (about \$126,600,000), as compared with the budget estimate of 1,169,650,000 pesos; ordinary expenditures, including emergency fund bond purchases, were 1,131,490,328 pesos (about \$135,720,000), as compared with the 1,159,323,798 pesos authorized in the budget.

Expenditures under the extraordinary budget, public-works programme, and other special laws during 1930 amounted to 535,084,734 pesos, or 46,611,113 pesos less than provided for. Applying 25,020,307 pesos of this amount to cover the overdraft in the same accounts left at the end of 1929, there remained 21,581,806 pesos (about \$2,589,000) of uninvested balance under the extraordinary budget and special laws.

In the budget for 1931, ordinary revenues were estimated at 1,039,617,387 pesos (about \$124,754,000) and ordinary expenditures at 1,039,159,914 pesos (about \$124,699,000). The extraordinary budget for 1931 provided for an expenditure of an additional 275,848,333 pesos (about \$33,096,000).

An official statement by Premier Blanquier July 18, 1931, placed the deficit for the year to that date at 39,000,000 pesos (about \$4,720,000). He estimated the deficit for the entire year at 145,000,000 pesos (about \$17,500,000).

On July 18, 1931, Premier Blanquier announced that the total national debt stood at 4,500,000,000 pesos (about \$547,000,000), and that interest and sinking fund requirements amounted to 311,000,000 pesos (about \$37,800,000). On July 15, 1931, the Government declared a moratorium on the foreign debt, in order to prevent the further depletion of the Central Bank's gold reserves. Interest and sinking fund payments were to be paid into local banks in Chilean currency until conditions improved. On August 19, however, the Cabinet ordered that these payments be also discontinued, making the moratorium complete.

**COMMUNICATIONS.** Railway lines in operation in 1930 totaled 6831 miles, of which nearly 70 per cent were state owned, 22 per cent British owned, and the remainder represented American investment. A railway construction programme inaugurated in 1928 called for the completion of 559 additional miles of track within six years at a cost of \$22,143,000.

In 1931, there were about 24,414 miles of highway, including 20,045 miles of unimproved earth, 3878 miles of improved earth, and 358 miles of macadam roads. A large proportion of the earth roads were impassable during the rainy season. There are also 851 miles of navigable

rivers and 491 miles of navigable lakes. Service on the highly developed air-line network was curtailed in 1931 due to financial stringency. In August, 1931, Pan-American-Grace Airways obtained permission from the Government to extend its passenger service direct from Panama to Santiago, Chile. Formerly it was necessary to transfer passengers at the border to planes of the government-operated lines.

**GOVERNMENT.** Under the Constitution of Oct. 18, 1925, executive power is vested in a president, assisted by a cabinet responsible to him, and legislative power in a national congress, consisting of a senate of 45 members, and a chamber of deputies of 132 members, elected by the departments. By an agreement of political parties, however, the 1930 election to fill half the seats in the Senate and the entire Lower Chamber was waived and the vacant seats were filled through selection by the various parties. The President, who is elected for six years, is ineligible to succeed himself. President at the beginning of 1931, General Carlos Ibañez del Campo, who became virtual dictator in 1926 and assumed the Presidency July 21, 1927. Under his régime the Cabinet was non-political, with the Minister of the Interior as the nominal head. For changes in the government in 1931, see below under *History*.

#### HISTORY

**IBAÑEZ OVERTHROWN.** Aggravated by the increasingly acute economic and financial crisis, political unrest under the virtual dictatorship of President Ibañez reached a climax in July, 1931, and he was forced to resign (July 26) after three days of severe rioting in Santiago. While angry mobs shouted for his detention and trial he fled by special train to Argentina early the following morning. He was the first Chilean President to vacate his office without constitutional sanction.

With his elimination there passed from the political scene, at least temporarily, one of the most capable administrators and statesmen of Latin America. Honest, hard-working, and patriotic, he had striven vigorously and effectively against the opposition of the rich landowners to improve the economic and social status of the middle, agricultural, and laboring classes. His reforms, however, were imposed from above at the expense of the civil liberties and the constitutional traditions of the people. He stifled all opposition, hand-picked the members of Congress and of the government services, imposed a press censorship, and in 1930 dispensed with direct suffrage in the Congressional elections. Military men played the predominant rôle in his government. The necessities of dictatorship resulted in the increase in the army from 30,000 men in 1924 to 70,000 in 1930 and a rise in military expenditures to \$50,000,000 annually. Ibañez early in his régime inaugurated a huge programme of public works, financed mainly in the United States, which increased the foreign debt from about \$125,000,000 in 1925 to about \$547,000,000 in 1931 (see above under *Finance*) but did not prove as profitable as anticipated.

It was the particularly acute repercussions in Chile of the world-wide economic depression that brought the dissatisfaction with his régime to a head. With the gradual collapse of the prices of nitrate, copper, and other exports to a point lower than the cost of production, the economic

structure of the nation was virtually wrecked. Government revenues, the profits of entrepreneurs, salaries, and wages all shrank to a fraction of their normal levels. Trade stagnated, foreign credit was curtailed, the exchange value of the peso declined to a point requiring shipments of gold reserves, and the condition of the currency and banking systems became alarming. Unemployment and suffering made it easy for liberals and radicals to fan the flame of political discontent. General Ibañez retained to the end the support of the bulk of the army and navy. But he stepped down when he saw that he could maintain his position only at the cost of civil war.

From the beginning of the year 1931, the President and Congress, then in extraordinary session, grappled with the problem of staving off financial insolvency. When Congress on February 10 recessed until May 21, it vested the President with extraordinary powers pending its reassembling. In the interval, Ibañez issued some 150 decrees with full legislative effect, including measures establishing a censorship and drastically reducing the salaries of government employees. A reorganization of the Cabinet on April 28, was followed by a decree increasing the extraordinary budget by 25,000,000 pesos (about \$2,800,000), of which 18,000,000 pesos were for military and naval expenditures. A number of the President's prominent political opponents were deported during May.

The return to Argentina early in July of Arturo Alessandri, the former President of Chile who had been living in exile in Paris, served to indicate the widespread belief that a political crisis was at hand. On July 9, Minister of Finance and acting Premier Armando Jaramillo resigned when his financial proposals were declared unacceptable. President Ibañez called on Francisco Garcés Gana, president of the Central Bank of Chile, to form a new cabinet. The banker failed to secure the necessary support and on July 12 the President turned to Pedro Blanquier, who formed a Ministry the following day, with himself as Premier and Minister of Finance. Premier Blanquier on July 16 ended the press censorship for the first time during the Ibañez régime and promised a return to strict observance of civil rights. Two other significant developments occurred the same day. Nitrate prices on the New York market broke \$4.50 a ton following the failure the previous day of negotiations for an agreement between synthetic and natural nitrate producers (see above under *Production*). And the Government announced the termination of remittances on the foreign debt pending a financial turn for the better.

The Blanquier Cabinet lasted only a week, resigning July 21 due to a difference of opinion with President Ibañez over the programme of economy to be inaugurated. The Cabinet's reforms died with it. Francisco Garcés Gana again essayed to form a ministry and this time succeeded (July 22). The fall of the Blanquier Cabinet was marked by minor clashes between the police and crowds on the streets. The Cabinet of Garcés Gana, too, gave up the ghost after an existence of 24 hours, during which students at the National University barricaded themselves in, in protest against the Ibañez régime. The crowds in Santiago had begun to

wreck street cars and demonstrations were reported from Temuco, Valparaíso, and other cities. Garcés Gana was succeeded immediately by Naval Captain Carlos Froedden, a close friend of the President.

Repeated clashes between the police and street crowds, in which hundreds were injured and an undetermined number killed, continued for three days previous to the President's resignation. Two students were killed when police stormed the barricaded University buildings. Strikes were inaugurated by many workers and professional men. Stores were looted by rioters. Then with the news of the President's resignation, the sullen and defiant crowds went into transports of joy.

**AFTERMATH OF THE DICTATORSHIP.** Upon his resignation, President Ibañez delivered the government to Pedro Opazo, President of the Senate, in accordance with provisions of the Constitution, and a new Cabinet was formed headed by Juan Esteban Montero. A relative of the ex-President by marriage, Opazo proved unpopular with the crowds. Hostile demonstrations forced him to resign July 27 and Juan Esteban Montero became Vice President and acting President. The same day a resolution passed by the Senate and Chamber of Deputies declared the Presidency vacant, a situation which under the Constitution called for a Presidential election within 60 days.

The Government declared a four-day moratorium upon the collapse of the Ibañez régime and banks remained closed until July 30. By July 28, however, order had been restored, stores were open, and the demonstrators had returned to work. Two main tasks confronted Acting President Esteban Montero—the holding of Presidential elections and the restoration of the country's business and financial stability.

**THE PRESIDENTIAL ELECTION.** In the election of October 4, Señor Montero was elected, defeating former President Arturo Alessandri by a close vote. Señor Montero, a lawyer and professor in the University of Chile, was the candidate of a coalition of the Conservative, Liberal, Republican, and Radical parties, representing the students and the professional and business interests. Señor Alessandri, on the other hand, was supported by the laboring classes who dominated the Socialist, Democratic, Communist, and other Left-wing parties. The latter campaigned on a programme of strict regulation of foreign capital in Chile and of opposition to the Cosach nitrate combination (see above under *Production*). Upon his nomination, Señor Montero resigned as Provisional President (August 17) and was succeeded by Manuel Trucco, former director-general of Chilean railways. Rioting and street fighting marked the election, casualties being estimated at 10 killed and more than 50 wounded. Hundreds more were arrested.

President Montero was inaugurated Dec. 4, 1931. Meanwhile a new Cabinet had been installed (November 15), headed by Marcial Noria as Minister of Interior and including: Minister of Finance, Luiz Izquierdo; Foreign Affairs, Carlos Balmaceda; War, Gen. Carlos Vergara; Marine, Admiral Enrique Spoerer; Education, Santiago Labarco; Justice, Luis Gutierrez; and Agriculture, Joaquin Prieto.

**THE "RED" NAVAL REVOLT.** The course of the Presidential campaign was marked by a serious revolt of the naval forces coincident with a

Communist-led movement in the larger cities for the establishment of a Soviet republic. Mutinous sailors, joined by a few officers, took control of that part of the fleet at Coquimbo on September 1. Their demands included the maintenance of their pay schedule, which was to have been reduced, the return of former President Ibañez for trial, a levy upon the rich to balance the budget, the seizure of large estates for distribution among workmen, and a public works programme to reduce unemployment. The Coquimbo rebels were joined the next day by the remainder of the fleet and the coast defense force at the Talcahuano naval base. Communist agitation was rife in Santiago and Valparaíso and the police were temporarily powerless to maintain order. The Provisional Cabinet resigned on the night of September 2, and a special session of Congress declared a state of siege, with Acting President Trucco in control.

The rebels rejected conciliatory advances made by the Government and on September 5 Government forces recaptured the naval base at Talcahuano, after sanguinary fighting in which the casualties were reported at about 300. The guns of the Talcahuano forts were then trained on mutinous ships in the harbor, which were ordered not to weigh anchor. Mutinous garrisons of the Valparaíso forts were next captured. In the meantime, however, the larger ships stationed at Talcahuano had joined the main fleet at Coquimbo. This fleet was attacked by between 80 and 100 Government airplanes on September 6. Unable to reply to machine-gun and bomb attacks from the air, the vessels of the fleet surrendered one by one, the flagship capitulating the following day. The Communist and radical agitation on land had previously been stamped out by the arrest of numerous ringleaders, and the mobilization of a volunteer civil guard of 10,000.

A mixed army and navy court commenced an investigation into the revolt on September 9 and on September 18 and 19 ten sailors and petty officers were sentenced to death, nine were sentenced to life terms, and a score of others were sentenced to varying terms in prison. On October 8, Rear Admiral Roberto Chaupluzau, commandant of the Talcahuano naval base at the time of the revolt, and six captains and four commanders were dismissed from the service for their part in the revolt. Communist rioting broke out again in Northern Chile toward the end of December, but was ended after 20 rioters and police had been killed.

**OTHER DEVELOPMENTS.** Efforts of the Government to stimulate a revival of business met with little success during the remainder of the year. A committee to control foreign exchange operations was established by the Government in August. It succeeded in balancing more evenly the inflow and outflow of exchange, but the problem of maintaining the exchange rate of the peso remained and in October a special session of Congress was convened to consider tariff and budget legislation. On October 24 the Mixed Commission of Congress recommended a moratorium in the payment of all banking, legal, and private obligations. The government commission appointed to investigate the régime of President Ibañez on November 6 recommended the dissolution of Cosach, the nitrate trust, unless changes were made to take the industry out of the hands of foreigners. Neither proposal was adopted by

the end of the year. The Finance Minister on Dec. 8, 1931, announced that the Government would give qualified support to the Cosach company.

In the field of foreign affairs, the outstanding development of the year was the move made by Foreign Minister Antonio Planet for an economic conference of Latin American republics, to which the United States was not invited. The so-called "Planet plan" was submitted to the various Latin American governments on June 23 by the Chilean government. It envisaged a conference within a few months to consider such broad problems as a customs union, and joint action to promote the financial and economic rehabilitation of the various countries, the reduction of armaments, and the solution of social problems. The plan for a special conference independent of the Pan American Union was opposed by President Olaya Herrera of Colombia and others and the overthrow of the Ibañez régime in July marked the end of the proposal. Tariff difficulties between Chile and the United States were settled Sept. 28, 1931, by a *modus vivendi* giving the United States most-favored-nation status until a new commercial treaty could be drawn up. Ratifications of an arbitration convention signed by Chile and Colombia Nov. 16, 1914, were exchanged Feb. 14, 1931. D. Emilano Figueroa (q.v.), president of the Central Bank of Chile and former President of the Republic, was killed in an automobile accident in Santiago May 16, 1931. See NAVAL PROGRESS.

\* The "three eastern provinces," Liaoning (Fengtien), Kirin, and Heilungkiang, constitute the geographical region referred to as Manchuria.

\* Dependencies.

an area of over 4,300,000 square miles, or nearly that of the United States and Mexico combined, and a population variously estimated from 442,000,000 to 485,000,000, or about one-fourth of the population of the earth. The 21 provinces of China proper and Manchuria embrace less than 1,900,000 square miles, but contain 435,000,000 of the population, while the remaining 2,300,000 square miles supports less than one-fortieth of the total inhabitants. The area and population by provinces and dependencies is shown in the table on page 193 from the *U. S. Commerce Yearbook* for 1931, compiled from the 1930 report of the Chinese (Nanking) Minister of the Interior. Capitals of Provinces are in parentheses.

The 1930 estimate of the Minister of Interior placed the total area, including Sinkiang (Chinese Turkestan), Mongolia, and Tibet, at approximately 4,300,000 square miles, of which about 1,897,000 square miles comprised China proper, and the total population at 474,821,000. As no general census has been taken, the above figures are but rough estimates. The Chinese Maritime Customs estimated the total population in 1928 at 451,842,000, inclusive of 19,290,000 in Manchuria, while the 1925 estimate of the Chinese Post Office was 485,508,000. Estimates for the chief cities show similar divergencies. Those of the Chinese Post Office follow: Shanghai area, 3,150,000; municipality of Greater Shanghai, 1,713,000; the International Settlement of Shanghai, 1,008,000; the French concession in Shanghai, 435,000; Peiping, 1,402,000; Tientsin, 1,000,000; Canton, 900,000; Chungking, 625,000; Changsha, 550,000; Chengtu, 550,000; Nanking, 525,000; Tsinan, 500,000; Soochow, 500,000; Hankow, 490,000; Hanyang, 450,000; Hangchow, 425,000; Shenyang (Mukden), 400,000; Foochow, 380,000; Amoy, 300,000; Kiaochow, 300,000; Dairen, 250,000; Wuchang, 250,000; Harbin, 225,000.

Foreigners in China in 1929 were estimated by the Customs authorities at 356,233, including 245,634 Japanese, 73,476 Russians, 11,612 British, and 6966 Americans. Chinese residing abroad (1928) were estimated at about 6,240,682, including 1,456,200 in British Malaya and the South Sea Islands. Confucianism, Buddhism, and Taoism are the three indigenous religions, with Buddhism predominant. Mohammedans, found in every province, are estimated to number about 20,000,000. In 1923 there were 2,208,800 native Roman Catholics and in 1920, 618,601 native Protestants.

**EDUCATION.** The educational system in 1931 was being reorganized on the French model, wherever possible. It was estimated (1931) that about 10,000,000 children and adults of both sexes were attending educational institutions of all grades. In 1923, the lower primary schools, numbered 167,076, with 5,814,375 pupils, and higher primary schools numbered 10,236, with 582,579 pupils. There were nine government universities and various private institutions of higher learning. The numerous Christian missions, schools, colleges, and universities at Shanghai and other ports enrolled about 500,000 students, including more than 4500 students majoring in professional or semi-professional studies in institutions of university rank.

**PRODUCTION.** China has an estimated area of 192,060 square miles of arable land, divided into small holdings averaging about two acres and supporting directly about four-fifths of the popula-

tion. Production is on a highly intensive basis, there being from two to four crops annually. The republic is the world's largest producer of rice, soy beans, tea, and tung oil, ranks second to Japan in the production of raw silk, and third or fourth in cotton and wheat. Wheat, barley, maize, millet, peas, and beans are chiefly cultivated in the north and sugar, rice, tea, and indigo in the south. Fruit and fibre crops are important. The estimated average annual production of the leading crops, with the percentage exported in parentheses, was given by the *Commerce Yearbook* (1929) as follows: Wheat, 300,000,000 bushels (none); rice, 800,000,000 bushels (none); corn, 100,000,000 bushels (none); peanuts, 600,000 tons (33 per cent); soy beans, 5,000,000 tons (65 to 80 per cent); kaoliang, 200,000,000 bushels (1 per cent); tea, 800,000,000 pounds (15 per cent); tobacco, 500,000,000 pounds (6 per cent); silk, 42,000,000 pounds (48 per cent); cotton, 2,500,000 bales (10 per cent). Yields of the principal crops were smaller than usual in 1931. Cotton production declined about 20 per cent and the rice crop was reported 15 to 20 per cent below average. Low agricultural prices, civil strife, bandit depredations, rising transportation costs, floods, and exchange and currency fluctuations during 1930 and 1931 reduced the income of China's great agricultural population, which is normally close to the level of subsistence. Pigs are raised everywhere and pig bristles are an important export. Due to the occupation of great areas of virgin land in Manchuria (q.v.) by millions of Chinese settlers, the agricultural production of China as a whole is rapidly expanding. See AGRICULTURE under *World Agriculture*.

The process of industrialization is proceeding rapidly in the larger cities. The chief manufactures are cotton and woolen cloth, silk filatures, flour, iron products, and glass. There were (December, 1929) 127 cotton mills in China (43 Japanese-owned, 81 Chinese-owned, and 3 British-owned), with a total of 3,969,522 spindles and 29,322 looms. There were about 150 modern flour mills, 50 of them in Manchuria. Large iron works are located at Hanyang, near Hankow. Glass factories number about 400. Cigarette factories in Shanghai employed about 30,000 workers. According to an estimate of the Ministry of Industry issued Aug. 7, 1931, approximately 200,000,000, or nearly half the total population, were wholly or partially unemployed.

Coal deposits are widely scattered throughout China proper, the fields covering an area of 133,513 acres and the annual output totaling about 25,000,000 tons. There are large iron-ore deposits, production from which averages about 1,500,000 tons annually. Petroleum is being exploited on the Upper Yangtze and oil shale in South Manchuria and Shansi Province. Copper and tin are mined in Yunnan, the tin output being about 10,000 tons annually. More than 60 per cent of the world's total production of antimony is supplied by China, which has a normal output of 25,000 tons. The country ranks second in production of tungsten and fourth in tin. Gold, silver, lead, wolfram, molybdenum, bismuth, and salt are worked also. Salt production is estimated at 3,122,307 metric tons annually.

**COMMERCE.** Despite the world-wide depression and widespread domestic disorder, the total value of China's foreign trade in 1930 was the largest recorded, except for the peak year of 1929. The

1930 total of 2,204,600,000 haikwan taels (a gold value of \$1,014,116,000 at the average exchange value for the year of \$0.46 for the haikwan tael) was 3.5 per cent less than in 1929, when the total was 2,281,457,000 taels (\$1,460,132,000 converted at \$0.64, the average tael value for 1929). Exports declined by 12 per cent from 1,015,687,000 taels (\$650,040,000) in 1929 to 894,844,000 taels (\$411,628,000). Imports showed an apparent increase of 3.4 per cent from 1,265,779,000 taels in 1929 to 1,309,756,000 taels. When converted to gold values, however, the respective totals were \$822,756,000 and \$602,498,000, or a 26.7 per cent decline. Exports and imports of gold and silver, not included in the above figures, were valued at 159,799,000 taels.

Japan (including Korea) was again China's leading source of supply in 1930, furnishing 24.6 per cent of all imports, as compared with 25.2 per cent in 1929. The United States supplied 17.5 per cent of the 1930 imports (18 per cent in 1929); Hong Kong, 16.4 (16.7); British India, 10 (4.3); Great Britain, 8.2 (9.3); Germany, 5 (5.2); and the Netherland East Indies, 3.6 (4.3). Japan was also China's principal customer, purchasing 24.2 per cent of the total exports (25.2 per cent in 1929). The United States purchased 14.7 per cent of the exports (14 per cent in 1929); Hong Kong, 17.7 (17.1); Great Britain, 7 (7.3); and Germany, 2.6 (2.2). During the last half of 1931, however, Japanese trade with China was reduced approximately 60 per cent as a result of the Chinese boycott (see JAPAN under *History*). Much of the merchandise trade credited to Hong Kong was transshipped there to or from the United States, Great Britain, and Germany.

Beans, raw silk, eggs and egg products, cotton yarns, and textiles, wood oil, millet and kaoliang, raw cotton, tea, peanuts, and bean oil, in the order mentioned, were the most valuable export products in 1931. Exports of beans and raw silk were valued at 111,787,000 and 109,108,000 haikwan taels, respectively, compared with 164,740,000 and 147,681,000 haikwan taels in 1929. Leading imports, in order of value, were cotton and cotton manufactures, 281,515,000 haikwan taels (279,590,000 in 1929); rice and paddy, 121,234,000 taels (58,981,000); sugar, 85,635,000 taels (94,034,000); mineral oils, metals and minerals, iron and steel products, machinery and electrical equipment, leaf tobacco, wheat flour, cigarettes, and fish and fish products.

The unfavorable balance of trade, amounting to 504,912,000 haikwan taels (\$190,860,000) in 1930, is partly offset by the large remittances to China from Chinese living overseas. Preliminary returns for China's foreign trade in 1931 placed the total at about 1,427,000,000 haikwan taels, imports amounting to 887,000,000 taels and exports to 540,000,000 taels (1 haikwan tael equalled \$0.36 in 1931).

**FINANCE.** Revenues of the Central government for the fiscal year ended June 30, 1930, totaled 438,000,000 yuan dollars and expenditures 539,000,000 yuan dollars (yuan dollar averaged \$0.4545 U. S. currency in 1929 and \$0.4142 in 1930), according to a somewhat obscure statement of the Minister of Finance issued in March, 1931. The deficit of 101,000,000 yuan dollars was met by government borrowings of the same amount. It was the third consecutive year in which Nanking had faced a heavy deficit; in 1928-29 the deficit was 80,000,000 dollars. Mil-

itary expenditures absorbed 245,000,000 yuan dollars, or nearly half of the total spent in 1929-30, and the service of loans took another 159,000,000. The chief revenue items, in yuan dollars, were: Customs revenues, 275,000,000; salt gabelle, 122,000,000; rolled tobacco tax, 36,000,000.

For the fiscal year ending June 30, 1931, for which budget estimates balanced at 539,000,000 yuan dollars, Finance Minister Soong estimated in March, 1931, a deficit of 143,000,000 yuan dollars. The renewal of military activities in the spring, however, undoubtedly increased the final deficit. For the fiscal year 1931-32, Minister Soong anticipated revenues of about 500,000,000 yuan dollars, expenditures of 640,000,000, and a deficit of 100,000,000. The deficit was to be covered by an internal loan and additional taxation. Military expenditures constituted 87.5 per cent of the total estimated budget expenses.

China's foreign indebtedness was estimated by Arthur G. Coons at £205,341,100 (\$995,904,335) on Jan. 1, 1926. The *Statesman's Year Book* (1931) placed the total at £104,350,000 (about \$507,141,000) on Jan. 1, 1929, and the internal debt on July 1, 1930, at 551,753,523 yuan dollars (about \$228,525,000 U. S.), of which 196,004,860 yuan dollars represented loans issued by the former government at Peking and 354,748,663 dollars loans raised by the Nanking government. Arrears of principal and interest on the Peking issues totaled about \$104,820,000 U. S. on Jan. 1, 1929. The collapse of silver prices in 1930 and 1931 tended to increase the national indebtedness, as about 75 per cent of it was payable in terms of foreign gold currency, while for the most part revenues were collected in silver. To remedy this situation, the Nanking government on Feb. 1, 1931, established a gold basis for the assessment of customs duties and, later in the spring, customs gold unit notes, with a par value of \$0.40 in U. S. currency, were issued for use in the payment of customs imposts.

**COMMUNICATIONS.** At the beginning of 1930 there were 14,192 miles of railway line in China and Manchuria, divided into 12 principal systems. Fourteen government-owned lines (excluding the important Peiping-Hankow and Lunghai railways and new lines in Manchuria) reported gross earnings of 104,889,352 yuan dollars during 1930 (1 yuan dollar exchanged at \$0.2992 in 1930), compared with 103,819,746 yuan dollars in 1929. Highways passable to motor traffic in 1930 extended about 34,810 miles, of which 1072 miles were macadam and 33,738 miles were improved earth roads. Air-mail services between Shanghai and Peiping and air-passenger and mail services between Shanghai and Ichang on the middle Yangtze continued in operation during 1931. An air-mail line from Shanghai to Manchouli on the Siberian border was opened June 1, 1931, cutting the time to Berlin to eight days. Most of China's internal trade, however, passes over the numerous rivers and canals. Telegraph lines, totaling 52,050 miles, connect the principal cities and extend to neighboring countries. Commencing May 15, 1931, 21 government radio stations in as many cities operated international services transmitting through Shanghai, direct to San Francisco, Berlin, and Paris. During 1929, 186,514 vessels of 154,667,910 tons entered and cleared Chinese ports.

**GOVERNMENT.** The "Organic Law of the Nationalist government of the Republic China" was

promulgated Oct. 4, 1928, by the Executive Committee of the Kuomintang party, which exercises all political power and which assumed control and supervision of the new system of government. The law provided for the establishment of a state council as the highest unit of the National government, composed of from 12 to 16 members, from whom the presidents and vice presidents of five subordinate Yuan, or branches of the government, are selected. The chairman of the State Council is designated head of the government for purposes of representation, with the duties of Commander-in-Chief of the army and navy. The five Yuan (branches) of the government are the Executive, Legislative, Judicial, Examination, and Control Yuan. The Executive Yuan is assisted in the executive work of the government by 10 ministries and 4 boards. The Legislative Yuan, which is the highest legislative organ, consists of between 49 and 99 members appointed by the National government at the instance of the President of the Yuan. The system is to function only during the period of "political tutelage" of the Chinese people, which is limited to six years.

The Chairman of the State Council at the beginning of 1931 was Gen. Chiang Kai-shek. The Ministers functioning under the Executive Council were: Finance, T. V. Soong; Foreign Affairs, C. T. Wang; War, Ho Ying-Ching; Navy, Admiral Yang Shu-chuang; Industry, I. H. Kung; Education, Kao Lu; Railways, Sun Fo; Interior, Liu Shang Ching; Communications, Wang Peh-chun.

#### HISTORY

Chinese history during 1931, as in the previous eventful years since the Nationalist revolution, was one of kaleidoscopic overturns, the rapid rise and fall of military and civil leaders, the constant grouping and regrouping of war lords intent upon extending the areas under their control by force and intrigue. More significant was the sharpening of the bloody struggle between the middle-class and wealthy elements supporting the Nationalist (Nanking) government and communist-led peasants and workers. Significant also was the wave of hysterical nationalism, which swept the country following Japanese military offensives in Manchuria. It forced the resignation of Gen. Chiang Kai-shek as head of the Nationalist government on December 15 and brought into the reorganized administration a group of Cantonese leaders, who since May, 1931, had maintained a rival provisional government at Canton, controlling most of South China.

The most disastrous floods in 50 years inflicted great loss of life and property while countless bands of bandits and undisciplined soldiery continued to ravage great sections of the country. Nevertheless the modernization of China in spirit and in fact continued at a rapid pace. New factories, railways, roads, and canals were built, air lines were inaugurated, and the desire for new things and for doing old things in a new way became almost a mania. In the coast and river areas in touch with Western ideas, old standards and traditions were being rapidly abandoned, contract marriage was giving way to marriage by mutual consent, and the emancipation of women was evidenced by their activities in a hundred new fields. Many of them, convicted of communistic activities, paid with their lives.

**POLITICAL DEVELOPMENTS.** The termination of the great civil war of 1930 had left Gen. Chiang Kai-shek and the young Manchurian war lord, Marshal Chang Hsueh-ling, as the two outstanding military powers in China. Marshal Chang had seized the opportunity presented by the civil struggle, in which he had remained ostensibly neutral, to extend his territory southward to the Yellow River. Establishing his headquarters at Peiping, he controlled a territory almost equal in extent and riches to that under the sway of the Nanking leader. He had at his disposal a large and well-equipped force and the great arsenal at Mukden, from which he had sold munitions to both the Nationalist government and its opponents of the so-called Northern Coalition during the 1930 struggle.

Chang's occupation of the Provinces of Hopei (Chihli), Shansi, and part of Shantung had aided Chiang Kai-shek to defeat the Northern Coalition leaders, Yen Hsi-shan and Feng Yu-hsiang. Moreover, there was a certain community of ideas between the two generals; both were affiliated with the moderately conservative elements of the Kuomintang (Nationalist party). Accordingly the Nanking government acquiesced with fairly good grace in Chang's appropriation of the total revenues of the occupied Provinces. Making a virtue of necessity, Nanking appointed Chang vice commander of the Nationalist armies and charged him with the pacification of the areas north of the Yellow River, in which some 500,000 soldiers from the defeated armies of the Northern Coalition were living off the country.

The alliance between Chiang Kai-shek and Marshal Chang lessened the possibility of war between them or of a new outbreak by Yen Hsi-shan and Feng Yu-hsiang and the Nanking government turned its attention to the three major problems before it—constitutional reform, financial and economic readjustment, and the abolition of extraterritoriality. Early in 1931 a mandate was issued for the election of delegates to a People's Convention to be held in Nanking. A programme worked out by the Nanking leaders for submission to the Convention dealt with all three of these problems. A draft constitution, providing for a provisional legislature, was drawn up. A National Economic Council was organized to carry out a ten-year plan for financial and economic reorganization, which it was hoped would eliminate the conditions responsible for the rapid spread of communism among the peasants and workers. The plan was formulated in cooperation with Sir Arthur Salter, Robert Haas, and Ludwik Rajchman, experts of the League of Nations. Early in May the Nanking government announced the unilateral abrogation of foreign extraterritorial privileges, effective Jan. 1, 1932.

In advance of the People's Convention, however, serious opposition to the government's programme appeared within the Kuomintang and among the members of the government committees. Hu Han-min, member of the Central Executive Committee and chairman of the Legislative Yuan, resigned on March 2, asserting that the proposed "provisional legislature" would be completely under the control of Chiang Kai-shek. His charges expressed a widespread fear that constitutional revision would result in a personal dictatorship by General Chiang, supported principally by Finance Minister T. V. Soong, brother-in-law of the military leader. The Left wing, or Reorganizationists, demanded a reorganization

of the Kuomintang on a broader basis, while in Canton, particularly, there was strong opposition to the predominant influence of the so-called "Soong dynasty" in the government and to the financial policies of T. V. Soong, which the Cantonese felt favored the financial interests of Shanghai and Chekiang capitalists as against their own. The arrest and detention of Hu Han-min caused a stir throughout the country and was soon followed by a successful *coup d'état* of Gen. Chen Chi-tang against the Nanking military representative in the Province of Kwangtung, of which Canton is the capital.

Chen Chi-tang had the support not only of Wang Ching-wei, leader of the Kuomintang Left wing, but also of the Cantonese financial interests. Diverse elements opposed to Nanking in Kwangsi and other southern Provinces joined with Kwangtung in proclaiming a "provisional revolutionary government of south China" on May 28. The strong sectional loyalty of the Cantonese was emphasized by the resignations of Sun Fo, Minister of Railways, and Wang Chung-hui, head of the Judicial Yuan, from the Nanking government and the desertion to Canton of several Cantonese generals controlling some 30,000 of Gen. Chiang Kai-shek's best troops. On May 30 Sun Fo was replaced as Minister of Railways by Lien Shen-hai. C. C. Wu, another Cantonese, resigned as Minister to Washington on June 10.

The People's Convention was thus held (May 5-17) under the threat of the renewal of civil war, which would make the proposed financial and economic adjustments impossible of application. Nevertheless, the Convention adhered strictly to the programme mapped out by the Nanking leaders. A manifesto issued May 13 declared that "the Chinese people will not recognize longer the unequal treaties imposed by the powers upon China." A plan of agricultural rehabilitation was adopted, providing for government aid in placing settlers on new land in the northwest and northeast, improvement of the irrigation system, the establishment of agricultural banks to lend money to farmers at low interest rates, the improvement of farming methods, establishment of coöperatives, and the expansion of primary education. On May 12, the Convention approved the provisional Constitution, designed to serve until the termination in 1934 of the period of "political tutelage," when the trusteeship of the Kuomintang was to give place to responsible government. As foreseen by Chiang's enemies, the new Constitution greatly extended his authority as chairman of the State Council. He was empowered to select and recommend to the State Council for appointment the chairmen of the five governing Yuans, and the chairmen of all governmental commissions. This power had formerly been lodged in the State Council as a body. The new document, which became effective June 1, also embodied a bill of rights.

The grave fears of a large-scale renewal of civil war was emphasized by the action of the Nanking régime in establishing on May 14 a close censorship of cable and radio messages sent from within its sphere of control. Open warfare between the rival Nanking and Canton governments failed to develop, however. Gen. Chiang Kai-shek sent representatives to Canton to discuss a basis of settlement under which the Cantonese and allied groups would peacefully return to the fold

of the Nationalist government and the summer wore away in protracted negotiations. Early in September the Canton régime finally opened its long-expected drive northward against Nanking. On September 7, Canton troops occupied Chenchow, 20 miles north of the Kwangtung-Hunan border. Then the beginning of the crisis with Japan over Manchuria opened the way for conciliation and for a renewal of negotiations. On September 18 it was reported that the Southern forces had withdrawn after some indecisive fighting with Nanking troops.

Meanwhile, the prospect of immediate war on Nanking's southern front was sufficient inducement to a group of minor war lords in the northwest to open an offensive against Gen. Chiang Kai-shek and his Manchurian ally, Marshal Chang Hsueh-liang, in the middle of July. The rebellion was led by Generals Shih Yu-san, Sun Tien-ying, and Feng Yu-hsiang, who with combined forces of over 100,000 troops occupied Honan Province north of the Yellow River, and portions of southern Hopei (Chihli) and Shansi. Instead of driving southward along the Peiping-Hankow railway, as expected, the rebels struck northeastward toward Tientsin. They hoped to turn Marshal Chang's right flank and drive his Manchurian troops back into their native Provinces. The Northern generals met with considerable success at the start, inflicting several defeats on the Manchurians and approaching perilously near Peiping and Tientsin. Aid came in the nick of time from General Shang Chen, war lord of Shansi Province, who having received his price from Nanking in the form of a promised bond issue to "rehabilitate Shansi provincial currency," attacked Shih Yu-san and his allies from the rear. By August 3, the revolt had collapsed, after 250,000 troops had been massed to suppress it.

THE ANTI-COMMUNIST OFFENSIVE. The revolt of the Northern generals occurred while Gen. Chiang Kai-shek was at Nanchang, capital of Kiangsi Province, directing operations against bandits and Communist-led irregular forces. The Communist movement, which gained its chief strength in the more inaccessible and isolated interior Provinces, was fundamentally a social revolution designed to relieve the peasantry from the exactions of landlords and government officials. The National government's first drive to suppress it, opening toward the end of 1930, made little headway. In some cases, the Nanking forces met with severe reverses and early in 1931, 10,000 Nanking soldiers deserted to the Communists. The government was forced to content itself with garrisoning the large cities, establishing cordons of troops around Communist-controlled districts, and preventing the spread of the movement to new areas. Both banks of the Yangtze for 200 miles were reported under Communist control, shipping was continually fired upon, the irregular bands roamed at will over large sections of the countryside. Virtual chaos reigned in the Yangtze valley. Thousands of inhabitants were slaughtered and the survivors reduced to beggary. On June 15, officials of the Nationalist government were reported to have admitted that 20,000 Nanking soldiers had been lost in operations against Communists and bandits in Kiangsi, Hunan, and Northern Fukien Provinces.

On June 21, Gen. Chiang Kai-shek left Nanking for Nanchang to take charge of large-scale

operations against the advancing "Reds" in Kiangsi Province. He had at his command a force reported at 500,000 men, as against the estimated Communist forces of 300,000. His offensive met with greater success than that of Nanking forces during the spring, when four government divisions were defeated by "Red" forces. The concentration of troops in Kiangsi, however, left other areas unprotected against bandit ravages. In a statement issued July 15, Finance Minister Soong declared that the country was embarking upon a life-and-death struggle against the Communist system imported from Soviet Russia. Documents Soong made public revealed that much of Kiangsi and parts of Hunan and Hupeh Provinces had been officially subdivided into sovietized areas. It was generally recognized that attempts to check Communism by armed force was only a temporary expedient and that a more fundamental attack upon the problem would have to be made through alleviating the condition of the hard-pressed peasantry.

**REORGANIZATION AT NANKING.** The general reorganization of the Nanking government which occurred toward the end of 1931 was primarily attributable to the agitation of students and the collapse of Chang Hsueh-liang's power in North China. The crisis in Manchuria (discussed in the article *JAPAN under History*) inflamed Chinese students to a degree of hysterical nationalism hard to conceive of even among Western peoples. Following the Japanese occupation of Mukden and other Manchurian cities on September 18, the Nanking government approved of the policy of passive resistance followed by Marshal Chang Hsueh-liang and the efforts of the Nanking Foreign Office were directed toward securing the assistance of the League of Nations in forcing Japan's withdrawal. The failure of these efforts centred student wrath upon C. T. Wang, the Nanking Foreign Minister. On September 28 Mr. Wang was attacked in his office by a group of student demonstrators and seriously injured. Two days later he was forced to resign, his post being filled temporarily by Frank W. Lee, former Chinese Minister to Mexico.

The student temper had already manifested itself in the declaration of a nation-wide boycott against Japanese products, which within a short time reduced Japan's trade with China by 60 per cent and forced the closing of Japanese factories and shops in China. Fanned by student agitators, a demand for the declaration of war on Japan spread throughout the country. While Chiang Kai-shek and other responsible leaders must have realized that China would be at the mercy of the Japanese fleet and army in case of war, they dared not oppose student sentiment. Chiang, in fact, encouraged the agitation, assuring student delegations that immediate military training would be given all those enlisting in a volunteer corps. He announced before a Kuomintang conference in November that he would lead 2,000,000 troops against the Japanese in Manchuria. His failure to fulfill this promise aroused much sentiment against him, the mounting hostility of the students serving effectively to reinforce the demand of Canton leaders for his resignation.

Early in October it was reported that Chiang Kai-shek had written to Wang Ching-wei offering to resign and asking the Cantonese leaders to meet with his representatives at Shanghai

for a peace conference. The Cantonese went, only to have Chiang change his mind, and the Shanghai peace parley ended in failure on November 2. The unexpected delay in the reorganization of the Nanking government led to the appointment as Acting Foreign Minister on November 23 of Dr. Wellington Koo, an internationally known diplomat and former Premier at Peking. The tide of student indignation at the Nanking government's pacific policy soon reached such heights that Dr. Koo and Dr. Alfred Sze, Chinese delegate to the League of Nations, both offered their resignations on December 5. The resignations were not accepted by the Nanking government. On the following day student demonstrations in favor of stronger methods in Manchuria began to take on alarming proportions. Thousands who had gathered at Nanking from all parts of the country commenced rioting, which the police proved unable or unwilling to stop. The rioting youths were joined by incoming contingents, who forced the railways to give them free transportation from Shanghai, Peiping, and other points. In Shanghai, students took complete charge of the Chinese section of the city, forced the resignation of the Mayor and chief of police, and established their own courts in which they tried police officials charged with obstructing their demonstrations.

On December 11, the Nanking State Council flatly rejected the demands of the 50,000 students then concentrated in the capital. But more continued to arrive, and their constant attacks upon government officials and the wrecking of government buildings and offices made it virtually impossible to transact the business of the government. By December 15, 80,000 students were in Nanking demanding the resignation of Chiang Kai-shek and his Ministers at the same time that Cantonese leaders were putting forward the same demand as the essential condition of their cooperation in forming a new Nationalist government at Nanking. (The Canton-Nanking negotiations had been resumed at Shanghai December 10.) Chiang Kai-shek capitulated to this joint demand (December 15). In a circular telegram he stated that his resignation was necessary to secure national unity which in turn was needed to enable China to resist foreign aggression. Pending the reorganization of the government, Lin Sen, chairman of the Nanking Legislative Yuan, was named acting Chairman of the State Council, and Gen. Chen Ming-shu became Chairman of the Executive Yuan. It was the first time in the history of modern China that such an important governmental overturn had been accomplished without bloodshed or prolonged civil war.

When the Cantonese leaders arrived in Nanking December 17 to prepare for the reorganization of the government at a meeting of the Central Executive Committee of the Kuomintang party, they found themselves confronted with the same student situation which had made official life impossible for the Nanking leaders. The same day troopers fired on a student mob, after they had wrecked the building of the *Central Daily News*, official organ of the Kuomintang. On December 22, Chiang Kai-shek left Nanking for his home city of Fenghua, near Ningpo, refusing the offer of the post of chairman of the National Defense Council. His departure was followed by the final resignations of Dr. Koo as Foreign Minister and of all other

Ministers and Vice-Ministers in the government, including T. V. Soong, the Nanking Minister of Finance, to whom the Cantonese were particularly antagonistic.

Chiang Kai-shek was by no means eliminated from the picture, however. He still retained his military power through a series of alliances with generals loyal to him in Chekiang, Honan, Kiangsi, and Anhwei Provinces. Furthermore, he was reported to have retained the support of more than half of the members of the Central Executive Committee of the Kuomintang. But his overthrow had put an end for the time being to hope of a strong central government capable of achieving peace and undertaking the financial and economic rehabilitation of China. Intrigue, chaos, and the exaggerated student nationalism held sway everywhere except in the foreign settlement of Shanghai. And China remained in much the same condition as when Chiang marched his victorious Nationalist armies northward to the Yangtze in 1926.

**COALITION GOVERNMENT FORMED.** After two weeks of negotiation, during which Gen. Chiang Kai-shek was asked, and refused, to return to Nanking to participate, the formation of a new government was announced following a plenary session of the Kuomintang on December 28. It represented a coalition of factions within the Kuomintang, with the Cantonese controlling the majority of posts. Lin Sen, a veteran statesman and ideologist, succeeded Chiang Kai-shek as chairman of the State Council. Effective authority, however, was centred in the hands of Sun Fo, only son of Sun Yat-sen and a progressive bourgeois from South China, who became head of the Executive Yuan, a post equivalent to the office of Prime Minister. Other officers named were: President of Legislative Yuan, Yuen Chang-chi; President of Examination Yuan, Tai Chi-tao; President of Control Yuan, Yu Yu-jen; President of Judicial Yuan, Wang Chung-hui. The list was notable for the omission of such prominent leaders as Chiang Kai-shek, Hu Han-min, the Left wing leader Wang Ching-wei, and Dr. C. C. Wu. However, General Chiang, Hu Han-min, and Wang Ching-wei were named members of the standing committee of the Central Executive Committee, which functions as the executive power when the full committee is not in session. Other members of the standing committee were Sun Fo, Yu Yu-jen, Ku Meng-yu, Chu Cheng, Chen Kuo-fu, and Yeh Chu-tsang.

The list of ten Cabinet members, announced the following day, was headed by Eugene Chen as Foreign Minister. A leading journalist, Chen negotiated the return to China of the British concession at Hankow during a previous term as Foreign Minister. The other members were: Finance, Huang Han-liang; Communications, Chen Ming-hsu; Railways, Yeh Kung-cho; War, Gen. Ho Ying-chin; Navy, Adm. Chen Hsueh-kuan; Education, Chu Chia-hua; Justice, Dr. Lo Wen-kan; Home Affairs, Li Wen-fan; Industry, Chen Kung-po. Of the ten Cabinet posts, the Nanking faction secured only the portfolios of War, Marine, and Education, the remainder going to the Cantonese. In general, the Cabinet was distinctly more radical in character than its predecessor.

During the course of the negotiations, Mme. Sun Yat-sen, influential widow of the founder of the Kuomintang movement, made a slashing attack upon both the Nanking and Canton fac-

tions. Declaring that both were composed of "self-interested, foreign-controlled politicians, who are in no way concerned with bettering China's position either at home or abroad," she predicted that the coalition would break up in civil war in the spring and that disorder would reign in China until a real revolutionary government had been established by the workers and peasants.

**THE SITUATION IN NORTH CHINA.** Japanese military activities in Manchuria thus weakened the internal position of the Nanking government and led directly to the overthrow of Chiang Kai-shek. Furthermore, in stripping Marshal Chang Hsueh-liang of his power, the Japanese completely upset the military and political equilibrium in North China. While the war lords and political leaders of all China made an effort toward unity in the face of what they considered to be foreign aggression, it was considered certain that far-reaching readjustments and shiftings of power would take place in North China during 1932.

When the Japanese undertook military action in Manchuria on the morning of September 19, Chang Hsueh-liang had an army of 340,000 men, including 220,000 in Manchuria and 120,000 in China proper north of the Yellow River. Besides the largest armory in the world at Mukden, he had immense military stores and some 200 airplanes. Before a month had elapsed Chang's sources of power in Manchuria had been completely cut off. The Mukden arsenal, military stores, airplanes, food reserves, and revenues had been confiscated or diverted to other channels. Of Chang's troops in Manchuria, 70,000 had been forcibly disarmed and the remaining 150,000 were scattered and unpaid, living off the inhabitants or divided among minor militarists intent upon establishing separate domains for independent exploitation. The young Marshal retained control of the 120,000 Manchurian troops in the Peiping-Tientsin area, but since the revenues from this district were insufficient to support them he was obliged to look to Nanking for further revenue, and Nanking had little to send him.

With Chang's ability to crush new anti-Nanking coalitions in the North seriously impaired, Gen. Chiang Kai-shek was forced to abandon his plans for forcible resistance to the Cantonese. Hence the renewal of the Nanking-Canton negotiations in November, which finally resulted in the resignation of Chiang. Previous to his resignation, Chiang's uncompromising hostility to Feng Yu-hsiang and Marshal Yen Hsi-shan also underwent a complete change. These two worthies, defeated and harried into seclusion in 1930, had returned to their old districts in Shansi and other northwestern Provinces and were rebuilding their shattered forces. The change in Chang Hsueh-liang's fortunes caused the Nanking leader to restore both Feng and Yen to their former membership in the Kuomintang executive committee and to invite them to visit Nanking. For other developments in Manchuria, see JAPAN under *History*.

**THE GREAT FLOODS.** The valleys of the Yangtze, Hwai, and Yellow Rivers were visited during 1931 by the most disastrous floods recorded for over half a century. Commencing toward the end of July, the floods continued well into November. A thickly populated area of some 34,000 square miles was affected, with an additional

8000 square miles partially flooded. It was estimated that approximately 1,000,000 persons lost their lives, including the thousands who succumbed to starvation and disease directly attributable to flood conditions. Nanking officials placed the number rendered homeless and destitute at 80,000,000; many of these were expected to succumb during the winter, although the Nanking government appropriated about \$18,000,000 (U. S. currency) for relief. The damage to property and crops was enormous. In the Hankow area alone, where the city and surrounding districts were under water for several months, the damage was placed at \$250,000,000. In September the Nanking government purchased about 15,000,000 bushels of wheat from the U. S. Federal Farm Board for famine relief purposes on liberal credit terms.

**FOREIGN RELATIONS.** The Japanese-Chinese clash in Manchuria pushed into the background the relations of China with other foreign powers. The principal development in this field was the announcement of the Nanking government on May 4, 1931, that all existing extraterritorial rights of foreigners in China would be abrogated effective Jan. 1, 1932. This action, taken without the consent of the principal treaty powers, violated the terms of unexpired treaties with the United States, Great Britain, and several other countries. It aroused little foreign reaction, however, as negotiations already under way with the foreign treaty nations appeared to be approaching a successful conclusion. The Nanking pronouncement was generally considered an effort to mollify Chinese nationalist sentiment.

Shortly afterward Foreign Secretary Henderson informed the British House of Commons that negotiations with China on the extraterritoriality question had broken down upon British insistence upon temporary exclusion of the treaty ports (Tientsin, Shanghai, Hankow, and Canton) from an immediate agreement. The disappearance of John Thorburn, a British citizen arrested by Chinese military police on June 3 and alleged to have been secretly done to death, caused a further setback in British-Chinese negotiations. The Belgian concession at Tientsin was formally returned to Chinese authorities in January, 1931, and on July 31 the judicial board of the Nanking government took over the mixed court in the French concession of Shanghai in accordance with a Franco-Chinese treaty. This secured Chinese control over cases in which Chinese were defendants, a provision already in effect in the International Settlement.

The Chinese tariff, which went into effect Jan. 1, 1931, was the first in which Chinese authorities exercised practically complete autonomy in fixing rates since the Western powers entered into treaty relations with China. The new rates imposed were designed to foster and protect domestic industries.

The third meeting of the Sino-Soviet conference to arrange for the formal application of the Khabarovsk protocol of December, 1929, opened in Moscow, Apr. 11, 1931, but was again adjourned without definite progress. In the meantime, however, the Soviet government had regained by force its treaty right to a half interest in the operation of the Chinese Eastern Railway (see 1929 YEAR BOOK) and it continued to exercise joint control with representatives of Chang Hsüeh-liang throughout 1931. While China was absorbed in factional disputes and in its

passive struggle with Japan, the Soviet Union was tightening its grip upon Outer Mongolia (see MONGOLIA). According to an *Associated Press* dispatch of June 13, 1931, from Harbin, Soviet officials formed the backbone of the Outer Mongolian administration, the country was governed along Soviet lines, and its entire trade had been transferred from Chinese to Russian hands. The Nanking government was without official representation in Urga, the capital of Outer Mongolia, the resident Soviet envoy being the dominant figure. All this was despite the fact that the Sino-Soviet treaty of 1924 recognized Outer Mongolia as "an integral part of the Republic of China."

Chinese officials expressed the fear that Soviet economic penetration in Sinkiang (Chinese Turk-estan) and Inner Mongolia would result in eventual political control. The newly completed Tur-sib railway, paralleling the Sinkiang border, offered a convenient base for the extension of Soviet influence. In Northern Manchuria, also, Soviet influence was expanding and the Japanese advance toward the Chinese Eastern Railway called forth a sharp protest from Moscow (see UNION OF SOVIET SOCIALIST REPUBLICS under *History*). On April 6, an investigator for the Nanking government reported that Soviet troops and Russian families had occupied a border strip of Manchurian territory about 400 miles long and ten miles wide in Heilungkiang and Kirin Provinces.

Relations with the United States government remained cordial. The forcible expulsion of numerous Chinese from northern and western Mexico during 1931 caused strained relations between the Mexican and Chinese governments. The U. S. government granted Chinese expelled from Mexico the right to return to China through American territory, but it refused a request of the Chinese Foreign Minister to mediate the dispute when the Mexican government intimated that such mediation would not be welcome (see MEXICO under *History*). Three American missionaries were murdered by Chinese bandits during 1931 and a number of others were captured and held for ransom. The murders occurred in interior districts only nominally under the Nanking government's control and which foreigners had been repeatedly warned to evacuate.

**THE FUTURE OF SHANGHAI.** With the approaching abolition of extraterritoriality and the gradual relinquishment by foreign powers of their concessions in China, the future of the International Settlement in Shanghai became a problem of first importance. Realizing the necessity of formulating "a constructive scheme which while giving full consideration to the aspirations of the Chinese people will, at the same time, afford reasonably adequate protection during this transition period to the great foreign commercial and business interests which have been developed in Shanghai," the Municipal Council of the Foreign Settlement on Dec. 6, 1929, called in Justice Richard Feetham of the Supreme Court of South Africa to study the situation and advise the Council. Shanghai had become China's major port. In 1930, 51 per cent of all imports into China and 35 per cent of all exports passed through its harbor. The Foreign Settlement, occupying 8.66 square miles fronting the Whangpoo River, had a population of 26,965 foreigners and 971,397 Chinese, as compared with 12,335 foreigners and 421,885 Chinese in the French Conces-

sion, and with 9790 foreigners and 1,679,310 Chinese in the section of Shanghai under Chinese administration. The foreign business houses built up in the International Settlement over a long period of years, represented large capital investments and handled a major share of the trade of the port.

The report of Justice Feetham, made public in several sections in June, 1931, and thereafter, suggested a plan based upon the continuance of extraterritoriality in the Settlement. Abolition of extraterritoriality, he said, should be deferred until China was united and pacified under a central, constitutional government capable of maintaining order and justice. He urged greater Chinese participation in the government of the Settlement, but maintained that the majority of the Council must remain foreign and that foreign powers should continue their protection under the provisions of a new treaty. The recommendations were not approved by the Chinese press and were contrary to the announced policy of the Nanking government. See MILITARY PROGRESS.

Blakelee, "The Foreign Stake in China," both in *Foreign Affairs* for October, 1931; "Communism in China," *Foreign Affairs*, January, 1931; Harley F. MacNair, *China in Revolution* (Chicago University Press, 1931); Nathan Pepper, *China: The Collapse of a Civilization* (New York, 1931); Thomas F. Millard, *The End of Extraterritoriality in China* (Shanghai, 1931); J. O. P. Bland, "South China's Secession Move," *Current History*, November, 1931.

**CHINA CONFERENCE.** See PACIFIC RELATIONS.

**CHORAL MUSIC.** See MUSIC.

**CHOSEN.** See KOREA.

**CHRISTIAN CHURCH.** See CONGREGATIONAL AND CHRISTIAN CHURCHES; and articles on various religious denominations.

**CHRISTIAN ENDEAVOR, INTERNATIONAL SOCIETY OF.** An organization comprised of all Christian Endeavor societies in the United States and Canada, found among the evangelical and reformed denominations, and a member of the World's Christian Endeavor Union, comprised of Christian Endeavor societies in 87 countries. The first society was organized in Portland, Me., Feb. 2, 1881, by the Rev. Francis E. Clark, a Congregational minister, for the purpose of training young people in the duties of church membership and the activities of the Christian life.

The international society consists of active organizations for each State and each Canadian Province. These, in turn, in 1931 were divided into 1200 city, county, and district unions, each including from 3 or 4 to 500 societies, with a membership in the United States and Canada of 2,500,000. Throughout the world there were in the same year approximately 80,000 societies, with a membership of 4,000,000, organized in 126 nations, dominions, States, and island groups.

The international society is organized into the following departments to carry on its work: Christian vocations, which yearly gives vocational counsel to thousands of young people in high schools and colleges; travel and recreation, which supplies, free of charge, monthly church-centred recreation service to Christian Endeavor

societies and church workers and conducts world-friendship tours to Europe for young people at cost; citizenship, which interests young people in citizenship problems, aids first voters, and works for moral reform; army and navy, which promotes societies in army posts and navy yards and conducts meetings on thousands of merchant vessels (in some cities sailors' homes are conducted by Endeavorers); social service and prison work, which conducts classes for foreigners, helps in community enterprises, and conducts meetings and organizes societies in prisons. The society also promotes systematic and proportionate giving through the Tenth Legion, in which 77,532 have been enrolled; emphasizes regular habits of prayer and daily Bible reading through the Quiet Hour, in which 267,224 have been enrolled; and recruits for the Christian ministry and missionary work through the Life Work Recruits, in which 10,190 have been enrolled.

The international society celebrated its fiftieth anniversary at its convention in San Francisco July 11-18, 1931, with 4000 delegates in attendance. Problems of Christian citizenship, law observance, world peace, and church unity were discussed, and a two-year plan of evangelism was launched in accordance with the youth crusade-with-Christ theme of the world's convention in 1930. The official periodical of the international society is the *Christian Endeavor World*. The officers for 1931 were: President, the Rev. Daniel A. Poling; vice presidents, the Rev. William Hiram Foulkes and the Rev. Howard B. Grosse; treasurer, A. J. Shartle; and general secretary, Carlton M. Sherwood. Headquarters are at 41 Mount Vernon Street, Boston, Mass.

**CHRISTIAN SCIENCE.** A system of metaphysical or spiritual healing discovered by Mrs. Mary Baker Eddy in 1866. The first church was established by Mrs. Eddy in Boston in 1879 and given a charter by the Commonwealth of Massachusetts. In 1892 it was reorganized as a voluntary religious association known as The First Church of Christ, Scientist, in Boston, called more frequently by its adherents "The Mother Church." Mrs. Eddy wrote the textbook of the movement, *Science and Health with Key to the Scriptures*, published in 1875. The Sunday services of the church are conducted by first and second readers, the former reading from *Science and Health*, and the latter from the authorized version of the Bible. In 1931 more than 10,000 practitioners of Christian Science in the United States and other countries were devoting their entire time to healing the sick through prayer.

A board of directors administers the affairs of The Mother Church. Its annual meeting was held in Boston June 8. Reports indicated expenditures totaling \$1,873,457 from the general fund of the church during the year. During the fiscal year ending May 31, 1931, 79 churches and Christian Science societies, including several university societies, were recognized as branches of The Mother Church: 45 in North America, 26 in Europe, 1 in Asia, 4 in Australasia, and 2 in South America. The total number of recognized branches was 2519. Three departments conduct the principal activities of the movement: The Board of Education, Board of Lectureship, and Committee on Publication. The Board of Education instructs and authorizes students to teach Christian Science: the Board of Lecture-

ship consists of 26 members who deliver free lectures on Christian Science throughout the world. During the year 3732 lectures were delivered, of which 3294 were in the United States, Canada and Alaska, and 438 in foreign fields.

The Committee on Publication aims to correct impositions on the public in regard to Christian Science. It also endeavors to guard the rights of Christian Scientists against restriction by public authority. The Christian Science Publishing Society, which publishes and issues the authorized literature of The Mother Church, operates under a deed of trust granted by Mrs. Eddy; its affairs are now administered by a board of trustees according to the Manual of the church. The publishing society issues the daily paper of the organization, *The Christian Science Monitor*; other periodicals include: *The Christian Science Journal*, *Christian Science Sentinel*, and the four editions of *The Herald of Christian Science* in the German, French, Dutch, and Scandinavian (Danish, Swedish, and Norwegian) languages respectively, each with the English translation opposite. The Benevolent Association of the Church conducts sanatoria in Brookline, Mass., and San Francisco, Calif. Pleasant View Home in Concord, N. H., is a home for Christian Scientists of advanced years. Duncan Sinclair was president of The Mother Church for the year ending May 31, 1931. The headquarters of the church are at 107 Falmouth Street, Boston, Mass.

**CHRISTMAS ISLAND.** The name applied to two separate islands, one in the Indian Ocean forming a part of the Straits Settlements (q.v.) and the other the largest atoll in the Pacific Ocean, belonging to the Gilbert and Ellice Islands Colony (British).

King Alexander of Yugoslavia announced a return to parliamentary government.

The Chilean cabinet resigned as a Communist-led revolt broke out in the navy.

3—The Berlin stock exchange reopened for the first time since July 11; stock prices declined by 25 to 40 per cent.

The Austrian and German Governments formally renounced their Customs Union project when the European Union Commission reconvened in Geneva.

A Syndicalist strike in Barcelona, Spain, plunged the city into two days of fighting and terror.

4—President Hoover announced the sale of 15,000,000 bushels of the Farm Board's wheat surplus to the Chinese Government for the use of flood refugees.

5—The World Court ruled eight to seven that the proposed Austro-German Customs Union project violated the conditions under which the League of Nations made a loan to Austria in 1922.

6—Convening in special session the British Parliament approved Mr. MacDonald's new National Government by a vote of 309 to 250.

7—The Chilean naval mutiny was suppressed by air and army units loyal to the government.

8—Sir Hubert Wilkins' submarine, *Nautilus*, returned to Svalbard (Spitsbergen) after a cruise under the Arctic ice.

The German Government announced the purchase of 7,200,000 bushels of the U. S. Farm Board's wheat surplus.

Foreign Minister Dino Grandi of Italy, addressing the League Assembly, proposed an armament construction truce to last at least until the 1932 Disarmament Conference was over. The proposal was accepted in modified form.

Chairman James C. Stone of the U. S. Federal Farm Board announced that the Board had abandoned its effort to stabilize prices by large-scale buying.

10—A hurricane and tidal wave wrecked Belize, capital of British Honduras, killing over 800 persons.

12—Mexico entered the League of Nations but with a reservation covering Article XXI of the Covenant, which recognized "regional understandings like the Monroe Doctrine."

Mahatma Gandhi arrived in London to attend the second Round-Table Conference on India.

13—A new airplane speed record of 379 m.p.h. was established near Calshot, England, by Flight Lieut. G. H. Stainforth. On September 29 he exceeded his own record, with a speed of 406.997 m.p.h.

An abortive Heimwehr uprising occurred in the Province of Styria, Austria.

15—A near mutiny among sailors of the British Atlantic battle fleet, due to pay cuts, caused postponement of the autumn maneuvers.

17—The American Bar Association went on record as overwhelmingly opposed to prohibition.

19—Japanese military forces in Manchuria inaugurated their armed intervention outside of the treaty areas, following the alleged bombing of a section of the Japanese-owned South Manchuria Railroad by Chinese troops.

20—Great Britain's National Government abandoned the gold standard, as a result of continued depletion of the Bank of England's gold reserve.

21—President Hoover told American Legion in convention at Detroit that the proposed \$2,000,000,000 cash bonus settlement would endanger national stability. The bonus proposal was rejected by the Legion September 24, by a vote of 902 to 507.

China formally invoked Article XI of the League Covenant in her dispute with Japan over Manchuria.

22—The United States Steel Corporation announced a 10 per cent cut in wages of 220,000 employees, effective October 1. Other great industrial concerns followed suit.

24—By a vote of 1008 to 894 the American Legion convention favored a national referendum on repeal or modification of the prohibition laws of the United States.

The Philippine Legislature unanimously adopted a resolution reiterating its demand for immediate independence for the islands.

Gen. Petar Zhivkovitch resigned as Premier of Yugoslavia.

25—Italy increased her tariffs 15 per cent to eliminate a threatened \$27,000,000 budget deficit.

Bolivian and Paraguayan patrols clashed at Agua Rica in the disputed Gran Chaco region.

27—Norway, Sweden, and Egypt abandoned the gold standard as a result of the similar action by Great Britain. Denmark followed suit the next day.

Premier Laval and Foreign Minister Briand of France arrived in Berlin for a conference with German officials.

Foreign Minister C. T. Wang of China was seriously injured by a student mob for his failure to secure the intervention of the League of Nations in the Sino-Japanese clash in Manchuria. Mr. Wang resigned September 30.

28—A joint commission to promote Franco-German economic collaboration was agreed to by Premier Laval and Foreign Minister Briand at Berlin.

29—The Protestant Episcopal Church of the United States at its Denver convention modified the canon restricting the remarriage of divorced persons.

October 1—The United States Government transferred public works, agricultural and industrial education, and public health services in Haiti to native control.

Rioting by the unemployed reached serious proportions in Scotland and Lancashire.

The Spanish Constituent Cortes extended suffrage to women of 23 years and over.

2—A renewed drain of gold and foreign exchange from the Reichsbank aroused fear of a repetition of the summer's crisis.

3—A plan for consolidation of the Pennsylvania, New York Central, Baltimore & Ohio, and Chesapeake & Ohio railways was submitted to the Interstate Commerce Commission by the presidents of the roads.

Pope Pius XI issued an encyclical urging aid for the unemployed and denouncing the international competition in armaments.

5—The National Cabinet of Great Britain decided to call an immediate general election.

U. S. Senator Dwight W. Morrow died unexpectedly at Englewood, N. J.

Hugh Herndon and Clyde Pangborn landed at Wenatchee, Wash., after making the first non-stop trans-Pacific flight from Japan.

6—A plan for the formation by banking interests of a national credit institution, with resources of \$500,000,000, to help maintain the liquidity of banks was announced by President Hoover.

Foreign Minister Julius Curtius of Germany resigned.

7—Prime Minister MacDonald opened the British electoral campaign with a nationwide radio address.

Chancellor Brüning's Cabinet resigned after issuing a decree extending the German Government's control over economic, financial, and political agencies.

8—Japanese military airplanes bombed the headquarters of Marshal Chang Hsüeh-liang at Chinchow and the Manchurian crisis entered a more serious phase.

President Vargas of Brazil decreed a 60-day moratorium on all commercial and private foreign payments, except foreign exchange contracts.

9—Chancellor Brüning formed a second coalition cabinet in Germany.

The New Jersey Legislature petitioned Congress to modify the Volstead Act to permit manufacture and sale of light wines and beer.

10—Secretary of State Stimson notified the League of Nations Council that the "American Government, acting independently through its diplomatic representatives will endeavor to reinforce what the League does" to avert the Manchurian crisis.

The Uruguayan Congress voted an obligatory moratorium on foreign commercial obligations until Dec. 31, 1931.

11—Randolph Burgess of the Federal Reserve Bank of New York explained the American banking position to representatives of European central banks at Basel, Switzerland. His reassuring statement caused the heavy drain of gold from the United States to slacken.

Lieut. Col. Luis M. Sánchez Cerro was elected President of Peru.

The St. Louis Cardinals became world baseball champions for 1931 by defeating the Philadelphia Athletics in the World Series.

German National Socialists (Hitlerites) and Nationalists united forces against the Brüning Government.

12—The 12 directors of the newly-organized National Credit Corporation were announced in New York.

Finland, Northern Rhodesia, and Southern Rhodesia abandoned the gold standard.

The Malinoff Cabinet in Bulgaria resigned and a

new ministry was constituted under Nicholas Mushanoff.

13—A Constitutional provision for the separation of church and state was passed by the Spanish Cortes, 287 to 41.

The League of Nations Council reconvened in Geneva and resumed its efforts toward a settlement of the Manchurian crisis.

The fourth Pan American Commercial Congress concluded its sessions in Washington.

The German Reichstag reassembled, only to adjourn three days later, after an opposition motion of censure had been defeated, 295 to 270.

14—Manuel Azana, Minister of War, succeeded Niceto Alcalá Zamora as the Provisional President of the Spanish Republic.

15—Alfredo Baquerizo Moreno succeeded Louis Larrea Alba as Provisional President of Ecuador, when an attempt by the latter to establish a dictatorship failed.

The Federal Reserve Bank of New York raised its discount rate from 2½ to 3½ per cent in an effort to end hoarding.

The Mexican Cabinet was reorganized, with former President Plutarco Elias Calles as Minister of War.

16—The Government of the Irish Free State placed in effect a drastic public safety bill, to end a state of terrorism.

Prentiss Gilbert, American consular representative in Geneva, took his seat with the League of Nations Council in a consultative capacity, during consideration of the Sino-Japanese dispute over Manchuria.

18—Thomas Alva Edison, inventor, died at West Orange, N. J., at the age of 84.

19—Yorktown, Va., celebrated the 150th anniversary of the surrender of the British army under Lord Cornwallis. President Hoover spoke.

The Canadian Government restricted the export of gold to shipments licensed by the Minister of Finance.

A national employment insurance plan for the United States was submitted to a committee of Senators by Gerard Swope, president of the General Electric Company.

20—The United States Government called the attention of the Government of Japan and China to their obligations under the Kellogg-Briand Pact to maintain peace in Manchuria.

Rejecting the application of the railways for a 15 per cent increase in freight charges, the U. S. Interstate Commerce Commission offered a substitute plan for specific increases on specified commodities.

Neptali Bonifaz was elected President of Ecuador. The second Balkan Conference convened at Istanbul, Turkey, continuing until October 26.

21—The naval dirigible Akron, world's largest airship, was delivered to the U. S. Navy by the builders.

22—Premier Pierre Laval of France arrived in New York on his way to Washington for a discussion of Franco-American relations with President Hoover.

Anti-British rioting broke out on the island of Cyprus, in connection with an agitation for union of the island with Greece.

23—The Paraguayan Government proclaimed a state of siege, following student disorders in Asunción.

President Hoover's organization for unemployment relief recommended a programme to promote business recovery.

24—The League of Nations Council called on Japan to withdraw its troops in Manchuria within the treaty areas by November 16.

The George Washington Bridge across the Hudson at New York City, longest suspension bridge in the world, was officially opened to traffic.

25—Premier Mussolini of Italy reiterated his demand for revision of the Versailles Treaty and for disarmament on the same day that Foreign Minister Grandi arrived in Berlin for an official visit.

A joint statement was issued by President Hoover and Premier Laval setting forth the results of their conversations. Premier Laval sailed for France, October 27.

Federal Judge James H. Wilkerson sentenced Alphonse Capone, noted gang leader, to 11 years in prison, a \$50,000 fine, and \$100,000 costs for evading income tax payments to the United States Government on his illegal revenues.

26—President José Guggiarri of Paraguay resigned by compulsion and was succeeded by Dr. E. González Navero, the Vice President. A new Liberal Cabinet was formed.

27—Conservatives supporting the British National Government won a sweeping victory in the general election. Prime Minister MacDonald was reelected in a Labor constituency by 6000 majority.

President Hoover issued a statement opposing immediate independence for the Philippine Islands.

The U. S. Government accepted the League of Nations' proposal for the postponement of new armament construction for one year, provided that the other great naval powers of the world took similar action.

30—The Turko-Soviet treaty of 1929 was renewed for five years.

The U. S. Shipping Board sold the U. S. Lines to a holding company organized by the Dollar Line, the Dawson interests of San Francisco, and the Roosevelt-International Mercantile Marine interests of New York.

31—At Premier Mussolini's behest, Italian industry and labor agreed to reduce wages and other production costs.

November 2—President Hoover appointed a committee to investigate charges of William Howard Gardiner, president of the Navy League, that the U. S. Navy was being "starved." The committee reported November 7 that the charges were "wholly unwarranted."

The short term credit extended to the German Reichsbank by the Federal Reserve Bank of New York June 25 was renewed.

3—Local elections were held throughout the United States, resulting in Democratic control of the National House of Representatives.

The Constituent Cortes of Spain wrote into the new Constitution a provision that war could be declared by the President only if it was beyond question defensive, if it was in accord with the law of the League of Nations, and if the dispute had first been submitted to the League for arbitration.

Emperor Haile Selassie I of Ethiopia opened the first national legislature at Addis Ababa.

Proposals for administrative union of Uganda, Kenya, and Tanganyika were rejected in the report of the British Parliamentary committee on closer union in East Africa.

4—Wheat prices on the Chicago market rose to 70 cents a bushel from a record low of 44 cents on October 5.

Former Prime Minister David Lloyd George resigned as leader of the badly divided British Liberal party.

5—Prime Minister MacDonald announced the new British National Cabinet.

A native mission to seek independence for the Philippines sailed from Manila for the United States.

8—Parliamentary elections were held in Yugoslavia. Gen. Agustin Justo was elected President of Argentina.

Prince Nicholas of Rumania eloped with Mme. Dumitrescu (Mme. Jana Delet).

Chinese mobs attacked the Japanese concession in Tientsin.

9—An earth slide in the Panama canal interrupted traffic for two days.

The Filipino Legislature approved Manuel Quezon's plan for 10 years of autonomy with free trade, followed by a plebiscite to determine future relationships with the United States.

10—A second Sino-Japanese clash occurred in Tientsin, during which the American Methodist Mission was damaged.

A line between Klamath Falls, Ore., and Keddies, Calif., connecting the Great Northern and Western Pacific Railways, was completed.

Addressing the first session of the newly elected British Parliament, Prime Minister MacDonald declared a new settlement of war debts and reparations was necessary to right the world's "crazy economy."

11—Bolivia and Paraguay opened negotiations in Washington for a non-aggression pact and the settlement of the Chaco dispute.

The Statute of Westminster received the assent of King George.

13—A Toronto, Canada, court, sentenced eight Communist leaders to prison and authorized confiscation of the party's property in Canada.

Stanley Baldwin, British Conservative leader, told the House of Commons that the private commercial debts of Germany should have priority over reparation payments.

15—In elections to the Hessian Diet, German National Socialists (Hitlerites) more than doubled the vote polled in the September, 1930, elections to the Reichstag.

16—The Council of the League of Nations reconvened in Paris in a new effort to restore peace in Manchuria.

Foreign Minister Dino Grandi of Italy arrived in Washington for conversations on Italo-American relations with President Hoover. He sailed for Italy November 27.

The League of Nations Secretariat informed the powers that an armaments construction truce had been accepted for one year, commencing Nov. 1, 1931.

19—The German Government asked the Bank for International Settlements to appoint a special advisory committee to investigate Germany's capacity to resume reparation payments on July 1, 1932.

The Soviet Union, during the second Five-Year Plan (1933-38), would concentrate upon the production of goods with which to raise the domestic

standard of living, it was semi-officially announced. Only surplus products would be shipped abroad.

Former King Alfonso was declared a traitor and forbidden to set foot on Spanish soil in a law passed by the Cortes.

Japanese troops occupied Taitshih, metropolis of northwestern Manchuria, after defeating Chinese forces at the Nonni River.

The British House of Commons approved the first of a series of protective duties on imported articles, thus abandoning the nation's traditional policy of free trade.

22—The U. S. Federal Farm Board announced that nearly 7,000,000 bales of cotton would be withheld from the market until July 31, 1932, in order to prevent further price declines.

23—Nicaraguan insurgents captured and looted the town of Chichigalpa.

24—Philip Snowden, former Labor Chancellor of the British Exchequer, was elevated to the peerage as Viscount Snowden of Ickneshaw.

The Scullin (Labor) Government of the Commonwealth of Australia was defeated in the Federal House of Representatives and resigned. New elections were called for December 19.

26—Europeans and Americans were endangered at Tientsin, China, during fighting between Chinese and Japanese troops.

Premier Laval stated that France would consent to a reduction of German reparation payments only on condition of an equal reduction in payments on the French war debt.

27—Bert Hinkler, Australian aviator, landed at St. Louis, Senegal, West Africa, after a solo transatlantic flight from Natal, Brazil.

A mass meeting for disarmament held in the Trocadero Palace, Paris, by delegates from peace societies in 80 countries was broken up by the organized obstruction of French Nationalists.

A Round-Table Conference to determine the political future of Burma opened in London.

28—A plot to overthrow the Hungarian Government was nipped in the bud by the arrest of 32 conspirators.

British authorities at Tharawaddy, Burma, hanged Saya San, also known as King Golden Crow, leader of a formidable native revolt.

The U. S. Department of Labor announced that a cotton-picking machine had been developed capable of doing in three hours the equivalent of 77 hours of picking by hand.

30—The Viceroy of India signed an ordinance conferring broad powers on magistrates to deal with a campaign of terrorism which had broken out in Bengal.

December 1—Prime Minister MacDonald of Great Britain, at the close of the second Round-Table Conference on India, reaffirmed his Government's intention to proceed with the creation of a federated Indian state.

The Federal Government of Brazil defaulted on interest and amortization payments on four foreign loans.

The Wabash Railway went into the hands of Federal receivers at St. Louis, Mo.

2—The Coalition Government of New Zealand decisively defeated Labor in a general election.

A conference on home building and home ownership, called by President Hoover, opened at Washington, with 3000 delegates in attendance.

3—The British Government's policy of eventual dominion status for India was upheld, 369 to 43, in the House of Commons.

President Arturo Araujo of Salvador was overthrown by a military revolt. The following day the revolutionary junta appointed Gen. Maximiliano Martinez to the Presidency.

The Canadian National and Canadian Pacific Railways announced wage reductions of 10 per cent, retroactive to November 15.

4—Additional duties of 15 per cent were imposed on imports from Great Britain by the French Government. Juan E. Montero was inaugurated constitutional President of Chile.

Bituminous coal mine operators of Eastern United States formulated a plan for stabilization of the industry.

5—The Cathedral of the Redeemer, Moscow's largest church, was destroyed by dynamite to provide a site for the new Palace of the Soviets.

Foreign Minister Wellington Koo of the Chinese (Nanking) Government resigned.

The District of Columbia Supreme Court sustained President Hoover's refusal to resubmit the appointment of Dr. George Otis Smith as chairman of the Federal Power Commission, after Dr. Smith's appointment had once been confirmed by the Senate.

6—A Moslem Congress, attended by representatives from the chief Moslem countries, opened its sessions in Jerusalem.

7—Secretary of the Treasury Mellon invited sub-

scriptions for \$1,800,000,000 of U. S. Government notes and certificates of indebtedness.

The Seventy-second Congress convened at Washington, with Democrats in control of the House for the first time in 12 years. Representative John N. Garner, of Texas, was elected Speaker.

Led by Communists, a group of about 1600 "hunger marchers" reached Washington by automobile caravans and attempted unsuccessfully to petition Congress and President Hoover for Federal guarantees of employment and for national unemployment insurance.

After being suspended for three years, the Yugoslav parliament was reconvened at Belgrade.

Deputy Giovanni Giuristi resigned as Secretary-General of the Italian Fascist party and was succeeded by Achille Starace.

8—The German Government's control over the nation's economics, finances, and politics was drastically extended by decree.

President Hoover, in his annual message to Congress, submitted a programme of legislation designed to stimulate business recovery.

Col Luis M. Sánchez Cerro was inaugurated as constitutional President of Peru.

About 1500 delegates representing 1,500,000 railway employees in the United States met in Chicago to discuss wage cuts.

9—In his annual Budget message, President Hoover recommended increased taxation to prevent an estimated deficit of \$2,123,000,000 in 1931-32 and of \$1,417,000,000 in 1932-33.

The new Constitution of the Spanish Republic was adopted in final form by the Cortes (parliament), 368 to 0, with 98 abstentions.

10—An attempt by Philippine Communists and fanatical patriots to attack Manila and overthrow the government was frustrated; 154 were subsequently arrested for sedition.

The Council of the League of Nations adopted a second proposal for settlement of the Manchurian crisis.

William B. Jones, mine union secretary active in the Harlan County, Ky., labor difficulties, was convicted at Mt. Sterling, Ky., of the murder of a deputy sheriff during the clash at Evans between strikers and peace officers; he was sentenced to life imprisonment.

President Hoover's annual survey of foreign relations, in which he asked immediate approval of the Administration's moratorium on war debt payments to the United States, was read in Congress.

11—Premier Reijiro Wakatsuki and his Minseito Cabinet resigned in Japan.

President A. Smetona of Lithuania was reelected for a seven-year term by an electoral college.

Niceto Alcalá Zamora, former Provisional President of the Spanish Republic, was inaugurated as constitutional President.

Representatives of Germany's private creditors in 22 countries met German bankers in Berlin. Their task was to formulate a policy with regard to short term private credits "frozen" in Germany until the expiration in February, 1932, of the standstill agreement reached in June, 1931.

12—The Azana Cabinet resigned in Spain, but was reorganized December 15 under the same head.

13—Japan abandoned the gold standard, a minority cabinet was formed under Ki Inukai.

14—President Hoover requested an additional appropriation of \$136,352,000 during the 1931-32 fiscal year for public buildings and roads.

Executives of the railways of Eastern United States accepted a union proposal for the establishment of a joint committee to negotiate on wages and employment on the railways.

15—Chiang Kai-shek and T. V. Soong resigned with the entire Nanking Government and a new government was formed, with Cantonese leaders holding the most prominent positions.

A conference to consider economic collaboration between Argentina, Brazil, and Uruguay, opened at Montevideo, Uruguay.

The Republican National Committee of the United States scheduled the party's 1932 presidential convention for June 14 at Chicago.

Nicholas Murray Butler, president of Columbia University, New York, and Jane Addams, founder of Hull House, Chicago, were awarded the Nobel Peace Prize.

16—A Republican anti-prohibition bloc of 64 members was organized in the U. S. House of Representatives.

The Metropolitan Opera, New York City, broadcast *Haensel und Gretel* to a world-wide audience.

18—The U. S. House of Representatives passed, 317 to 100, a joint resolution approving the Hoover moratorium proposal of June 20.

19—An agreement for restriction of world copper production during 1932 was reached by the leading producers at Brussels, Belgium.

The U. S. House of Representatives passed a bill adding \$100,000,000 to capitalization of Federal land banks.

Premier Scullin's Labor Government was overwhelmingly defeated in the Australian general election and a new Cabinet was formed under J. E. Lyons, leader of the United Australia party.

21—Japanese forces in Manchuria inaugurated a drive against Chinchow.

22—Despite a previous promise to hold a presidential election in 1932, President Machado of Cuba announced that he would remain in office until the expiration of his term in 1935.

The Hungarian Government declared a moratorium on foreign debt payments.

A wing of the Vatican library collapsed, killing four persons and destroying many valuable books and records.

The Mexican Federal Chamber of Deputies passed a bill limiting the number of priests who might officiate in the Federal District or the Territory of Lower California to one for every 50,000 inhabitants, effective December 30.

The All-Union Executive Committee of the Soviet Union convened in Moscow to approve plans for completion of the Five-Year Plan during 1932.

23—The report of the Basel committee of experts, appointed by the Bank for International Settlements to investigate Germany's capacity to resume reparation payments, stated that Germany could not resume conditional payments in July, 1932.

24—The International Labor Office at Geneva estimated that 100,000,000 persons, including unemployed and their families, were hungry and destitute.

The U. S. Interstate Commerce Commission authorized the railways to raise freight rates.

25—Troops fired on a menacing mob of "Red Shirts," Indian nationalists, at Utmanzai, near Peshawar, killing eight.

26—The U. S. Senate appointed two subcommittees to study proposals for modifying the prohibition laws. Pius XI, in another encyclical, urged Protestant and Eastern Orthodox churches, to unite with the Roman Catholic Church under Papal authority.

27—The All-Indian Moslem League, at New Delhi, repudiated the new campaign of civil disobedience sponsored by the All-India National Congress.

30—Finland's citizens voted overwhelmingly for repeal of the national prohibition law at a referendum on the issue held December 29 and 30.

The British Government called an international conference at Lausanne, Switzerland, for Jan. 18, 1932, to consider revision of the reparation and war debt settlements

**CITY AND REGIONAL PLANNING.** After ten years of work carried on by engineers, landscape and building architects, municipal and social economists and other specialists, work on the Regional Plan for New York and its Environs was officially announced as completed at a dinner held in December. The region covered is over 5000 square miles in area, lying within a radius of 50 miles of the city hall and is located in 22 counties of three States, New York, New Jersey, and Connecticut, embracing over 400 cities, villages, and towns. Except for the publication of the last two or three of ten volumes of reports, the detail work on the regional plan was completed in 1928. Among the many subjects covered in these reports are past and prospective growth in population of the region and its component parts; major highway systems; ways and means of transportation, including the rapid transit subways, suburban and main line railways, airways, and airports and waterways; parks and parkways; main systems of water supply and sewage disposal. The population of New York and Environs was shown to be over 11,000,000 by the census of 1930 and was estimated to be 20,000,000 in 1960. This great undertaking, by far the largest in the whole history of city and regional planning the world over, was financed by the Russell Sage Foundation and other private contributors and was under the general direction of a committee of notable publicists, headed until his death by Charles D. Norton and subsequently by Frederick A. Delano as chairman. The general director of the plans and surveys was Thomas Adams, a town planner of varied experience in Great Britain, Canada, and the United States.

Another extensive plan completed during the year was that of the Regional Planning Federation of the Philadelphia Tri-State District, carried out within the three years ending in July, 1931, by means of a \$600,000 subscription fund pledged early in 1928. The Philadelphia region embraces 11 counties in Pennsylvania, New Jersey, and Delaware. The work was under the direction of a technical advisory committee of some 200 state, county, city, township, and borough engineering officials together with the leading consulting engineers, architects, and landscape architects of the region. Publication of the report on the plan was postponed until after the completion of a welfare and unemployment campaign in the district. At the close of the year arrangements were being made to raise funds to supplement those still available from the original contributions in order to carry on work during 1932. Planning associations were being formed in the counties in the district not already having them and coöperation was being given by the recently formed Philadelphia City Planning Commission.

The Chicago Regional Planning Commission continued its work during the year as did also other regional commissions in the United States and in England. Progress continued to be made on the execution of the Chicago Plan, made many years ago, promptly put under execution under the Chicago City Plan Commission, a very large citizen organization. Vast sums for the construction of major highways was provided from the treasury on authorization of the voters.

Less expensive prosecution of city planning projects continued to be carried out in various

parts of many cities both in the United States and elsewhere. As an example of what is being done in relatively small places, it may be noted that the village board of Ossining, N. Y., approved a plan in 1931 looking to the establishment of a "model community" in 25 years at a cost of \$4,500,000, the money to be spent in installments. Among the improvements projected are a station plaza, an amphitheatre to be developed on a natural slope as a sort of central community centre; relocation of the Albany Post Road, parks and several new school buildings.

Boulder City, Nev., was put under construction during the year as a model small town to house workers on the construction of the Hoover Dam across the Colorado River (see DAMS). This town is located 25 miles east of Las Vegas, Nev. It is built on land considerably higher than the dam site, in order to get more comfortable living conditions, and overlooks the site of the large body of water that will be formed by the dam (for general plan and description of Boulder City see *National Municipal Review*, May, 1931).

The city of Bogotá, Colombia, engaged a prominent American city planner to make plans for the improvement of that South American city. New Delhi, the new capital city of India, was opened with due ceremonies early in February, 1931, after having been put under construction in the open country some 18 years earlier. The centre of New Delhi was about 2½ miles south of the centre of the ancient city of Delhi. The World War was in part responsible for the long period of construction prior to the official opening (for a description of the new capital, with plans and half tone views, see *Engineering News-Record* Sept. 10, 1931).

The annual survey of progress in city planning and zoning, dated May, 1931, compiled by the Division of Building and Housing of the U. S. Department of Commerce, showed 786 municipalities of the United States having official planning commissions and 981 municipalities having zoning ordinances at the beginning of 1931. In addition there were 67 county or regional planning commissions, official and unofficial, and 38 unofficial city planning boards (for more detailed information on this line of progress, see earlier YEAR BOOKS).

**BIBLIOGRAPHY.** New books appearing during the year included: Hubbard and others, *Airports: Their Location, Administration and Legal Basis* (Cambridge, Mass.); Matzenbaum, *The Law of Zoning* (New York); Lohmann, *Principles of City Planning* (New York); Adams and others, *Buildings: Their Uses and the Spaces About Them*, vol. vi of Regional Survey of New York and Environs (New York); Ford, *Building Height, Bulk and Form* (Cambridge, Mass.); Whitten and Adams, *Neighborhoods of Small Houses* (Cambridge, Mass.).

**CITY GOVERNMENT, CITY MANAGEMENT, ETC.** See MUNICIPAL GOVERNMENT.

**CIVIC FEDERATION, THE NATIONAL.** See NATIONAL CIVIC FEDERATION, THE.

**CIVIL ENGINEERS, AMERICAN SOCIETY OF.** An association of professional engineers, founded in 1852 to advance engineering and architectural knowledge and practice, to maintain high professional standards, and to encourage intercourse between men of practical science. The membership as of Dec. 15, 1931, consisted of 18 honorary members, 5997 members, 6361 associate members, 2825 juniors, 126 affiliates, and 5 fel-

lows. The members included civil, military, naval, mining, mechanical, electrical, and other engineers, in active practice 12 years, and qualified to design as well as to direct engineering work. The associate members were those who had been practicing eight years; the juniors, beginners in the profession; affiliates, persons qualified to co-operate with engineers, but not themselves engineers; fellows, contributors to the permanent funds of the society, who may not be eligible to membership; and honorary members, persons of acknowledged eminence in engineering. There were, in 1931, 53 local sections and 99 affiliated student chapters in colleges throughout the United States.

Four general meetings of the society are held each year, including the annual meeting, annual convention, and spring and fall meetings. At the annual meeting, held in New York City Jan. 21-23, 1931, the following medals and prizes were awarded for papers published in the society's *Transactions*: The Norman Medal, to Charles Terzaghi; the J. James R. Croes Medal, to H. de B. Parsons; the Thomas Fitch Rowland Prize, to Rufus McC. Beanfield; the James Laurie Prize, to John H. Gregory, C. B. Cornell, and C. B. Hoover; and the Arthur M. Wellington Prize, to George Gibbs. At the spring meeting, held in Norfolk, Va., April 15-17, the question of transportation was considered at the general sessions, while at the fall meeting, held in St. Paul, Minn., October 7-10, a study was made of the iron mining industry. The sixty-first annual convention was held in Tacoma, Wash., July 8-11, the chief topic of discussion being the Pacific Northwest. At each of the meetings some sessions were under the direction of one or more of the 10 technical divisions, which presented papers on their special branches of engineering. Seven research committees, with a total personnel of about 60, were engaged throughout the year in special investigations. Nearly 100 members served on joint boards and committees, with representatives of other societies, for research and standardization.

The society publishes two monthly magazines: *Proceedings*, containing technical papers which are later collated, with discussions, in the yearly volume of *Transactions*; and *Civil Engineering*, which presents news of society affairs and articles of more popular appeal. The *Year Book* contains a list of members and general information about the society. A series of *Manuals*, published at irregular intervals, deals with various topics of engineering interest. The officers of the society in 1931 were: President, Francis Lee Stuart; vice presidents, J. M. Howe, Frank E. Winsor, J. N. Chester, and H. M. Waite; secretary, George T. Seabury; treasurer, Otis E. Hovey. Headquarters are in the Engineering Societies Building, 33 West Thirty-ninth Street, New York City, of which, with three other national engineering societies, it is joint owner.

**CIVILIZATION STUDIES.** See PHILOLOGY, MODERN.

**CIVIL SERVICE REFORM LEAGUE, NATIONAL.** Organized in 1881 for the purpose of putting to an end the so-called spoils system of making appointments to public office, this organization has sought to accomplish its end by promoting administrative efficiency through the application of the merit system to the appointment, promotion, and tenure of government officials. It also has advocated, on the principle that public office is a public trust, that those best

fitted through demonstrated ability and capacity should serve the State.

During 1931 the league urged the revocation of the executive order by which employees of the United States Employment Service in the Department of Labor are selected without regard to the civil service law. It persistently protested against filling presidential postmasterships on a political basis and assessing postmasters for political funds. It urged upon the President and his Advisory Committee on Veteran Preference the modification of the executive order increasing the preference given war veterans in civil service positions. It assisted in the adoption of a new civil service law and in drafting civil service rules for Porto Rico.

The league endeavors to secure the adoption and improvement of civil service laws in various States and cities. Reports of its work are issued periodically. *Good Government* is the official organ. The officers in 1931 were: George McAneny, president; W. W. Montgomery, Jr., chairman of the executive committee; Howard R. Guild, chairman of the council; A. S. Frissell, treasurer; and H. Eliot Kaplan, secretary. Headquarters are at 521 Fifth Avenue, New York City.

**CIVITAN INTERNATIONAL.** An organization composed of selected professional and business men, throughout the United States and Canada, who have dedicated themselves to unselfish service to their city, county, State, and nation. The first Civitan club was founded in Birmingham, Ala., in 1917, the word "Civitan" being coined from the Latin "civitas." The motto of the organization is "Builders of Good Citizenship." The organization of field work was begun in 1920, when the international association was formed in Birmingham, and by 1921, when the first annual convention was held, there were 30 clubs. A total of 263 clubs had been chartered by Nov. 1, 1931. The primary requisite for membership is that every applicant be a "duly qualified and registered voter."

Among the outstanding achievements of the Civitan clubs in 1931 were the inauguration of "Sunbeam and Shadows" radio hour. The plan, which was originated by the Miami (Fla.) Civitan Club, consists of broadcasting the appeals of those in distress, by number; these appeals are known as "Shadows," while the responses for the relief of such unfortunates are known as "Sunbeams." The various clubs also continued their work of curbing crime, elimination of tuberculosis, and eradication of Communistic activities wherever found. There were the usual agencies of Big Brothers work, Boy Scout camps, parole of first offenders to Civitans for personal observation, Americanization work, city beautification, sponsoring of essay contests on "Good Citizenship," and, in general, participation in all matters of civic improvement and humanitarian purpose.

The 1931 convention was held in St. Louis, Mo. June 21-24, and the 1932 convention was to be held in Baltimore, Md. The official organ is the *Civitan*, published monthly in Atlanta, Ga., Bruce Moran, editor. The officers for 1931 were: President, Harold Tschudi, Baltimore, Md.; vice presidents, Merton W. Clement, Worcester, Mass., Cary H. Howard, Tulsa, Okla., Claude B. Squires, Charlotte, N. C.; international secretary, Arthur Cundy, Birmingham, Ala.; and international treasurer, Claude L.

Hagan, Birmingham, Ala. Headquarters are at 800 Farley Building, Birmingham, Ala.

**CLARKE, SIR EDWARD GEORGE.** A British lawyer and public official, died Apr. 26, 1931, in London, where he was born Feb. 15, 1841. He received his education at the City of London College and King's College. In 1864 he was called to the bar at Lincoln's Inn, practicing in the Common Law Courts and Surrey Sessions where he won fame through his brilliant handling, as counsel, of the Penge Murder Case (1877); the Adelaide Bartlett Case (1886); the Baccarat Case (1891), in which Edward VII, then Prince of Wales, gave evidence in the slander action brought by Sir W. Gordon-Cumming; and the Jameson Case (1896), in which he defended Dr. Leander Starr Jameson, leader of the raid into the Transvaal in December, 1895. He was knighted in 1886, having become solicitor-general under Lord Salisbury's Conservative administration and holding that office until 1892. He was a member of Parliament for Southwark (1880), for Plymouth (1880-1900), and for the City of London (1906). He retired from the bar in 1914. Among his publications are *Treatise on the Law of Extradition* (1866; 4th ed., 1903); *The Story of My Life* (1918); and *Benjamin Disraeli: The Romance of a Great Career* (1926).

**CLARKE, FRANK WIGGLESWORTH.** An American chemist, died in Chevy Chase, Md., May 23, 1931. He was born in Boston, Mass., Mar. 19, 1847, and was graduated from the Lawrence Scientific School, Harvard University, in 1867. He was an instructor at Cornell University in 1869, professor of chemistry at Howard University in 1873-74, and professor of chemistry and physics at the University of Cincinnati from 1874 to 1883, when he was appointed chief chemist of the U. S. Geological Survey and honorary curator of minerals in the U. S. National Museum. In 1900 he was a member of the Paris Exposition international jury of awards; in 1901, president of the American Chemical Society; and in 1903, Wilde medallist of the Manchester (England) Literary and Philosophical Society. He was joint author with Louis M. Dennis of *Elementary Chemistry* (1902) and author of *The Constants of Nature* (5 vols., 1873-82) and of various bulletins of the Geological Survey and many papers on chemistry and mineralogy.

**CLARKEITE.** See MINERALOGY.

**CLARK UNIVERSITY.** A nonsectarian university in Worcester, Mass., founded in 1889. It comprises a college for men, a coeducational graduate division of arts and sciences, and a coeducational senior college (extension courses) granting the degree of bachelor of education. The registration for the autumn of 1931 was 494 including 236 undergraduates, 82 graduate students, 21 special students, and 155 extension students. The enrollment for the summer session was 300. There were 40 members on the faculty. The productive funds amounted to approximately \$5,000,000. The library contained 137,000 volumes. President, Wallace W. Atwood, Ph.D.

**CLASSICAL ANTIQUITIES.** See ARCHÆOLOGY.

**CLASSICAL STUDIES.** See PHILOLOGY, CLASSICAL.

**CLEVELAND, OHIO.** See MUNICIPAL GOVERNMENT.

**CLEVELAND COLLEGE.** See WESTERN RESERVE UNIVERSITY.

**CLIMATE.** See METEOROLOGY.

**CLIPPERTON ISLAND.** An island in the Pacific, situated some 500 miles southwest of Mexico and 1500 miles northwest of the Panama Canal. In dispute between Mexico and France, it was awarded to France in January, 1931, by the King of Italy acting as arbitrator. It is less than a square mile in area, with 30 inhabitants, and has small phosphate deposits.

**CLOUD STUDIES.** See METEOROLOGY.

**COAL.** With disturbed economic conditions and decreased industrial activity world-wide, it was

inevitable that the production of coal should be further curtailed in 1931 and that there should be a further decline in the production from the statistics for 1930 as shown compared with earlier years in the accompanying table. With reduced production and demand labor difficulties in some countries and fields developed, and these were often serious, at least from the economic standpoint especially where the costs of production were high in comparison with the return for the coal mined. See GREAT BRITAIN under *History*.

**COAL AND LIGNITE PRODUCED IN THE PRINCIPAL COUNTRIES OF THE WORLD IN THE CALENDAR YEARS 1926-1930, IN METRIC TONS**

<sup>a</sup> Estimate included in total.

<sup>b</sup> Approximate production.

<sup>c</sup> Exclusive of output of State of Falcón (about 8,000 tons), for which estimate is included in total.

<sup>d</sup> Exclusive of minus in the Saar under French control.

<sup>e</sup> Mines under French control.

<sup>f</sup> Year ended September 30.

<sup>g</sup> Production less consumption at mines, for which data are not available.

<sup>h</sup> Exports.

<sup>i</sup> Exclusive of Sakhalin.

<sup>j</sup> Shipments.

PRODUCTION OF SOFT COAL IN 1931. The total production of soft coal during 1931, including lignite and coal coked at the mines, was estimated by the U. S. Bureau of Mines at 378,110,000 net tons. The figure represented the sum of the Bureau's current estimate for the fifty-two weeks in the year. In comparison with the output in 1930, as shown by the annual canvass of the mines for that year, the estimate for 1931 showed a decrease of 89,416,000 tons or 19.1 per cent. It was the lowest since 1909 when 379,944,000 tons were mined. The total production for years 1925-30 was as follows:

Net tons	Net tons
1930 .....	467,526,000
1929 .....	534,989,000
1928 .....	500,745,000
1927 .....	517,763,000
1926 .....	573,367,000
1925 .....	520,053,000

According to the annual summary in the *Coal Age* (New York), the greater part of the decrease in bituminous produced during 1931 was due to

diminished industrial consumption. The portion taken by the railroads as locomotive fuel, normally about 24 per cent, showed a decline of about 17 per cent, being only 81,200,000 tons consumed in road, train, and yard switching service as against 97,857,000 tons in 1930. Likewise, with the public utilities normally taking about 11 per cent of the total output, their consumption in 1931 was estimated about 38,900,000 tons, or a decrease of 9.3 per cent from the 1930 total of 42,898,000 tons. In the production of pig iron and ferro-alloys, normally requiring about 10 per cent of the annual output, the consumption dropped from 47,300,000 gross tons in 1930 to an estimated 27,800,000 tons in 1931, a decline of 41.3 per cent. These three industries, which in normal times represent 45 per cent of the production and 60 per cent of the industrial consumption, accordingly witnessed a decrease of from 188,055,000 tons in 1930 to 147,902,000 tons in 1931.

With lessened production it was inevitable that there should be a fall in the price in the bitumi-

nous markets, which was estimated at an average of 5.8 per cent, or from \$1.75 a ton in 1930 to \$1.65 in 1931. Naturally there were cuts in the wages in some non-union fields, resulting in bitter disputes between operators and employees. The conditions involved in the distress among the miners and competitive conditions in the bituminous industry led to serious discussion of plans for stability of employment, wage scales, and prices, with agitation for Federal legislation to regulate the industry on the part of the miners. Towards the end of the year the National Coal Association adopted a plan providing for physical mergers of properties in the different districts and as a preliminary measure the formation of district sale agencies. These and other plans, including the development of a sales agency somewhat resembling a trust, were in progress at the end of the year.

**ANTHRACITE PRODUCTION IN 1931.** The total of the Bureau of Mines' current estimates of production of Pennsylvania anthracite for the fifty-two weeks of 1931 amounted to 59,531,000 net tons. In comparison with the operators' final reports for 1930, the current estimate for 1931 showed a decrease of 9,854,000 tons, or 14.2 per cent. The decrease was much smaller than that for bituminous coal or for business in general, indicating that the anthracite industry had been comparatively stable during the great depression.

The estimate was based on weekly reports of cars of anthracite loaded by the nine originating carriers, and included an allowance for colliery fuel and local sales within the anthracite region, and for dredge and washery coal. The total output in recent years (as reported by the operators) was as follows:

Net tons		Net tons	
1930 .....	69,385,000	1928 .....	75,348,000
1929 .....	78,828,000	1927 .....	80,096,000

As in 1929 and 1930, activity in the anthracite industry in 1931 was chiefly along the lines of preparation for the future, since, due to the continuance of the general depression which naturally affected, though indirectly, the consumption of anthracite, and to relatively high temperatures during the earlier and later months of the year, production was at the lowest point in the present century, except for the strike years of 1902, 1922, and 1925. See **STRIKES AND LOCK-OUTS**.

How much of the decreases from earlier years was due to the effects of the depression and of moderate temperatures during the winter months on the one hand and to the competition of other fuels (bituminous coal, coke, fuel oil, and gas—natural and artificial) on the other, it was of course impossible to say. All influenced the consumption of anthracite to some extent, but it was assumed that the losses due to the first two influences represented more than 50 per cent of the total. Excesses of temperature of from 1200 to 1500 degrees above normal during the year, much of which were in the supposedly coal-burning months of October and November, and extending through the greater part of December, necessarily resulted in the consumption of less fuel for heating purposes. Furthermore enforced economy in the use of coal on the part of householders with moderate incomes, which had been materially reduced through the economic

conditions, contributed to the decreased production of anthracite in 1931 as in 1930. It is on the householders with modest incomes in the medium sized towns and in the rural districts throughout the New England and Middle Atlantic States that the anthracite industry largely depends, and the unfavorable situation in 1931 was clearly evinced in the almost negligible advantage taken of the reduced prices during the summer months, and the usual laying by of coal, during the summer, for the winter months was conspicuous by its absence.

Shipments of anthracite for the full year 1931, as reported by the carriers to the Anthracite Bureau of Information, amounted to 47,878,500 gross tons as compared with 49,456,323 tons in 1930. Shipments by months from Jan. 1, 1930, to Dec. 31, 1931, were as follows:

## SHIPMENTS OF ANTHRACITE

	1930	1931
January .....	5,405,788	5,054,819
February .....	4,708,707	4,895,183
March .....	3,430,940	3,898,578

November .....	4,200,047	3,319,758
December .....	4,889,057	3,759,217
Total .....	54,845,880	47,878,500

For the first time in the history of the industry, the U. S. Bureau of Mines was taking part in a detailed study of Pennsylvania anthracite. In coöperation with Professor Turner, the Bureau of Mines took face samples of all the beds in the central portions and eastern and western extremes of the four great anthracite basins. The Pittsburgh Station of the Bureau of Mines completed proximate analyses, ultimate analyses, calorific determinations, and ash softening temperatures on all these samples. A large number of samples were also taken for a study of friability to be made by the U. S. Bureau of Mines.

The U. S. Bureau of Mines compiled during the year a report on *Anthracite in 1930* by Ellery B. Gordon and H. L. Bennit which includes, in addition to the standard tables of production, value, men employed, days worked, etc., a number of significant summaries on the anthracite situation dealing with Incursion of competitive fuels, Decline in retail prices, Important distribution channels, Anthracite's effort to meet competition.

On the score of safety, the coal mines of the United States made the best record in the history of the industry. A total for the year of the bituminous mines involved 1050 deaths as against 1619 in 1930, and 380 deaths in the Pennsylvania anthracite district as against 444 in the year before. These figures gave a total of 3.208 fatalities per million tons mined as against 3.842 fatalities per million tons in 1930. During 1931 there were five major disasters in which 51 deaths resulted, a major disaster being considered one in which five or more lives were lost.

Coal production in Canada also suffered a decline in 1931, amounting to 12,212,000 tons as compared with 14,880,000 tons in 1930 and 17,496,000 tons in 1929. The imports during 1931 totaled 13,532,000 tons, of which the United States furnished 12,467,000 tons.

PRODUCTION, VALUE, MEN EMPLOYED, DAYS WORKED, AND OUTPUT PER MAN PER DAY AT  
COAL MINES IN THE UNITED STATES IN 1930

\* The figures relate only to active mines of commercial size that produced bituminous coal in 1930. The number of such mines in the United States was 5,891 in 1930; 6,057 in 1929; and 6,450 in 1928.

Methods of mining in 1930: The tonnage by hand was 55,489,908; shot off the solid, 29,105,549; cut by machines, 362,425,163; mined by stripping, 19,842,359, not specified, 663,320.

Size classes of commercial mines in 1930: There were 173 mines in Class 1A (500,000 tons and over) producing 27.7 per cent of the tonnage, 543 in Class 1B (200,000 to 500,000 tons) with 35.4 per cent; 608 in Class 2 (100,000 to 200,000 tons) with 18.6 per cent, 644 in Class 3 (50,000 to 100,000 tons) with 9.9 per cent, 1,238 in Class 4 (10,000 to 50,000 tons) with 6.7 per cent; 2,685 in Class 5 (less than 10,000 tons) producing 1.7 per cent.

<sup>b</sup> Figures for 1931 are estimates.

The coal industry in Great Britain in 1931 suffered relatively less than in the United States and Germany. Preliminary statistics for Great Britain gave a production of 220,156,000 long tons in 1931 as compared with 243,881,824 tons in 1930, and with 276,000,560 tons in 1923, the highest record of recent years. In 1931 coal exports from Great Britain amounted to 42,749,740 tons as against 54,874,065 tons in 1930, a decline of 22 per cent, and 47 per cent from 79,459,469 tons, the postwar record of 1923. In 1931, bunker coal totaled 14,609,545 tons as compared with 18,259,027 tons in 1922, the postwar peak. The operation of the Coal Mines Act of 1930, which came into effect during 1931, is discussed under GREAT BRITAIN.

**COBB, HENRY IVES.** An American architect, died in New York City, Mar. 27, 1931. He was born in Brookline, Mass., Aug. 19, 1859, and attended the Massachusetts Institute of Technology and Harvard University, being graduated from the latter in 1880. Beginning his practice in Chicago in 1881, he was architect for the Chicago Opera House, the Newberry Library, the Church of the Atonement, the city hall, the court house, and the University of Chicago. In 1893 he was one of the National Board of Architects for the World's Columbian Exposition, and designed the Horticultural Hall, Fisheries Building, and the Massachusetts State Building. He was retained as special architect by the U. S. Government during 1893-1903, designing the Federal Building in Chicago and other government edifices. He also designed the Pennsylvania State Capitol, the Albany (N. Y.) Savings Bank, the Booth Memorial Theatre, the Harriman Bank Building, and the Sinclair Oil Building in New York City, and buildings of the American University in Washington. He had been engaged in practice in New York City since 1902.

**COCCIDIOSIS.** See VETERINARY MEDICINE.

**COCHIN-CHINA,** k'och'in-Ch'i'na. The southernmost colony in French Indo-China. Area, estimated at 24,700 square miles; population, estimated in 1929 at 4,392,886, of whom 16,402 were French (excluding military forces) and the remainder chiefly Annamites, Cambodians, Moïs, Chams, and Chinese. Saigon, the capital, had a population in 1929 of 123,890, including 12,100 French, but excluding 3066 troops. Cholon had 193,400 inhabitants. Schools numbered 1584, with 190,275 pupils, in 1930.

Agriculture is the principal occupation and rice the chief crop, to which was devoted most of the 5,221,727 acres under cultivation. Rice production in 1929 was 2,164,249 metric tons. Maize, sweet potatoes, beans, cotton, sugar-cane, rubber, tobacco, and coffee are other crops. The output of the fisheries is valued at about 3,000,000 francs annually. Livestock in 1929 included 422,921 buffaloes, 576,546 swine, and 10,701 horses. Total exports in 1929 were valued at 2,426,842,000 francs, compared with 2,798,975,000 francs in 1928, and imports at 2,301,020,000 francs (2,283,241,000 francs in 1928). One franc equals about \$0.039. The local budget for 1929 balanced at 22,513,626 piasters (the piaster was stabilized at \$0.392 on May 31, 1930). A total of 859 steamers of 2,106,231 tons entered Saigon, the chief port, in 1929. The territory is ruled directly by a governor and a colonial council of 24 members; it is represented in the French Parliament by one deputy. Governor in 1931, J. F. Krauthimer, appointed in 1929. See FRENCH INDO-CHINA.

**COCOS or KEELING ISLANDS.** See STRAITS SETTLEMENTS.

**CODLING MOTH.** See ENTOMOLOGY, ECONOMIC.

**COELENTERATES.** See ZOÖLOGY.

**COFFEE.** See BRAZIL; COLOMBIA; COSTA RICA.

**COFFER DAMS.** See FOUNDATIONS.

**COINS, VALUE OF FOREIGN.** The legal estimates of the value of foreign coins on Jan. 1, 1932, as issued by the U. S. Secretary of the Treasury are given in the table on page 217.

**COKE.** The production of coke in the United States in 1931, according to estimates of the U. S. Bureau of Mines, was 33,728,504 net tons, a decrease of 20.8 per cent when compared with 1930, and the smallest amount since 1921 when but 25,287,622 tons were produced, this in turn being the smallest amount since 1904. The chief cause of the decrease in coke production was the continued reduced activity of blast furnaces, the output of pig iron for 1931 decreasing 41.8 per cent below the level of 1930, and amounting to but 18,500,000 gross tons. The production of beehive coke was 1,273,900 net tons in 1931, the lowest since 1880, and less than half the output of 1930. It was but 3.8 per cent of the total, whereas in 1913 it was 72.5 per cent as against 27.5 per cent for by-product coke. Pennsylvania, with 1,007,600 tons, was the leading State in the production of beehive coke, and the combined output of Pennsylvania and West Virginia in 1931 represented about 88 per cent of the total. Pennsylvania was also the largest producer of by-product coke. The output of its by-product ovens in 1931 was 7,519,000 tons. As a producer of by-product coke, Ohio ranked second, New York third, Alabama fourth, and Indiana fifth. The details are given in Table II.

There were no new by-product coke plants starting operation in the United States during 1931. There were, however, three new installations of ovens at existing plants as follows: In January the Consolidated Gas Company added 37 Koppers ovens to its equipment at Hunts Point, N. Y.; in the same month the Hudson Valley Fuel Corporation fired 31 new Koppers ovens at Troy, N. Y.; in November there were 25 Semet-Solvay ovens added to the plant of the Ironton By-Product Coke Company at Ironton, Ohio. The total number of ovens added by these operations was 93. In addition, 295 new ovens were completed at four of the existing plants, but not put into operation. No new ovens were under construction at the close of 1931. Including the new ovens completed in 1931, the potential coking capacity of by-product plants at the close of the year, at 100 per cent operation and with all conditions favorable, amounted to nearly 64,000,000 net tons. At this rate the plants in existence had a carbonizing capacity of 91,000,000 tons of coal. In 1931, 46 plants connected with iron furnaces produced 20,855,500 tons, or 64.3 per cent of the total by-product output. The remaining 42 non-furnace plants produced 11,599,100 tons, or 35.7 per cent of the total. Preliminary estimates on the recovery of by-products from coke-oven operations in 1931, obtained by assuming that the quantity of by-products recovered during 1931 bore the same relation to the known production of coke in 1931 as in 1930, give the following:

Tar .....	gallons.	431,646,000
Ammonia (sulphate equivalent of all forms) .....	pounds.	1,103,457,000
Gas .....	M cu. ft.	519,274,000
Crude light oil .....	gallons.	128,196,000

The indicated consumption of coke in 1931 was 31,917,126 tons, of which about 18,700,000 tons was consumed by blast furnaces in the manufacture of pig iron. The remainder was used in foundries, in smelting the non-ferrous metals, in the manufacture of water gas, in miscellaneous other industrial uses, and for domestic heating. In 1931 the quantity consumed for these purposes was about 13,217,126 tons, or 41.4 per cent of the total, as against 8,221,000 tons, or 18.1 per cent, in 1913. The consumption for house heating was probably as great as, or greater than, in 1930. In that year 7,886,432 tons of by-product and 141,391 tons of beehive coke were sold for domestic use, a total of 8,027,823 tons. For 1931 the consumption of raw coal required by the coke ovens of the United States was estimated at 48,631,600 tons, or 12.9 per cent of the entire production of bituminous coal.

In Canada coke production in 1931 amounted to 1,835,000 tons, a decline of 23 per cent from 1930, while the imports during the year amounted to 733,000 tons, a decline of about 30 per cent.

**COLE, TIMOTHY.** An American wood engraver, died in Poughkeepsie, N. Y., May 17, 1931. He was born in London, England, in 1852 and was brought to the United States five years later. After studying under Bond and Chandler, he established himself in Chicago, but his studio was destroyed in the great fire of 1871. Removing to New York City, he began in 1875 to contribute to the *Century Magazine* (then *Scribner's*) the series of wood-cut illustrations that

made him famous. In 1883 he was sent by his publishers to Europe to reproduce the works of the old masters, from the originals in European galleries. His first series, the "Old Italian Masters," finished in 1892, was followed by the Dutch and Flemish series in 1896 and the English series in 1900. The "Old Spanish Masters" series was completed in 1907 and the French series in 1910. From 1910 on he was engaged in reproducing the old masters in American public and private galleries. In addition to receiving the first class gold medal at the Paris Exposition in 1900 and the grand prix at the St. Louis Exposition in 1904, he was made a member of the National Academy in 1908 and of the American Academy of Arts and Letters in 1913 and was also an honorary member of the Society of Sculptors, Painters, and Engravers of London. Cole was considered by many critics the best of modern engravers. He was especially effective in his use of the white line and in reproducing textures, giving the intimate qualities of each school so that there was no mistaking one for another, and yet retaining his own individuality. He published, with his own illustrations, *Wood Engraving: Three Essays* (1916) and *The Magic Line: A Study of the Technique of Wood Engraving* (1917).

**COLGATE UNIVERSITY.** A nonsectarian institution for the higher education of men in Hamilton, N. Y., founded in 1819. In the autumn of 1931 there were 1005 students enrolled. The faculty numbered 93 members. The productive funds amounted to approximately \$6,500,000, and the income for the year was approximately \$500,000. The library contained 110,000 volumes. President, George Barton Cutten, Ph.D., D.D., LL.D.

**COLOMBIA.** A republic of northwestern South America, third in population and fourth in size among the countries of that continent; touching boundaries with Panama, Venezuela, Brazil, Peru, and Ecuador. Capital, Bogotá.

**AREA AND POPULATION.** The area of Colombia is variously estimated at from 444,200 to 447,536 square miles. The population according to the census of December, 1928, was 7,851,000, as compared with 5,855,077 in 1918. The total population was distributed as follows: whites, 20 per cent; Negroes, 5 per cent; Indians, 7 per cent; mulattoes, 18 per cent; mestizos, 50 per cent. Bogotá, the capital, had a population of 235,421 at the 1928 census. Other leading cities, with their populations in 1928, were: Barranquilla, 139,974; Cali, 122,847; Medellín, 120,044; Cartagena, 92,494; Manizales, 81,091; Ibagué, 56,333; Cucuta, 49,279; and Bucaramanga, 44,083. Immigration is negligible. Foreigners in the country in 1928 numbered 35,251, including 1607 citizens of the United States and 14,743 Venezuelans.

**EDUCATION.** Of the population over 10 years of age, 51.57 per cent were literate in 1928, compared with 32 per cent at the census of 1918. Education throughout the Republic is centralized under the Minister of Education, elementary education being free but not compulsory. Primary and secondary schools in 1927 numbered 7531,

with 449,111 pupils. There were in addition 25 industrial schools, 6 art schools, and 17 normal schools. National or departmental universities are maintained at Bogotá, Medellín, Cartagena, Papayan, and Pasto. Roman Catholicism is the state religion and the Church exercises control of practically all the national or partly national secondary schools.

**PRODUCTION.** Although only a small part of the available soil is cultivated, Colombia is primarily an agricultural country, with coffee as the chief factor in the national economy. Due to its mild flavor, the price of Colombian coffee is largely unaffected by Brazilian overproduction. Coffee normally accounts for about 60 per cent of the total value of exports and more than 80 per cent of the coffee crop is consumed annually in the United States. Coffee production in 1930 was 467,667,000 pounds, compared with 417,996,000 pounds in 1929. However prices in the New York market were lower, and the value of 354,114,023 pounds shipped to the United States in 1930 was \$72,460,940, compared with \$78,810,950 received for 311,518,400 pounds in 1929. Crude petroleum and bananas are the other leading export products. Banana exports for 1929 and 1930 totaled about 11,200,000 stems each year. Other crops include tobacco, cotton, cacao, sugar, vegetable ivory, rubber, rice, wheat, and maize, besides a great variety of fruits.

In 1930 Colombia was one of the world's largest producers of emeralds and platinum; among the South American countries it was the largest producer of gold and ranked second to Venezuela in the production of petroleum, with an output of 20,346,000 barrels. Copper, lead, mercury, cinnabar, manganese, coal, iron, and salt are also mined. Coal resources are estimated at 27,000,000,000 metric tons and production is about 35,000,000 tons annually. Forests cover about 150,000,000 acres. There are valuable pearl fisheries under government control. The economic depression in Colombia became more acute during 1931, as prices for export products continued to decline, and there was a general decrease in all classes of revenues. Petroleum production in 1931 declined to about 18,000,000 barrels.

**COMMERCE.** Official statistics for 1930 placed the value of Colombian exports at 112,709,000 pesos, compared with 126,872,000 pesos in 1929, and the value of imports at 62,841,000 pesos, compared with 126,377,000 pesos the previous year (1 peso exchanged at \$0.9655 in 1929). Colombia purchased from the United States goods to the value of \$24,677,613 in 1930 (\$48,070,000 in 1929) and exported to the United States goods totaling \$97,139,000 (\$103,525,000 in 1929). Although the volume of exports of coffee and petroleum increased, as compared with 1929, the value declined as a result of low market prices. Coffee exports in 1930 totaled 3,118,000 bags (1 bag equaled 132 pounds), valued at 63,598,000 pesos, while the 1929 exports of 2,836,000 bags were valued at 70,885,000 pesos. Crude petroleum exports in 1930 totaled 19,113,000 barrels (of 42 gallons), valued at 26,300,000 pesos; 1929 exports, 18,803,000 barrels, valued at 27,016,000 pesos. The favorable balance of trade was 49,867,458 pesos in 1930, compared with 494,955 pesos in 1929.

During 1931, the value of imports continued to decline while that of exports remained fairly even, due to large coffee exports. The United States maintained its relative position in Colom-

bia's foreign trade, purchasing about 80 per cent of the exports and supplying nearly 50 per cent of the imports.

**FINANCE.** According to the comptroller's report covering fiscal operations during 1930, the year opened with a Treasury deficit of 17,993,003 pesos (1 peso equals \$0.9733 at par). Expenditures during 1930, including 12,604,000 pesos reserved for obligations contracted, totaled 61,991,755 pesos. Revenues amounted to 49,357,917 pesos, leaving a budgetary deficit for the year of 12,633,838 pesos. When the deficit from 1929 was added, the cumulative deficit on Dec. 31, 1930, was 30,626,841 pesos. Through the issuance of Treasury notes, the deficit at the end of 1930 was reduced to 25,633,408 pesos. The deficit was covered by short-term loans aggregating \$20,000,000 raised in the United States, a Treasury issue of 6,000,000 pesos, and receipts from other sources.

The budget for 1931, as voted by Congress Dec. 15, 1930, was estimated to balance at 51,739,925 pesos. Revenues continued to decline, however, and although the budget was subsequently revised downward to approximately 48,000,000 pesos, the year ended with a deficit provisionally estimated at between 2,000,000 and 2,500,000 pesos. The budget for 1932, signed on Dec. 22, 1931, by the Minister of Finance, was based on estimated revenues of about 37,150,000 pesos, exclusive of income from the national railways calculated at about 8,500,000 pesos.

The comptroller's report for 1930 placed the debt of the National government on Dec. 31, 1930, at 95,526,221 pesos, including the internal debt of 20,913,370 pesos, the external debt of 66,151,380 pesos, loans of gradual amortization amounting to 530,762 pesos, and paper money in circulation aggregating 7,930,709 pesos. In addition, there was an excess of current liabilities over current assets of 25,633,408 pesos, representing the accumulated deficit. Outstanding long-term loans of the National government, the departments, municipalities, and the Agricultural Mortgage Bank totaled about 176,902,494 pesos, compared with 181,701,738 pesos at the end of 1929, according to calculations of the *Banco de la Republica*. This sum did not include foreign borrowings of Colombian banks, totaling 42,416,943 pesos on June 30, 1930. About 88 per cent of the foreign debt was floated in the United States. For the financial problems of the National government in 1931, see under *History*.

**COMMUNICATIONS.** Railways in operation during 1930 reported about 1750 miles of line, divided into 11 national and 3 British-owned systems, the government-owned lines comprising more than half of the total. Construction of a 152-mile line from Bogotá to Sogamozo (Sugamuxi), sacred city of the Chibchas Indians, was under way during 1931. Effective Feb. 18, 1931, a board of five members to manage on a commercial basis all railways owned by the National government was established by act of Congress. Most of the lines serve as feeders to the Magdalena River, which is navigable for 900 miles and offers the main traffic route from the Caribbean to the interior. A contract for further dredging of the mouth of the Magdalena at Barranquilla was signed Nov. 18, 1931.

In 1930, there were 19,261 miles of highways, of which 2340 miles were motor roads; the re-

mainder were graded and were used chiefly for other types of traffic. Air lines linked the ports of Barranquilla and Buenaventura, connecting also with Girardot, Bucaramanga, and other interior points. In 1930, air-mail planes flew 726,263 miles and carried 4791 passengers. A new air route between Medellín and Aruba was authorized by the government in 1931, and a direct air service between Bogotá and the United States was inaugurated. Medellín was linked with the All American Cables system Nov. 7, 1931, and the government-owned wireless telegraph station at Cartagena was reopened March 4.

**GOVERNMENT.** Executive power is vested in a president elected for four years by direct popular vote, and ineligible for reelection until four years after the expiration of his term. Legislative power rests with a Congress of two Houses, the Senate and House of Representatives. Senators are elected for four years by the departmental Assemblies, under a new law promulgated Nov. 20, 1930, there being one for every 120,000 inhabitants. Deputies are elected for two years by direct suffrage in the proportion of one to every 50,000 inhabitants. Previous to the election of 1931 (see under *History*) there were 48 members in the Senate (33 Conservatives and 15 Liberals) and 112 members in the House of Representatives (75 Conservatives and 37 Liberals). President in 1931, Dr. Enrique Olaya Herrera (Liberal), elected for the term expiring Aug. 7, 1934.

#### HISTORY

**POLITICAL DEVELOPMENTS.** Three separate elections kept Colombia in a state of intense political agitation and turmoil throughout 1931. The Liberal gains, manifested in the election of President Olaya Herrera in 1930 after a half century of Conservative dominance, were continued in elections to the department legislative assemblies (February 1), the National House of Representatives (May 2), and in the municipal elections (October 4). Violent encounters between political factions marked the electoral campaigns.

In the bitter campaign previous to the departmental elections, 50 persons were killed and many wounded, while the election day casualties were 32 killed and 58 wounded, the highest toll in the recent history of the Republic. Of the 828,000 votes cast, the Liberals won a majority of about 50 per cent but captured only 6 of the 14 departments. This result was attributed to gerrymandering, on the part of Conservatives controlling the election boards. In the elections to the National Senate, which took place in the department assemblies in March, the Conservative majority in the Senate was cut from 18 to 16. Liberal gains were more spectacular in the elections of May 2 to the National House of Representatives, the membership of which had been increased to 118. The previous Conservative majority of 38 was virtually eliminated and with the aid of a group of Conservatives led by Senator Roman Gomez, the Liberals were able to organize both Houses when the new Congress convened July 20. The Liberals claimed victory in every municipality except Pasto in the popular municipal elections of October 4. In Tunja, capital of the department of Boyaca, the Liberals ousted a Conservative administration which had been in office 30 years. Elections clashes resulted

in 19 deaths and injuries to more than 50. A number of Communist outbreaks also were reported during the year.

The major problems facing President Olaya Herrera during the year were political and financial. His political leadership aroused general approval. He continued his policy of dividing Cabinet posts between the two major parties with considerable success but the attempt to apply it in his appointment of the Governors of the 14 departments aroused much opposition. In his message to the newly convened Congress on July 20, the President called for a constitutional amendment in order to separate the judiciary from politics. He urged more intelligent budgeting, Congressional limitation of public expenditures, elimination of national subsidies to the departments, enactment of additional financial recommendations of the Kemmerer Commission of 1930, the reform of the civil code to improve the status of women, and increased efficiency in municipal governments. Congress on October 17 enacted a new judicial code, which became effective Jan. 1, 1932.

Reorganization of the Cabinet took place July 28, following the resignation of the former Ministry July 24. The new Cabinet was headed by Gen. Augustin Morales Olaya, Conservative leader, as Minister of Government. Other members were: Foreign Relations, Roberto Urdaneta Arbelaez; Finance, Jesus Maria Marulanda; War, Carlos Adolfo Urueta; Education, Julio Carizosa Valenzuela; Communications, Alberto Pumarejo; Public Works, Alfonso Araujo; Industries, Francisco Chaux. Dr. Urueta (*q.v.*) died September 13. He was succeeded by Carlos Arango Valez. On November 27 Esteban Jaramillo succeeded to the Finance portfolio.

President Olaya Herrera's financial policies aroused more opposition than did his political moves. Despite dwindling revenues, necessitating drastic economies and salary reductions, he vigorously opposed the growing agitation for a moratorium on foreign debt payments and for the abandonment of the gold standard. Congress on September 24 gave the President virtually dictatorial financial power to combat the economic depression, and on the same day he barred the export of gold from the country. These emergency steps were precipitated by the suspension during the same week of gold payments by the Bank of England. By subsequent decrees the President restricted the export of gold to the *Banco de la Republica*, limited foreign exchange operations, and ordered Colombian banks to invest all their capital, reserves, and deposits in Colombia. Tariff rates were sharply increased and importation of luxury articles was forbidden in order to redress the adverse balance of international payments. Control of exports was established to prevent the export of capital in the form of marketable products. Another decree of November 28 further restricted foreign exchange operations to a point which virtually suspended payments on private foreign debts due after Sept. 24, 1931, including the service on \$16,000,000 of bonds of private mortgage banks outstanding in the United States.

Before adjourning November 24, Congress extended to July 31, 1932, the law conferring emergency financial powers upon the President. He was also authorized to establish a match monopoly, negotiations for which had been opened with a Swedish match company, and to adjust na-

tional, but not departmental and municipal, taxes. Congress extended aid to hard-pressed agriculturists in the form of an agricultural credit institution, with an authorized capital of \$10,000,000, of which the government was to subscribe \$2,000,000 immediately. Unable to raise a foreign loan on satisfactory terms, President Olaya Herrera announced on December 9 that the government would negotiate a loan from the *Banco de la Republica*. In October, a group of official bankers were induced to extend until Dec. 31, 1931, short-term loans aggregating about \$18,500,000.

**PETROLEUM LEGISLATION.** A new petroleum law, signed by the President Mar. 4, 1931, declared the petroleum industry to be a public utility and regulated the activities of all operators. It provided that operators must submit to the government all data of a scientific, technical, economic, or statistical nature, that qualified Colombian citizens be preferred for administrative positions in all petroleum companies, and that Colombian laborers be preferred to foreign laborers except in special instances. Foreign companies were required to accept Colombian law and court decisions on all matters concerning the industry. Petroleum exports were to be duty exempt during the first 30 years of exploitation of a concession. Concessions were limited to an area of from 5000 to 50,000 hectares (hectare equals 2.47 acres) for each person, and the transfer of any concession to a foreign government was prohibited.

Following passage of the law, the Sinclair Exploration Company and the Texas Company, both American concerns, withdrew from Colombia on the ostensible ground that the law was inequitable. The Standard Oil interests, on the other hand, maintained that the law was equitable. The 50-year concession contract of the Gulf Oil Company, also American, for petroleum development of national lands in the Catatumbo region, superseding the Barco concession of 1905, was finally approved by Congress July 17. Congressional action on the measure followed one of the most intense public debates in a generation.

**FOREIGN RELATIONS.** The renewal of diplomatic relations with Ecuador, a cardinal point in President Olaya Herrera's inaugural message, was consummated Aug. 18, 1931. Relations were broken off in 1925 after Colombia had ratified a treaty recognizing Peruvian sovereignty over several thousand square miles of territory in the Amazon valley which Ecuador had previously ceded to Colombia. The Ecuadorean government held that Colombia had no right to dispose of the territory except by recession to Ecuador. In his message to Congress of July 20, 1931, President Olaya Herrera announced that three boundary commissions were engaged in demarcating Colombia's boundaries with Brazil and Venezuela as agreed upon by treaties, thus bringing to an end disputes more than a century old. Good relations with the United States remained a cardinal point in the President's policy. In June, 1931, Dr. Fabio Lozano, former Foreign Minister of Colombia, assumed the duties of Minister to Washington. Consult James F. Rippey, *The Capitalists and Colombia* (New York, 1931).

**COLONIAL EXPOSITION.** See EXPOSITIONS.

**COLONIAL NATIONAL MONUMENT.** See PARKS, NATIONAL.

**COLON ISLANDS.** See ECUADOR.

**COLORADO. POPULATION.** According to the Fifteenth Census, the population of the State on Apr. 1, 1930, was 1,035,791; in 1920, it was 939,629. Its composition, by origin, in 1930, was: Native white, 875,711; foreign-born white, 85,406; Negro, 11,828; Mexican, 57,676; Japanese, 3213; Indian, 1395; also, smaller numbers of Chinese, Filipinos and others. Of 402,894 persons listed as having gainful occupations, 106,234 were workers in agriculture, 58,532 being farmers. Manufacturing and mechanical industries furnished an occupation to 68,783; trade, to 67,130; professional service, to 36,238; domestic and personal service, to 39,292; mineral industries, to 20,045; transportation, to 42,859.

Denver, the capital city, had 79,879 inhabitants (1930); 61,916 (1920). Pueblo, 12,360 (1930); 10,484 (1920). Colorado Springs, 10,048 (1930); 8332 (1920).

**AGRICULTURE.** The following table shows the acreage, production, and value of the principal crops in 1931 and 1930:

Crop	Year	Acreage	Prod Bu.	Value
Hay, tame ..	1931	1,258,000	1,647,000 <sup>a</sup>	\$12,517,000
	1930	1,292,000	2,215,000 <sup>a</sup>	20,378,000
Wheat .....	1931	1,894,000	16,552,000	7,176,000
	1930	1,632,000	23,356,000	12,420,000
Sugar beets ..	1931	226,000	2,537,000 <sup>a</sup>	.....
	1930	242,000	3,312,000 <sup>a</sup>	22,873,000
Corn .....	1931	1,836,000	19,278,000	7,711,000
	1930	1,732,000	38,970,000	24,161,000
Potatoes ...	1931	101,000	9,595,000	2,828,000
	1930	92,000	17,480,000	10,438,000
Barley .....	1931	458,000	7,099,000	2,201,000
	1930	572,000	12,298,000	4,919,000
Dry beans ..	1931	320,000	826,000 <sup>b</sup>	1,487,000
	1930	432,000	2,592,000 <sup>b</sup>	5,832,000
Oats .....	1931	148,000	3,404,000	1,021,000
	1930	195,000	6,045,000	2,176,000

<sup>a</sup> Tons    <sup>b</sup> 100-lb. bags.

**MINERAL PRODUCTION.** Coal preserved its rank as the State's chief mineral product, despite a marked decline in output. There were mined, in 1930, 8,180,000 short tons of coal, as against 9,290,741 tons, by value \$26,254,000, in 1929. From coal were made, chiefly in by-product ovens, 458,443 short tons (1930) of coke, conspicuously less than the 721,457 tons of 1929. Second in rank, the State's production of the metals gold, silver, copper, lead and zinc also fell off in 1930, as the prices obtainable, except for the ores' gold content, discouraged activity. Gold production was 218,258 fine ounces (1930) and 220,285 (1929); in value, \$4,511,800 (1930) and \$4,553,700 (1929). That of silver, \$1,867,855 for 1930 as against \$2,363,642 for 1929, represented an actually greater quantity, 4,851,571 fine ounces, mined in 1930, than the 4,415,838 fine ounces of 1929, but the market price in 1930 averaged much lower. The smelter output of copper, likewise, was high, being 12,943,857 pounds for 1930 as against 10,519,784 for 1929; but the value of the product of 1930 was less than the \$1,567,293 of 1929. The production of zinc, for which the latest figures available were those of 1929, was 29,431 short tons, in value \$3,884,820. The production of lead, similarly for 1929, was 24,445 short tons, in value \$3,180,064. The quantity of petroleum produced, 1,657,000 barrels for 1930, was much below the 2,358,000 of 1929; the value of the petroleum was \$1,500,000 (estimated) for 1930 and \$2,380,000 for 1929. Clay products (1929) were \$3,117,064. The value of all mineral products was \$55,331,911 for 1929; for the year 1928, it was \$58,594,688.

The output of gold, silver, copper, lead, and zinc from Colorado ores and gravels in 1931 in terms of recovered and estimated recoverable metal was estimated at 230,574 ounces of gold, 2,074,591 ounces of silver, 13,457,000 pounds of lead, 7,722,000 pounds of copper, and 31,975,000 pounds of zinc, by the U. S. Bureau of Mines. These figures are to be compared with 218,470 ounces of gold, 4,290,587 ounces of silver, 45,535,000 pounds of lead, 9,787,000 pounds of copper, and 72,557,000 pounds of zinc in 1930. Compared with 1930 figures, gold shows an increase of \$250,192, silver a decrease of 2,215,996 ounces, lead a decrease of 32,078,000 pounds, copper a decrease of 2,065,000 pounds, and zinc a decrease of 40,582,000 pounds. The gross estimated value of the output of metals in Colorado in 1931 was gold \$4,766,388, silver \$601,631, lead \$511,366, copper \$640,926, zinc \$1,215,050, or a total of \$7,735,361, as compared with \$13,199,868 in 1930.

**MANUFACTURES.** Federal Census data obtained in 1930 and covering 1929 gave the number of the State's manufacturing establishments as 1645. These employed, in 1929, 32,735 wage earners, or 2.3 per cent more than were employed in the manufactures of the State in 1927. There were paid in 1929, \$43,249,074 in wages. Materials used in manufacture cost \$108,895,151. The fuel and purchased electricity used cost \$13,557,366. The manufactured product of the year was valued at \$304,654,661. The value added to goods or materials by the process of manufacture was reckoned at \$122,202,144. The value of the product of 1929 was some \$26,400,000 above that for 1927 and showed a much greater increase than did the cost of materials, fuel, and electricity. About half of the manufacturing activity was concentrated in Denver, where in 1929, 781 establishments employed 16,235 wage earners to whom were paid \$20,910,625 in wages, while the manufactured product totaled \$144,664,746.

**FINANCE.** State expenditures in the year ended June 30, 1930, as reported by the U. S. Department of Commerce, were: for maintaining and operating governmental departments, \$12,974,651 (of which \$799,896 was for local education); for interest on debt, \$438,547; for permanent improvements, \$5,465,787; total, \$18,878,985 (of which \$7,986,853 was for highways, \$3,278,767 being for maintenance and \$4,708,086 for construction). Revenues were \$20,497,808. Of these, property and special taxes furnished 34.4 per cent; departmental earnings and compensation to the State for officers' services, 10.9; sale of licenses, 39.8 (in which was included a gasoline sale tax that produced \$5,787,172). Funded debt outstanding on June 30, 1930, totaled \$9,018,086; of which \$6,750,000 was for highways. Net of sinking-fund assets, the debt was \$8,110,990. On an assessed valuation of \$1,586,462,903 the State collected in the year ad-valorem taxes of \$5,806,454.

**TRANSPORTATION.** The total number of miles of railroad line in operation on Jan. 1, 1931, was 4972.27. Additions to the mileage of line in the year preceding had totaled 6.69 miles and abandonments 1 mile. In 1931 the only additional building reported was that of 0.09 mile of first track.

**EDUCATION.** Efforts were under way in 1931 to bring about legislation that would give the local school systems greater State support, through a

plan to reorganize the financing of public education.

**POLITICAL AND OTHER EVENTS.** The effort to place the charges for the issue of \$8,750,000 of the supplemental bonds of the Moffatt Tunnel District on the leaseholder of the Tunnel, the Denver and Rio Grande Western Railroad, met with its final defeat on April 20. The U. S. Supreme Court declined to review the case, which the Tenth Circuit Court of Appeals had determined against the District. There remained litigation undertaken with the purpose to relieve the population of the District of the obligation of the bonds, on the ground that the issue was illegal. The U. S. District Court of Denver, in this litigation, held on June 26 that the issue was a valid charge upon the district. Land owners in the State felt aggrieved at the course of the Federal Land Bank in pressing debtors in the State for payments. They appealed to Governor Adams in August to demand that the Bank declare a moratorium. He acceded to the extent of asking that the Federal Government cause the Bank to cease making "exacting demands" on the debtors.

**OFFICERS.** Governor, William H. Adams; Lieutenant-Governor, Edwin C. Johnson; Secretary of State, Charles M. Armstrong; Treasurer, Joseph P. Jackson; Auditor, William D. MacGinnis; Attorney-General, Clarence L. Ireland; Superintendent of Public Instruction, Inez Johnson Lewis.

**JUDICIARY.** Supreme Court: Chief Justice, John T. Adams; Associate Justices, Haslett P. Burke, John Campbell, John H. Denison, Charles C. Butler, Julian H. Moore, Benjamin C. Hilliard.

**COLORADO, UNIVERSITY OF.** A coeducational, State institution of higher learning in Boulder, Colo., founded in 1876. The number of students enrolled for the autumn of 1931 was 3311; the summer session enrollment was 3842. There were 339 faculty members, exclusive of assistants. The total income for general maintenance from State tax fees, tuition, etc., was estimated at \$1,610,500, while \$515,000 was received for the operation of hospitals, including fees. The library contained 238,210 volumes, 18,000 pamphlets, and 3300 maps. President, George Norlin, Ph.D., LL.D.

**COLORADO METHODISTS.** See **METHODIST EPISCOPAL CHURCH, COLORED.**

**COLORUMS.** See **PHILIPPINES** under *History*.

**COLOSSEUM.** See **PHILOLOGY, CLASSICAL.**

**COLUMBIA UNIVERSITY.** A nonsectarian institution for the higher education of men and women in New York City, founded as King's College in 1754. At Morningside Heights, Broadway and 116th Street, are located: Columbia College (for undergraduate men); Barnard College (for undergraduate women); Teachers College, including the departments of education and practical arts; the professional schools of law, engineering, architecture, journalism, business, library service, and optometry; and the non-professional graduate faculties of political science, philosophy, and pure science. The College of Physicians and Surgeons and the School of Dental and Oral Surgery are on West 168th Street, the College of Pharmacy on West 68th Street, Seth Low Junior College in Brooklyn, N. Y., and St. Stephen's College at Annandale-

on-Hudson, N. Y. In addition, through university extension classes and the summer session, courses are offered for resident students at Morningside Heights; and other courses are offered at Camp Columbia, as well as at several extramural centres.

On the basis of the enrollment on Nov. 1, 1931, the total number of resident students for the year was estimated at 35,778, distributed as follows: Undergraduates, 3602, of whom 1810 were in Columbia College, 1046 in Barnard College, 333 in Seth Low Junior College, 127 in St. Stephen's College, and 286 in other schools; and graduate students, 3371. The distribution of professional students was as follows: Law, 566; medicine, 422; engineering, 258; architecture, 127; journalism, 164; business, 508; dental and oral surgery, 241; pharmacy, 564; optometry, 48; library service, 274; and Teachers College, 7094; 7053 students were enrolled in university classes and 274 were unclassified. Of the 10,900 non-resident students, 8000 were registered in home-study courses and 2900 in special and extramural courses. There were 14,016 students registered for the summer session of 1931. The grand total is exclusive of 2804 duplicate registrations.

The faculty and officers of administration in 1931 numbered 2853, of whom all but 48 were in active service. This number was distributed as follows: Professors, 340; associate professors, 145; assistant professors, 245; associates, 129; instructors, 413; lecturers, 88; assistants, 252; curators, 4; associates, instructors, lecturers, and assistants in Teachers College, 224; instructors and lecturers in the College of Pharmacy, 21; instructors in extension and home study, not included above, 607; instructors in summer session, not included above, 531; officers of administration, 63.

Among the professorial appointees for the year 1931-32 were: Carl W. Ackerman, dean of the school of journalism; W. Emerson Gentzler, secretary of appointments; Nicholas McD. McKnight, associate dean of Columbia College; Boris A. Bakmeteff, civil engineering; Eugene H. Byrne, history; Clarence O. Cheney, clinical psychiatry; Louis Cons, French literature and director of the *Maison Française*; Carter Goodrich, economics; Harold Hotelling, economics; Robert S. Lynd, sociology; Leo Wolman, economics; Erwin Brand, biological chemistry; William C. Casey, sociology; Frederick L. Fitzpatrick, natural sciences; Jan Schilt, astronomy; Ramon J. Sifre, hygiene and public health; Cecil C. Briggs, architecture; Henry L. Mason, mechanical engineering; Lewis R. Stone, dentistry; Daniel E. Ziskin, dentistry.

The visiting professors appointed for the year 1931-32 were: Brand Blanchard, Swarthmore College; Mario Casella, University of Florence; Arthur L. Corbin, Yale University; William Morris Davis, Harvard University; Alexander Stewart Ferguson, University of Aberdeen; George Alexander Johnston, International Labor Office, Geneva; Edgar Wallace Knight, University of North Carolina; Alfred L. Kroeber, University of California; Piero Misciatelli, University of Siena; Charles W. Pipkin, Louisiana State University; Charles E. Spearman, University of London; Karl Vietor, University of Giessen; Florian Znaniecki, University of Posen.

Important events of the year included the formal celebration in October of the fiftieth anniversary of the founding of the School of Political

Science, marked by the last public appearance of Prof. John W. Burgess (q.v.), whose vision and courage brought the school into existence; the generous gift from Edward B. Harkness to meet the cost of erecting a library building on Morningside Heights, designed to house ultimately 4,000,000 volumes and the school of library service; the formal incorporation into the university's educational system of the National Institute of Public Administration; the affiliation between the university and the New York Post-Graduate Medical School; and the selection of the university by the trustees of the estate of the late Edwin B. Parker of Washington, D. C., as the seat of a graduate school of international affairs. There was also established a Japanese culture centre, and provision was made for a Casa de las Espanas as the seat for the study of Spanish history, literature, and institutions. At the Medical Centre, Bard Hall, a residence for university officers and students, was completed, and at Teachers College there was to be established under the direction of the college a new institution for demonstration and experiment in the training of teachers. The Theodore Roosevelt Professorship of American History and Institutions, the work of which was inaugurated by Professor Burgess in 1906 and which was discontinued in 1914 on the outbreak of the World War, was re-established at the University of Berlin. Ceremonies were held at Christ Church, Stratford, Conn., on May 15, 1931, attendant on the formal presentation by the university of gates to the graveyard in which the bodies of Samuel Johnson, first president of King's College, and of his son, William Samuel Johnson, first president of Columbia College, are buried. There was also held in September a special university convocation in honor of the foreign guests of the American Bar Association and the members of the International Law Society, upon which occasion the degree of Doctor of Laws, *honoris causa*, was conferred upon ten of the distinguished visitors from Great Britain, Germany, and France. See BAR ASSOCIATION, AMERICAN.

During the year there were published the first volumes of the series of 18 which are to constitute the Columbia University edition of *The Works of John Milton*, the first complete edition ever made. There were also established under the editorship of Dr. Francis Carter Wood, director of the Institute of Cancer Research, the *American Journal of Cancer Research*, as a continuation of the journal of the American Association for Cancer Research and the American Society for the Control of Cancer, and under the editorship of Dr. Oliver S. Strong, of the department of neurology, a new *Bulletin of the Neurological Institute of New York*. The trustees adopted a new and improved method for the administration of athletic sports and intercollegiate athletic contests.

The capital endowment in 1931, excluding value of plant (including Barnard College, Teachers College, College of Pharmacy, and St. Stephen's College), was \$80,380,470; the estimated total resources as of June 30, 1931 (including Barnard College, Teachers College, and College of Pharmacy), were \$140,138,152; and the annual budget for 1931-32 (including Barnard College, Teachers College, College of Pharmacy, and St. Stephen's College) was \$17,577,519. During 1930-31 the university received gifts in money representing a total of \$4,139,980. The chief additions

to special endowments were the gift of \$1,300,000 from Edward S. Harkness toward the construction and equipment of Bard Hall; \$600,000 from Edward S. Harkness for the Edward S. Harkness endowment fund for the department of surgery; \$100,000 from the estate of Charles H. Ditson for the Charles H. Ditson endowment fund; \$75,000 from the estate of George W. Ellis for the George W. Ellis fund; \$69,813 from the estate of James Brander Matthews for the James Brander Matthews fund for the dramatic museum; \$53,000 from the estate of Ellen C. Harris for the Ellen C. Harris fund; \$50,000 from the estate of Madeleine L. Ottmann for the Madeleine L. Ottmann fund; and substantial gifts from many donors for various research projects. Gifts to income totaled \$1,168,054. The library contained 1,305,596 volumes. President, Nicholas Murray Butler, Ph.D., Hon.D., LL.D., Litt.D. To President Butler was awarded a Nobel Prize for Peace in 1931, the honor being shared with Jane Addams. See NOBEL PRIZES.

**COMETS.** See ASTRONOMY.

**COMMISSION PLAN.** See MUNICIPAL GOVERNMENT.

**COMMODITY PRICES.** See BUSINESS REVIEW; FINANCIAL REVIEW.

**COMMONWEALTH FUND.** See UNIVERSITIES AND COLLEGES.

**COMMUNISM.** The international Communist movement gained decided impetus during 1931, the most striking gains being registered in Germany and China. Intensification of the worldwide economic depression, financial crises in most countries of the world, increasing unemployment and want, and disturbed political conditions contributed to its growth. It was significant, however, that the growth was largely confined to areas in which political unrest originated in grievances not directly attributable to the economic depression. Thus Communist activity was most noticeable in countries or territories lacking a truly popular government and in which the laboring classes were suffering from a chronically inadequate standard of living. Conversely, in Western Europe (excluding Germany), the United States, the British dominions, and the most progressive of the Latin American states, the Communist gains were either nil or relatively unimportant.

**THE COMMUNIST INTERNATIONAL.** The eleventh session of the executive committee of the Third (Communist) International, held in Moscow in the spring of 1931, was attended by delegates from 49 countries, who reported a total contributing membership of 2,518,637 persons. The total excluded, of course, the numerous non-official Communist factions in various countries whose activities also were directed toward social revolution. A financial statement submitted for the preceding year showed receipts of \$1,090,000, of which \$641,000 was expended for propaganda purposes. William Z. Foster, leader of the official Communist group in the United States—the Workers' party of America—was one of the 30 delegates elected to the presidium of the Third International. The adjustment of the Third International's world policies to the exigencies of the Soviet Union's foreign relations was a striking feature of its development during the year. There was a marked let down in those exacerbations to foreign hostility against the Soviet Union which had marked the activities of the Red International in previous years. Observers pointed

out that the Soviet Union was vitally dependent upon foreign markets, foreign machinery, and technical experts for the completion of the Five-Year Plan and that Russian interests would be best served by harmonious relations with the great industrial nations (see UNION OF SOVIET SOCIALIST REPUBLICS under *History*).

On the eve of the 14th anniversary of the October (Bolshevist) revolution, the executive committee of the International issued an appeal to the "workers and oppressed people of all the capitalistic world" to support actively the "Chinese proletariat" in their struggle with Japan in Manchuria. For the development of the Chinese Communist movement during 1931, see CHINA under *History*.

**COMMUNISM IN THE UNITED STATES.** Public interest in the Communist movement in the United States during 1931 centred chiefly in: (1) The report of the Fish committee to the House of Representatives; (2) the intervention of Communist agitators in the Harlan County, Ky., labor disorders and the Scottsboro, Ala., case; and (3) the Communist-directed "hunger march" to Washington for the opening of Congress December 7.

The report of the Fish committee was submitted January 17 after eight months' investigation of Communist activities in all parts of the country. The majority offered 14 recommendations for anti-Communist legislation, with Representative John Edward Nelson of Maine dissenting. According to the report, there were in the United States 12,000 dues-paying members of the Communist party and between 500,000 and 600,000 active sympathizers, all working under the direction of the Third International in Moscow to overthrow the American political and economic systems and to overthrow established religions. Nevertheless, the report asserted that communism had made little headway in either the American Federation of Labor, the public schools, the colleges and universities, or among the Negro population, or the personnel of the army and navy. No proof had been uncovered of the authenticity of the so-called "Whalen documents" or of the alleged connection between the Amtorg Trading Corporation, business agent of the Soviet Government, and subversive activities in the United States (see 1930 YEAR BOOK). The Soviet Government was charged, however, with dumping lumber, pulpwood, manganese, and other products extracted by convict labor to disorganize the American market.

The committee's majority recommendations called for cancellation of the citizenship of members of the Communist party, deportation of all alien Communists, prevention of further naturalization of Communists, and the exclusion of Communist publications from the mails. Opposing these recommendations, Representative Nelson stated that they were not warranted by the facts. He urged that communism be combated by such social and industrial reorganization as would assure labor a full share in the economic life of the country.

The intervention of Communists in the coal strikes in Harlan County intensified the already bitter and violent struggle between miners and operators but won some converts through aid and food supplied to the strikers. The Scottsboro case, involving eight Negro youths sentenced to death for alleged assault upon two white women, offered an opportunity for propaganda among Negroes

that the International Labor Defense, a Communist organization, was not slow to seize. As a result of its activities the International Labor Defense was denounced by leaders of the National Association for the Advancement of Colored People, who charged that the Communists were more interested in promoting their propaganda than in saving the lives of the eight youths. See KENTUCKY and ALABAMA under *Political and Other Events*.

The "hunger march" on the national capital attracted nation-wide newspaper publicity, but resulted in little violence. Starting several weeks earlier from St. Louis, Chicago, Buffalo, Boston, and other points some 1200 men and women in 71 trucks and motor cars converged on Washington on December 6 demanding cash relief and Federal unemployment insurance. Met on the outskirts of the city by a police escort, they were fed and sheltered in the Salvation Army Headquarters and the Marine barracks overnight. Their request to present their demands directly to Congress and the President was rejected. The demonstrators marched peaceably past the Capitol, reiterated their demands at a mass meeting, and then left Washington (December 8) after a breakfast served by merchants and relief organizations. At many of the cities visited en route to the capital, the demonstrators were fed and housed; at others they were hustled through and forbidden to stop to hold meetings. Fourteen members of the vanguard were arrested November 27 for unlawfully parading before the White House and were sentenced to six months in jail or \$100 fine by a District of Columbia police court judge on December 1.

Communist agitation among the Negroes of Chicago stirred up a riot on August 3 in connection with the eviction of a Negro tenant. The police fired on a menacing crowd of 5000, killing three men and seriously wounding others. In New York and other American cities, meetings were held under Communist auspices August 1 as part of world-wide demonstrations for "the defense of the Soviet Union against imperialistic war." On September 19, the *New York Times* reported that an outlaw radio station in Manhattan, believed to have been operated by Soviet agents, had been communicating in code with Moscow for nearly a year.

**COMMUNISM IN OTHER COUNTRIES.** Communist activities increased noticeably in southeastern Europe, particularly in Austria, Hungary, Bulgaria, and Rumania. In the Bulgarian national elections during the year, the Communists registered important gains. Vienna police on November 4 reported the discovery of a large workshop for the forgery of passports and other governmental documents. It was asserted that the shop supplied Communist agitators with the documents required to undertake subversive activities in virtually every country in the world. The following day, the Bulgarian police announced the discovery of a system of Communist cells and the arrest of a special emissary of the Third International.

In Rumania a general round-up of Communists during the summer netted about 1000 prisoners, while the Greek cities of Athens and Saloniki were reported as fast becoming important centres of Communist propaganda. There were numerous arrests of alleged Soviet spies in southeastern Europe during the year, the most sensational of these being that of the Polish army officer, Maj. Piotr Demkowski, who was executed July 18. The

Communist-sponsored anti-war meetings, held throughout the world on August 1, resulted in a number of riots and clashes with the police in European cities. In the French local elections of October 18, however, the Communists made no impression upon the voters; nor did they in the British general election. There was some evidence of the growth of Communist influence in the Irish Free State during the year.

Orthodox communism played a much less important rôle in the Spanish revolution and its aftermath than had been generally anticipated. Spanish Communists affiliated with the Third International comprised an insignificant minority. The ultra-radical movement in Spain found its chief expression in the *Sindicato Único*, an independent syndicalist labor organization with a semi-communistic programme. See SPAIN.

The Canadian Government took active steps to suppress Communist organizations, arresting eight alleged "key men" in various cities. At their trial in Toronto early in November, Sergeant John Leonard of the Royal Canadian mounted police told from the witness stand of having posed as a Communist for seven years in order to keep in touch with the workings of their organization. Elected secretary of the Regina branch of the party, he sat in the inner circle of officers. He testified that the Third International supplied \$3000 to start the Canadian movement, but ended its subsidy when the party membership grew to 5000. As the party was illegal in Canada, seven of the accused received sentences of five and two years concurrently, and one a sentence of two and one years concurrently. In Australia, Communist agitators attempted to extend their activities from the large cities to the unemployed in the country districts of New South Wales and Victoria. In many instances, however, they were forcibly evicted from farming communities by organized local groups.

The vigorous repressive measures of a number of South American Governments during the year indicated considerable alarm at the spread of Communism and allied types of radicalism. Communist doctrines found a particularly fertile breeding ground among the illiterate and exploited Indians and mestizos of the Andean republics. The major Communist outbreak in Latin America occurred in Chile (q.v.), following the overthrow of President Ibañez, who for more than four years had maintained a close rein upon radical activities. In Peru, Bolivia, and Ecuador the economic depression and unstable political conditions encouraged Communist agitators, many of them foreigners, to expand their efforts among the poorer classes. Peru during 1931 deported many such agitators, while Bolivian officials chased Communists active in their country into the vast southeastern wilderness of the Chaco, where mere existence was difficult.

Communists were charged with raiding a number of Colombian towns and engaging in skirmishes with citizens and police. In Argentina, Brazil, and Venezuela the dictators continued to repress Communist agitators with a firm hand. In Uruguay, police and Communists clashed at Rocha during the anti-war demonstrations of August 1 and a large Communist demonstration in front of the Congressional Palace in Montevideo aroused fears of an uprising. It was important to remember, however, that in South America, as in many other regions, government officials frequently labeled all their political opponents as Com-

munists, regardless of their true political color, and treated them accordingly.

Communist agitation and resulting unrest continued among the native tribes in many regions of South Africa. The Belgian Government during the year took measures to prevent the spread of the movement in the Belgian Congo, where an attempt was made to establish headquarters for Communist activities. In India, Burma, and French Indo-China Communism was linked with the nationalist movements, as it had been earlier in China. On June 2, Minister of Colonies Paul Reynaud disclosed before the Colonies Commission of the French Chamber of Deputies details of a Communist plot for a general uprising in French Indo-China. He said that intensive Soviet propaganda had been widespread in Indo-China for some time, but that it had led to menacing developments only in northern Annam. During an uprising there on May 1, 175 rebels were killed in an attack upon a Government post, M. Reynaud said.

In June, 1931, British agents in Singapore arrested Joseph Ducroix, a French Communist, believed to have been the brains of the Communist movement in interior Provinces of China. In a notebook found in his office was listed the names of Communist agents scattered throughout the Far East. Ducroix was sentenced to 18 months' imprisonment and police in Hong Kong, Shanghai, and Hankow utilized the information obtained from him to make a general round-up of Communist agents in those cities. See *ECUADOR*, *JAPAN*, *ESTONIA*, *FINLAND*, and *CUBA* under *History*.

Communism in the Union of Soviet Socialist Republics, China, Germany, Chile, and most of the other countries mentioned in this article is discussed further in the separate articles on each country under *History*. For an able discussion of the Communist intervention in the Scottsboro, Ala., case, consult Walter White, "The Negro and the Communists," *Harper's Magazine*, December, 1931; consult also "Communism in China," *Foreign Affairs*, January, 1931.

**COMSTOCK, JOHN HENRY.** An American entomologist, died in Ithaca, N. Y., Mar. 20, 1931. He was born in Janesville, Wis., Feb. 24, 1849, and was graduated from Cornell University in 1874. After a year of graduate study at Yale University he became an instructor in entomology at Cornell, assistant professor in 1877, and professor in 1882. From 1879 to 1881 he was entomologist of the U. S. Department of Agriculture, and in 1891 became nonresident professor of entomology at Leland Stanford Junior University. His investigations dealt with the morphology, classification, and economic relations of insects, in which he was ably assisted by his wife, Anna Botsford Comstock. He retired as professor emeritus in 1914. His important publications include *Report on Coiton Insects* (1879); *Introduction to Entomology* (1888); *Evolution and Taxonomy* (1893); *A Manual for the Study of Insects* (with his wife, 1895); *The Wings of Insects* (with J. G. Needham, 1897); *Insect Life* (1901); *How to Know the Butterflies of the Eastern United States* (with his wife, 1904); and *The Spider Book* (1912).

**CONGO, BELGIAN.** A Belgian colony in Central Africa, formerly the Congo Free State, which was annexed to Belgium in 1908. Area, estimated at 918,000 square miles; the native (Pantu) population in 1930 was 9,584,936. On Jan. 1, 1930, the white population numbered 25,679, including 17,676 Belgians, 1008 English, 1582 Portuguese, 1490 Italians, 544 Americans, and 717 French. The chief city and former capital is Boma; by a royal decree of 1923, the capital was transferred to Leopoldville (population, 39,330). Other important towns are Elizabethville (25,595), Stanleyville, and Coquilhatville. The mission schools were attended by about 228,650 children in 1930.

Primitive agriculture is developing under Government supervision. Palm nuts, palm oil, white copal (resin), rubber, coffee, and cacao are the principal products. Cattle thrive in the highlands of Katanga, Ituri, and Kivu. The Katanga district is also one of the world's most important sources of copper, the production in 1930 reaching 146,700 tons. Gold, diamonds, radium, cobalt, coal, and tin also are mined and iron, platinum, palladium, vanadium, zinc, and bauxite are known to exist. Important helium supplies were discovered in 1930. Imports in 1930 were valued at 1,581,000,000 francs (1,943,000,000 francs in 1929) and exports at 1,512,000,000 francs (1,444,000,000 francs in 1929). One Belgian franc equals \$0.0278 U. S. Due to the fall in prices of colonial products, the 1930 budget showed a final deficit equivalent to \$2,000,000. Estimated revenues and expenses were 690,810,000 and 690,732,121 francs, respectively.

**COMMUNICATIONS.** Extension of the Benguela Railway from Luao, on the eastern frontier of Angola, to Tenke, 335 miles distant in the Katanga Province of the Belgian Congo, was completed on Mar. 1, 1931. The connection with the Katanga Railways at Tenke constituted the final link in the first trans-African railway line. The Katanga Railways connect in turn with the Rhodesian system (British) and with Cape Town, Durban, Delagoa Bay, Beira, and other ports on the Indian Ocean. The Benguela line extends from Lobito Bay on the west coast, and provides the Katanga mining district with a shorter outlet to world markets. In 1931, railways in the Belgian Congo extended 2500 miles, highways 16,746 miles, telegraph lines 3538 miles, telephone lines 3360 miles. Steamers provide means of transport along the navigable stretches of the Congo and its branches. The chief administrative centres are connected by air lines.

**GOVERNMENT.** A governor-general and several vice governor-generals administer the colony on behalf of the Belgian King and the budget is voted by the lower house of the Belgian Parliament. The colony is divided into four Provinces which are in turn divided into 22 administrative districts. There is a military force of 14,300 natives officered by 431 Europeans and a territorial police of 5800 men. Governor-General in 1931, Lieut.-Gen. Tilkens, appointed in 1927.

**RUANDA-URUNDI.** The districts of Ruanda and Urundi, formerly in German East Africa, were turned over to Belgium as mandatory of the League of Nations and in 1925 were united ad-

ministratively with the Belgian Congo; the capital is Usumbura.

**HISTORY.** Demands for a degree of autonomy were presented in 1931 in the form of a memorandum to the Belgian Colonial Secretary by the Association of Belgian Colonists in Katanga. The association urged among other things the creation of a provincial parliament for Katanga, to be elected by vote of Belgian colonists. Although the colonists pay heavy taxes, they are deprived of all civic rights, according to the memorandum, which was published in Belgian newspapers of May 11, 1931. The Government in the same year inaugurated measures to prevent the spread of Communism among the natives, the *London Times Weekly* of May 14, 1931, reported. General Pilkens, Governor-General of the Belgian Congo, was recalled to Brussels in 1931 to confer upon emergency measures required to relieve the serious economic crisis in the colony. See **BELGIUM**.

**CONGREGATIONAL AND CHRISTIAN CHURCHES, THE GENERAL COUNCIL OF THE.** The General Council of the Congregational and Christian Churches was instituted at Seattle, Wash., June 26, 1931, when the National Council of the Congregational Churches in the United States and the General Convention of the Christian Church merged their activities in this new organization. The formal existence of the former organizations, however, was continued for the time being against possible legal necessities.

Congregationalism was founded in the United States by the Pilgrims in Plymouth, Mass., in 1620 under the leadership of Brewster, Bradford, and Winslow. The origin of this movement lay in the Separatist activity in England. The Puritans of Massachusetts Bay followed a similar tendency and, as a result, the essential elements of Separatism and Puritanism were combined in Congregationalism. In this denomination each church holds the right to frame its own statement of belief, and the policy of the denomination, as a whole, represents adaptation to conditions rather than accord with a theory of church government.

The Christian Church originated in three religious movements: that of the Rev. James O'Kelly of Virginia, who in 1792 withdrew from the Methodist Episcopal Church; that of Abner Jones, who withdrawing from the Baptist denomination organized a separate church in Lyndon, Vt., in 1801; and that of a group of Kentucky Presbyterian ministers who formed a new denomination in 1804. These groups eventually united, all holding that minor differences in opinion should be subordinated to Christian brotherhood.

The general council, by which the administrative affairs of the churches are carried on, has no ecclesiastical authority, but includes delegates, both ministerial and lay, elected by the State conferences, district associations, and similar bodies for purposes of fellowship, advice, and coöperative endeavor. It meets biennially, the session in 1931 being held in Seattle, Wash., June 25-July 3. The principal feature of this meeting was the institution of the council by the adoption of constitution and by-laws, based upon the plan of union adopted in 1929 by the National Council of the Congregational Churches

and the General Convention of the Christian Church.

The plan of union provides for representation in the general council by appointment of State and local bodies, whether Congregational, Christian, or Congregational and Christian in their makeup. This makes it possible for a State or district body, consisting entirely of Congregational churches or entirely of Christian churches, to have representation in the national body on the same terms with such associations or conferences as may have merged former Congregational and Christian bodies. In other words, it follows the democratic principle of leaving to the local constituency the form of its own organization. Provision is also made for the common administration of benevolent activities, including home and foreign missions, religious education, and the like. Both bodies throughout their histories have been democratic in organization, and the plan of union provides for full local autonomy in the individual church and in groups of churches associated together. The next meeting of the general council was to be held in Cleveland, Ohio, in the spring or early summer of 1933.

Statistics for the Congregational churches as of Jan. 1, 1931, showed 5381 churches, 5609 ministers, and a church membership of 943,509. There were 3095 young people's societies, with a membership of 159,025. The Sunday school enrollment was 709,639. The total raised for all benevolences was \$4,052,135, and the home expenses of the churches \$20,186,066.

Statistics for the Christian churches as of Jan. 1, 1931, showed 1132 churches, 971 ministers, and a church membership of 108,188. There were 299 young people's societies, with a membership of 8372. The Sunday school enrollment was 79,120. The total raised for all benevolences was \$138,025, and the home expenses of the churches \$1,049,434.

The American Board of Commissioners for Foreign Missions is the oldest foreign missionary society in America, having been organized June 29, 1810. On Jan. 1, 1931, there were 17 missions under 12 different flags; the stations connected with these missions numbered 94 and the out-stations 1655. The missionaries holding life appointments numbered 649 and included 148 ordained men, 76 unordained men, 214 wives, and 210 single women. There were also 52 associates serving for shorter periods, bringing the total number of missionaries up to 701, while native workers numbered 5281. Religious services were conducted in 2688 places. The organized churches numbered 695, with 105,442 communicants. The total church constituency numbered 288,458; Sunday schools, 1340; theological seminaries and training schools, 27, with an attendance of 1634 students; colleges, 10, with 4914 students; secondary schools, 72, and primary and elementary schools, 1236, with a total enrollment of 91,221. There were 30 hospitals and 52 dispensaries, with a staff of 47 physicians and 32 foreign nurses. Total expenditures of the board for the year ending Aug. 31, 1930, were \$2,151,766.

The field of the American Missionary Association included Negroes, Indians, and mountaineers in the South and Southwest; Orientals and Indians in the West; Porto Ricans, and Mexicans. Statistics of the association showed that in 1929-30 there were 232 churches with 9773

members and 24 schools with an enrollment of 1575 pupils. Expenditures during the same period amounted to \$1,103,520. The Congregational Home Missionary Society with its affiliate, the Congregational Sunday School Extension Society, organizes schools and churches and assists in the commissioning and support of pastors in four-fifths of the territory of the United States. In the remainder of the country similar work is done by independent State conferences. In 1930 these societies helped to maintain 614 churches and preaching stations, having a total membership of 30,617, and received 2848 persons into church membership; 471 home missionaries, including student summer workers, were enrolled. Expenditures amounted to \$495,644, and total receipts to \$495,176.

The Annuity Fund for Congregational Ministers was reported to have assets totaling more than \$10,000,000; the membership was 2612; and annuity payments amounted in 1930 to \$226,750. The Congregational Church Building Society received \$529,464 in 1930 for current use and voted 146 church grants and loans and 20 parsonage loans amounting to \$413,380. Among the theological seminaries with which the Congregational denomination was affiliated were: The Chicago Theological Seminary; Divinity School of Yale University; Hartford Seminary; Oberlin Graduate School of Theology; Atlanta Theological Seminary Foundation; Union Theological College (Chicago); and Pacific School of Religion. In addition there were 41 colleges which have had some historical relation to Congregationalism, although a number of them are now undenominational. The Christian denomination had affiliation with Elon and Defiance Colleges.

The accompanying table, reprinted from the *Congregational Year Book* for 1930, gives statistics of international Congregationalism:

## INTERNATIONAL CONGREGATIONALISM

Countries	Churches, Chapels, and Stations	Members of Churches	Members of Sunday Schools
Africa <sup>a</sup> .....	1,569	57,510	35,353
Australia and New Zealand .....	525	22,661	32,713

<sup>a</sup> Includes reports of London Missionary Society and American Board.

<sup>b</sup> Repeated from last Year Book.

<sup>c</sup> United Church. Comprises the former Presbyterian, Methodist, and Congregational churches.

<sup>d</sup> Includes United Church of Canada as noted above.

The headquarters of the General Council of the Congregational and Christian Churches are at 287 Fourth Avenue, New York City, with a regional office in the Christian Publishing Association Building in Dayton, Ohio. The Congregational Publishing Society maintains branches at 14 Beacon Street, Boston, and at 418 South Market Street, Chicago. The officers of the general council for 1931-1933 are: The Moderators, the Rev. Carl S. Patton, Los Angeles, Calif., and the Rev. Frank G. Coffin, Columbus, Ohio; secretary, the Rev. Charles E. Burton, New York City; associate secretary, the Rev. Frederick L. Fagley, New York City; assistant secretary, the Rev. Warren H. Denison, Dayton, Ohio; treasurer, William T. Boulton, New York City.

CONGRESS, UNITED STATES. See UNITED STATES.

CONNECTICUT. POPULATION. According to the Fifteenth Census, the population of the State on Apr. 1, 1931, was 1,606,903; in 1920, it was 1,380,631. According to origin, the population in 1930 was composed of 1,193,802 native whites, 382,871 foreign-born whites, 29,354 Negroes and 876 of other colored races. As to sex the population of 1930 was marked by the predominance of females, numbering 805,600, over males, who numbered 801,303. As to occupations, 677,292 persons reported in 1930 as gainful workers in all industries were divided chiefly into the following groups: manufacturing and mechanical industries, 336,386 (this group consisted chiefly of those engaged in manufacture, but included also 48,132 in the building industries); trade, 112,623; professional service, 50,239; domestic and personal service, 61,845; transportation, 48,150; agriculture, 36,687.

The cities having the largest populations were:

	1930	1920
Hartford, the capital .....	164,072	138,030
New Haven .....	162,655	162,537
Bridgeport .....	146,716	143,555
Waterbury .....	99,902	91,715
New Britain .....	68,128	59,316

AGRICULTURE. The following table shows the acreage, production and value of the principal crops in 1931 and 1930:

Crop	Year	Acreage	Prod Bu.	Value
Hay, tame ...	1931	250,000	323,000 <sup>a</sup>	\$ 5,491,000
	1930	259,000	340,000 <sup>a</sup>	6,888,000
Tobacco ....	1931	22,500	29,295,000 <sup>b</sup>	7,763,000
	1930	23,400	32,409,000 <sup>b</sup>	12,024,000
Corn .....	1931	51,000	2,142,000	1,499,000
	1930	51,000	2,142,000	2,249,000
Potatoes ....	1931	12,000	1,920,000	1,248,000
	1930	11,000	1,925,000	2,214,000
Apples .....	1931	.....	675,000	742,000
	1930	.....	1,615,000	1,454,000

<sup>a</sup> Tons. <sup>b</sup> Pounds.

MINERAL PRODUCTION. The mineral output showed diminution for 1929, chiefly because of smaller production of clay products and of stone. The clay products of 1929 attained a value of \$2,038,530; those of 1928, \$2,558,384. Stone produced in 1929 amounted to 2,621,260 short tons (sandstone excluded); in 1928, to 2,852,980 tons (sandstone included). In value these totals represented \$3,496,520 (1929) and \$3,743,572 (1928). The production of lime attained \$386,855 for 1929, but was reduced to \$215,000 for 1930. The total value of the mineral production of the State was \$7,053,408 for 1929; for 1928, \$7,599,655.

**MANUFACTURES.** Federal Census data gathered in 1930 and covering 1929 gave the number of the State's manufacturing establishments as 3121. These employed 253,468 wage earners or 5.3 per cent more than in 1927. The wages paid them in 1929 totaled \$339,653,944, and were about 11 per cent above the wage total of 1927. Materials used in manufacture in 1929 cost \$634,738,824, while fuel and purchased electricity cost \$35,363,508; these non-labor costs exceeded by some 12 per cent the like total for 1927. The manufactured product of 1929 was valued at \$1,495,635,453, or some 16 per cent more than the total for 1927. Value added by manufacture in 1929 was estimated at \$825,530,121. New Haven led the manufacturing centres in point of the number of wage earners, 27,141, and the total of wages paid, \$42,899,091; the value of its product was \$135,894,115. Three other cities, though inferior as to number of wage earners or totals of wages paid, surpassed New Haven in the value of their product of 1929; they were: Bridgeport, with 30,577 wage earners, wage payments of \$39,309,730 and product of \$176,258,794; Hartford, with 24,744 wage earners, wage payments of \$36,023,307 and a product of \$157,241,974; Waterbury, with 24,396 wage earners, wage payments of \$32,093,421 and a product of \$157,587,994.

**FINANCE.** State expenditures in the year ended June 30, 1930, as reported by the U. S. Department of Commerce, were, for maintenance and operation of governmental departments, \$20,704,769 (of which \$1,577,106 was for local education); for interest on debt, \$656,865; for permanent improvements, \$13,300,663; total, \$34,675,862 (of which \$12,665,743 was for highways, \$2,778,433 being for maintenance and \$8,887,310 for construction). Revenues were \$38,920,756. Of these, property and special taxes formed 26.6 per cent; departmental earnings and remuneration to the State for its officers' services, 6.6; sales of licenses, 55.5 (including taxes of \$4,337,551 on sales of gasoline). The States' funded debt outstanding on June 30, 1930, was \$16,291,000. Net of sinking-fund assets, it was \$1,241,525. On property bearing an assessed valuation of \$3,009,930.177 were levied in the year State taxes of \$1,678,263.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1931, was 968.67. No important change in this total had taken place during the year preceding. No building of new line or trackage was reported in 1931.

**EDUCATION.** The Legislature of 1931 codified the State's school laws. According to State Superintendent Butterfield, a move was made, by legislation, toward equalizing high-school and trade-school opportunities and toward establishing more effective school supervision.

**LEGISLATION.** The regular session of the Legislature, ending on May 27, made for the ensuing two-year period appropriations totaling \$65,313,582, the largest amount that had been appropriated by any session in the State. A rural demand for better secondary highways was met by the provision of \$6,000,000 for the improvement of the earth roads. The sum of \$1,582,290 was appropriated for the construction of additional hospital accommodation for the State's tubercular patients. The State Senate defeated the Meaney bill for the repeal of the State Prohibition enforcement measure. Both branches,

however, later passed a bill calling for a popular referendum, to be held in November of 1933, on the proposal to petition Congress to submit to the several States an Article XX of the Federal Constitutional amendments repealing Article XVIII and restoring to the States the power to regulate or prohibit intoxicating liquors, except with regard to interstate commerce.

Governor Cross, a Democrat, made numerous recommendations to the Republican Legislature, but in the main it did not act on them. It on the contrary removed from the Governor the power, vested in that officer for 30 years, to nominate judges of the Court of Common Pleas. The Governor's programme for strengthening the Public Utilities Commission was killed, his nominee to the commission was rejected, and the law requiring the New York, New Haven & Hartford Railroad system to eliminate one grade crossing a year was repealed.

The 12 per cent tax penalty was reduced to 9 per cent. A proposal for a constitutional amendment providing for absentee voting was passed. It was rendered a crime to throw away a lighted cigarette in such a way as to start a fire. Amateur sports under permit of municipal or park authorities were rendered lawful on Sundays. Provision was made for a water supply for Hartford, to be obtained from the east branch of the Farmington River by a dam flooding the site of the town of Hartland. The statute enabling 100 citizens to require precedings by the attorney general to oust the Public Utilities Commission, which had figured in the political proceedings of the year before, was repealed over the Governor's veto. Provision was made for abolishing the Borough of Greenwich and consolidating it with the Town of Greenwich.

**POLITICAL AND OTHER EVENTS.** Artificial silk mills in Putnam went through an extensive strike of employees in July. Although the State law forbidding public clocks to show daylight-saving time remained in force, Hartford and some other cities again made the general change to summer time (an hour ahead of Eastern Standard) for business, church, and private reckoning. The High Rock tract, of some 2000 acres, near Beacon Falls, was presented to the State as a park by the Whittemore family of Naugatuck. In the municipal elections of November 3 Democratic mayors were elected by exceptional majorities in New Haven, Hartford, and Bridgeport. In the latter city the Socialist candidate for mayor outran the Republican by about 5 to 3 and made second place.

**OFFICERS.** Governor, Wilbur L. Cross; Lieutenant Governor, Samuel R. Spencer; Secretary of State, William L. Higgins; Treasurer, Roy C. Wilcox; Comptroller, F. M. Salmon; Attorney-General, Warren B. Burrows.

**JUDICIARY.** Supreme Court of Errors: Chief Justice, W. M. Maltbie; Associate Judges, F. D. Haines, G. E. Hinman, John W. Banks, Christopher L. Avery.

**CONNECTICUT COLLEGE.** A liberal college of arts and sciences for the higher education of women in New London, Conn., chartered in 1911 by the State of Connecticut. The enrollment for the autumn of 1931 was 569. The faculty numbered 64 members. The productive funds amounted to \$1,343,125, and the budget for the year, not including building operations, was more than \$575,568. There were 45,000 volumes in the library. In 1931 the college received ap-

proximately \$105,000 from Mr. and Mrs. George S. Palmer for wings to the library, and also \$16,600 in miscellaneous smaller gifts. President, Katherine Blunt, Ph.D.

**CONSERVATION.** See **FORESTRY**.

**CONSTRUCTION.** See **BUILDINGS**; **ARCHITECTURE**.

**CONSUMERS' SOCIETIES.** See **COÖPERATION**.

**CONTRACT BRIDGE.** It was in 1931 that Contract Bridge really advanced out of the evening entertainment class into a position of national prominence. The card game, developed slowly from the whist and auction of other days, grew into a mammoth business, the leaders of which took their places alongside important men in other professions. For with the amazing growth of the game that had taken the United States and Europe by storm, came the inevitable experts with their different, highly publicized systems, their own methods of getting the same results. The difference in the systems brought about discussions concerning the respective merits of the systems and their advocates. At the end of the year there were three recognized systems in vogue—among the experts and among the thousands who read avidly the daily journalistic contributions of these experts who had discovered a gold mine in contract bridge.

The three systems were: (1) The approach-forcing system, sponsored by Ely Culbertson, the brilliant young cosmopolite, which was originally devised by players at the Cavendish Club, New York City. The basic tenet of this Culbertson system, as it is widely known, is that a bid of two, denotes unusual strength and that a game should be made from the cards of the declarer. (2) The "official" system, sponsored by Sidney Lenz, and said to have been devised by a committee of experts. The only appreciable difference between this system and Culbertson's was that the bid of three here means what the bid of two means in the Culbertson method. (3) The one-over-one system, sponsored by George Reith and devised by players at the Knickerbocker Whist Club, New York City. This system contends fundamentally that a response is guaranteed to the partner's bid. The consistent publicity accorded the systems brought about new books as well as many revised editions on the subject so that at the end of the year the book markets were flooded with bridge books, and Culbertson's *Blue Book of Bridge* had taken a tenacious hold on the best seller's list, and Lenz's *Official System of Bidding* was also being sold in huge quantities. More discussion, with the attendant and more or less stimulated publicity, created the demand for a test of the systems of Culbertson and Lenz. The match was arranged, to be of 150 rubbers played over six weeks in New York City, with Culbertson wagering \$5000 against Lenz's \$1000, the entire sum to go to charity, and at the end of the year, after 125 rubbers, Culbertson and his partner,—his wife—Mrs. Josephine Culbertson, were leading, through the use of their approach-forcing system, by a margin of 15,000 points over Lenz and his partner, Oswald Jacoby, using the "official" system.

Other experts who professed one or the other of the different systems and who were considered as good if not better bridge players than either the highly publicized authors—Culbertson and Lenz—were Hal Sims, Jacoby, John Matheys, David Bernstine, Gratz Scott, Edwin Wetziar,

Willard Karn, Sherman Stearns, and George Reith. Sims, Jacoby, Bernstine, and Karn composed the Four Horsemen team which won both the Eastern and National championships in 1931. The only defeat suffered by this quartet was at the hands of the Knickerbocker team in the Vanderbilt Cup play.

Early in the year Mr. and Mrs. Culbertson toured Europe meeting all comers, and in the course of quite a long trip to all the large cities in the continent, only one match was lost—to an Austrian team. The English team, led by Colonel Buller, was defeated at London, but nevertheless numerous challenges for an international match with the British were received by the Culbertsons throughout the remainder of the year.

**COOKE, RICHARD JOSEPH.** An American clergyman, died in Athens, Tenn., Dec. 25, 1931. He was born in New York City, Jan. 31, 1853. Entering the ministry of the Methodist Episcopal Church in 1873, he was ordained in 1876. He later attended the East Tennessee Wesleyan University, from which he was graduated in 1880. From 1889 to 1912 he was professor of New Testament exegesis and historical theology at Chattanooga University. He was also vice chancellor in 1893 and acting president in 1897. He exerted a great influence in the Methodist church as editor of the *Methodist Advocate Journal* from 1891 to 1912 and as book editor of the church from 1904 to 1912. Elected bishop in the latter year, he was resident bishop in Portland, Ore., until 1916 and in Helena, Mont., until 1920 when he retired. During this period he was a member of the commissions on unification of the Methodist Episcopal Church and the Methodist Episcopal Church, South, and the Federation of Episcopal Methodism. His works include: *Doctrine of the Resurrection* (1884); *Reasons for Church Creed* (1888); *Christianity and Childhood* (1891); *The Historic Episcopate* (1896); *Christ and the Critics* (1898); *The Incarnation and Recent Criticism* (1907); *The Wingless Hour* (1911); *Freedom of Thought in Religious Teaching* (1913); and *Religion in Russia under the Soviets* (1924).

**COOKE, WALTER PLATT.** An American lawyer and financier, died Aug. 4, 1931, in Buffalo, N. Y., where he was born Apr. 28, 1869. On completing the law course at Cornell University in 1891 he established himself in Buffalo, where at the time of his death he was senior member of the firm of Kenefick, Cooke, Mitchell and Bass and chairman or director of numerous financial and industrial organizations. During 1920-22 he was acting Chancellor of the University of Buffalo, and was also chairman of the Council, the governing body of that institution. In 1925, by joint agreement between the German government and the Reparation Commission, he was appointed president, at The Hague, of the Arbitral Tribunal of Interpretation, which decided all controversies arising out of operation of the Dawes Plan. He resigned from this office in April, 1926, to become United States citizen member of the Reparation Commission, serving in this capacity for a year and a half and residing in Paris. In 1930, on invitation of various governments, he became a member of the London Arbitration Board, set up under the Young Plan to deal with various matters pertaining to reparations; he also was elected its president but never assembled a meeting. He was made an officer of the French Legion of

Honor, of the Order of Leopold (Belgium), and of the Order of Saints Maurice and Lazare (Italy). In 1926 he received the Chancellor's Gold Medal, awarded by the University of Buffalo for distinguished civic service.

**COÖPERATION. INTERNATIONAL COÖPERATIVE ALLIANCE.** This organization, at the beginning of 1931, had members in 41 countries, with a total of 229,890 societies and 70,000,000 persons belonging to them. These societies did a combined annual business in 1930 amounting to more than \$17,610,000,000; had a share capital of \$960,000,000, and reserve funds of \$548,600,000. The largest single group in the Alliance was the Russian coöperative movement with an annual business of \$14,938,000,000, share capital of \$310,800,000, and reserve funds of \$362,000,000. The membership of 229,890 societies belonging to the Alliance was divided up as follows: In the consumers' societies there were 48,233,000 members; in productive societies there were 136,200 members; in agricultural societies there were 22,403,000 persons. In addition, the Alliance regarded as affiliates 32,300 credit societies with a total membership of 14,985,000 persons.

**BRITISH COÖPERATIVE WHOLESALE SOCIETY.** In 1929, this organization was employing 248,736 persons or nearly 45,000 more than in 1925. Of the total number of people on its payroll, the British Coöperative Wholesale Society was employing 34,000 workers in its production de-

GERMANY. In 1930, in Germany, there were 52,853 coöperative societies as compared with 34,579 such societies in 1914. Of the 52,853 such organizations in 1930, 21,900 were credit societies. The accompanying table shows the membership and sales of German consumers' societies and the German Coöperative Wholesale Society in 1930.

## MEMBERSHIP AND SALES OF GERMAN CONSUMERS' SOCIETIES AND COÖPERATIVE WHOLESALE SOCIETY, 1930

partment. This well known coöperative organization carries on manufacturing activities in a large number of businesses, the value of the output of its productive and service departments reaching the sum of \$150,000,000 in 1929. Among the more important productive activities of the Society at the end of 1929 were the following: flour mills, employing 1625 workers; cracker and confectionery factories, employing 1331 workers; a margarine factory, employing 1059 workers; preserve factories, employing 1867 workers; drugs and chemical factories, employing 1263 workers; a hosiery mill, employing 1006 workers; clothing factories, employing 5609 workers; boot and shoe factories, employing 4056 workers; furniture factories, employing 1345 workers; soap factories, employing 1823 workers; printing and bookbinding plants, employing 2419 workers; building and engineering plants, employing 2332 workers.

The accompanying table shows the status of the coöperative societies in Great Britain in 1928 and 1929, by types of societies. It is apparent that despite unemployment and depression, the British coöperative movement showed real progress in 1929 as compared with the earlier year.

RUSSIA. In 1931, the total membership of the Russian consumers' coöperative societies was 56,000,000 persons. Of the whole group, women made up 26 per cent as compared with 14.4 per cent in 1928. A Russian authority noted the increasing rôle being played by women in the administration of these societies. In the towns, in 1929-30, women made up 31 per cent of the membership of directing boards and 26 per cent of the membership of auditing committees; in the rural communities the proportions were 19 per cent and 16.7 per cent respectively. Many of the women were engaged in social service activities on a coöperative basis. Thus, in one region women organized 128 crèches, coöperatively operated. In another area, the original coöperative union organized eight medical clinics for women, 300 child-caring institutions and 125 dressmaking classes.

According to a census taken by the State Planning Commission, 60 per cent of the 7,481,700 industrial workers were employed in small-scale industries. About 25 per cent of the workers in these small industries belong to coöperative societies, known legally as "kustar" industries. These "kustar" societies take the following forms: workers' productive societies work-

ing on a common-work job; societies for the purchase of materials and marketing of product; credit societies; and societies partly artisan and partly agricultural in character. On Oct. 1, 1930, there were in the Soviet Union 18,363 "kustar" societies having 2,000,000 members, of whom 46 per cent belonged to groups working coöperative factories or workshops. See UNION OF SOVIET SOCIALIST REPUBLICS under *Production*.

ITALY. Previous YEAR BOOKS have commented on the strength of the workers' productive societies in this country. These societies are formed mainly among the navvies and laborers in the building trades and take contracts for public works, such as the construction and maintenance of roads, bridges, and canals, and drainage, reclamation, and irrigation projects. The law permits such groups to combine and to assume contracts subject to the value of 5,000,000 lire (\$263,000). At the end of the year 1929 there were in Italy 1300 such coöperative labor societies with a combined membership of 105,453. Some of these groups have within single years carried out sizable projects. Thus, the Union of the Province of Modena, formed in 1915 and including 40 such societies, in 1929 fulfilled contracts totaling \$705,000 and in 1930 was engaged on contracts valued at more than \$1,000,000. In 1927, these societies carried out construction work to the value of \$9,577,000, reclamation to the value of \$2,391,000, and road maintenance work to the value of \$595,000.

PALESTINE. It is interesting to observe that the coöperative movement in Palestine is entirely Jewish, only one Arab society having been formed and this ending in failure. At the end of May, 1930, there were 249 Jewish coöperative societies registered of which 173 were actually in operation. Of the latter, 39 were agricultural societies, 52 were credit societies, 27 were industrial productive organizations, 34 were land and construction societies, 7 were societies of various other types and 14 were coöperative communities. Detailed information was obtained for 134 organizations which reported a membership of 33,436 persons, a working capital of \$1,630,000 and members' deposits amounting to \$3,462,000. The agricultural societies included a variety of types and through them the farmers were finding it possible to make purchases, sell their produce, insure their cattle and receive agricultural credits. The "Pardess" society of orange growers during 1930 handled 40 per cent of the total crop grown by the Jewish farmers. Among its other activities this society was operating a packing house with a capacity of 60,000 cases. Another society made up of the grape growers of the country was manufacturing and selling 90 per cent of the wine produced in Palestine. The Jewish Federation of Labor was giving particular attention to the promotion of workers' productive societies. At the end of May, 1930, there were 40 such groups but their total membership was only 507. These societies, in addition to employing their own members, carried on their payrolls 235 hired workers and apprentices.

PERU. In 1930, there was enacted a law making compulsory the organization of farmers into agricultural societies. The law's objective was "to make use of these legally recognized agricultural organizations for guiding the farming class toward higher voluntary forms of coöperative marketing, amalgamation of farm undertakings, and joint contract, the rise and de-

velopment of all of which would otherwise without this basis of legal recognition, be much delayed." The purposes of the societies were: to further advance methods of cultivation and irrigation; the organization of agricultural co-operatives including marketing, purchasing of farm machinery and supplies; the safeguarding of members' lives; and the supervision of the performance of their duties; assignment of a legal representative to speak for them in all dealings with the government on all questions relating to agriculture.

COPLAND PLAN. See AUSTRALIA under *Finance and History*.

COPPER. The world production of copper in 1931 was estimated at 1,460,000 short tons, of which the United States supplied 470,000 tons; Chile and Peru, 285,000; Africa, 180,000 tons, and Canada, 150,000 tons. There were reduced amounts for all of the countries of the world with the possible exception of Russia and Japan, the total comparing with 1,740,972 tons in 1930 and 2,127,104 tons in 1929, the latter year production being the greatest on record. The 1931 production was the smallest since 1923 when 1,280,940 tons were produced.

In fact the preliminary statistics of copper output, stocks, and other trade factors in 1931 indicated continuation of the depressed conditions of the copper industry, according to the U. S. Bureau of Mines. Smelter output from domestic ores declined about 25 per cent in 1931 following a drop of 30 per cent in 1930. Refinery output from foreign and domestic ores in 1931 was 30 per cent below 1930. Imports of unmanufactured copper dropped 31 per cent following a decline of 16 per cent in 1930, and exports of metallic copper were 24 per cent less in 1931 than in 1930. The extent to which production was curtailed was not sufficient to offset the greatly reduced demand for copper. As a result, reports indicate that stocks of refined copper rose to a record figure at the end of 1931. Stocks of blister showed a considerable decline from 1930, but total stocks of blister and refined copper were about 8 per cent higher than the previous record reserves at the end of 1920. Withdrawals of copper on domestic account, as estimated below, showed a drop of 28 per cent in 1931 following a decline of 29 per cent in 1930, and were approximately the same as stocks of refined copper at the end of the year.

The average monthly quoted price of copper (electrolytic, New York refinery equivalent) was 9.91 cents a pound in January, advanced to a high for the year of 10.02 cents in March, and then began a decline that continued through November. An advance in price in the latter part of December permitted the average for that month—6.68 cents—to barely exceed the low price recorded for November—6.67 cents.

In view of the lowest price on record prevailing in 1931 it is of interest to follow the general trend of copper for some years. The annual average in 1897 was 11.29 cents from which by 1899 the price had risen to 16.67 cents. There was a decline for several years followed by a rise, so that in 1907 an average of 20.004 cents was attained. Again there was a reaction broken by one increase in 1912, with a decline in 1914, the year of the War. From that point copper ap-

preciated until in December, 1916, a maximum of 31.89 cents was attained, a price never realized subsequently, although in 1929, copper did reach, in March, 21.257 cents. From this point in 1929 and 1930 the decline was rapid and the values during 1931 were as stated, with a minimum of 6.025 cents in the last week of November.

The smelter production of copper from domestic ores in 1931, as estimated by the Bureau of Mines, was 1,049,000,000 pounds, compared with 1,394,000,000 pounds in 1930. The 1931 production was 25 per cent lower than that of 1930, and was the smallest production recorded since 1922. The production of new refined copper from domestic sources, determined in the same manner as smelter production, was about 1,046,000,000 compared with 1,391,000,000 pounds in 1930. The output of new refined copper from domestic and foreign sources in 1931 amounted to about 1,504,000,000 pounds, compared with 2,157,000,000 pounds in 1930—a decrease of 653,000,000 pounds or 30 per cent. The production of secondary copper by primary refineries dropped from 280,500,000 pounds in 1930 to about 135,000,000 pounds in 1931. Thus the total primary and secondary output of copper by the refineries in 1931 was 33 per cent below the preceding year—a production of about 1,639,000,000 pounds being reported for 1931 as compared with 2,437,500,000 pounds in 1930.

The imports of unmanufactured copper into the United States during the calendar year 1931, amounted to 585,892,098 pounds or a monthly rate of 49,000,000 pounds. This compared with total imports of 817,154,236 pounds for the year 1930 or a monthly rate of 68,000,000 pounds. The total imports for 1931 showed a decrease of approximately 231,000,000 pounds for the year, or a drop of about 29.5 per cent. The exports of copper from the United States in 1931 totaled 557,873,744 pounds valued at \$54,747,810 as against 733,294,022 pounds valued at \$105,342,050 in 1930. The copper exports of 1931 included refined copper in ingots, bars, or other forms, 405,396,132 pounds valued at \$38,098,529; old and scrap, 66,551,996 pounds valued at \$5,438,358; rods, 58,872,186 pounds valued at \$6,182,446; and wire, 6,851,949 pounds valued at \$859,879.

Refineries reported that at the end of 1931 approximately 905,000,000 pounds of refined copper were in stock, a 47 per cent increase over the reserve of 615,000,000 pounds at the end of 1930. It was estimated that stocks of blister copper at the smelters, in transit to refineries, and at refineries, and materials in process of refining, were about 312,000,000 pounds on December 31, compared with 450,000,000 pounds at the end of 1930, a decrease of 138,000,000 pounds or 31 per cent. Total smelter and refinery stocks at the end of 1931 were 1,217,000,000 pounds, representing an increase of 152,000,000 pounds, or 14 per cent, over stocks at the end of 1930, and were 93,000,000 pounds higher than the various record stocks of 1920. The quantity of new refined copper withdrawn on domestic account during the year was about 909,000,000 pounds, compared with 1,265,000,000 pounds in 1930, a decrease of 356,000,000 pounds or 28 per cent. The method of calculating domestic withdrawals is shown in the accompanying tabulation.

In the Dominion of Canada copper production in 1931 was estimated at 200,581,122 pounds, valued at \$23,772,000, a decrease of 4 per cent in

**NEW REFINED COPPER WITHDRAWN FROM  
TOTAL YEAR'S SUPPLY ON DOMESTIC  
ACCOUNT, 1930-1931, IN POUNDS**  
[U. S. Bureau of Mines estimates]

quantity from the previous year, but because of the lower prices the total value of the output was less by 37 per cent. Corresponding estimates for 1930 were 303,350,644 pounds valued at \$37,990,226. See METALLURGY.

**COPYRIGHT.** Registrations for the fiscal year 1930-31, according to the report of the U. S. Register of Copyrights, numbered 164,642, as compared with 172,792 for the preceding year. Of these, 59,553 were classed as books, but included pamphlets, leaflets, and contributions to periodicals, those printed in the United States numbering 54,016, those printed abroad in a foreign language, 4339, while the remainder, 1198, were English books registered for *ad interim* copyright. The chief classes of the remaining registrations, in the order of numerical importance, were: Periodicals, 42,415 numbers; musical compositions, 31,488; prints and pictorial illustrations, 5813; photographs, 3618; dramatic or dramatico-musical compositions, 5784; works of art, including models or designs, 2551; maps, 2940; drawings or plastic works of a scientific or technical character, 1993; motion-picture photoplays, 940; and motion pictures not photoplays, 986. The renewals numbered 5998, as compared with 5937 in the preceding year. The fees applied during the year amounted to \$309,414. The total number of articles deposited during the fiscal year ended June 30, 1931, was 262,690.

The gross receipts of the Register's office for the fiscal year were \$312,865; the total expenditure for salaries, \$233,133, and for supplies, \$1444. The year's business was not quite so large as that of the previous year, due no doubt to the general depression affecting all lines of business. No new copyright proclamations were issued extending to nationals of other countries the privilege of securing copyright in the United States in exchange for a like privilege accorded to American authors by those countries.

**CORN.** As reported by the International Institute of Agriculture the estimated yields of corn in 1931 of 19 countries amounted to 3,327,041,000 bushels as compared with 2,733,191,000 bushels in 1930. The production of the southern hemisphere and of the Soviet Republics was not included in these estimates. The yield of the 19 countries reporting was 21.7 per cent above the

yield of the preceding year and 1.4 per cent below the annual average of the five years 1925-29. The area devoted to corn in these countries in 1931 was reported as 136,452,000 acres which was 4 per cent above that of 1931 and 5.9 per cent above the average annual area of the five-year period. The production of the leading corn producing countries in 1931 not including the United States was estimated as follows: Rumania 236,211,000 bushels, Yugoslavia 126,688,000 bushels, Italy 72,578,000 bushels (not including the early and quick ripening crop known as "cinquantino"), Manchuria 67,418,000 bushels, Hungary 57,605,000 bushels, Bulgaria 39,256,000 bushels, and Spain 23,428,000 bushels. The average annual yield of the Soviet Republics for the five years 1925-29 was estimated at 141,275,000 bushels produced on 8,386,000 acres and the area planted in 1931 was reported as 9,742,000 acres, or about 16 per cent above the five-year average. Data on the production in Argentina, other than on the crop of 1929-30 estimated at 249,156,000 bushels, were not available. The production of Canada in 1931 was reported as 5,643,000 bushels on 139,000 acres, the crop being 3.1 per cent below the yield of 1930 and 14.7 per cent below the five-year average and the corresponding reductions in acreage, 13.7 per cent and 20.2 per cent.

As reported by the Department of Agriculture the 1931 corn crop in the United States of 2,556,863,000 bushels was 24 per cent larger than the very short crop of 2,060,000,000 bushels in 1930 and 1 per cent larger than the 1929 crop of 2,535,000,000 bushels. The acreage of 104,970,000 was 4.2 per cent above that of 1930 and 7.3 per cent above that of 1929. The estimates of production included the acreage utilized for husking, silage, fodder or hogging down, the yield being expressed in equivalent bushels of ear corn. The average yield per acre in 1931 was 24.4 bushels or 4 bushels above the acre yield in 1930 and 1.5 bushels below this yield in 1929. The yields per acre in 1931 were materially higher in 1931 than in 1930 in the drouth area of that year but lower in the Western States. The acre yields were also higher in 1931 than in 1929 east of the Rocky Mountains except in the important corn States of Iowa, Nebraska, South Dakota, Minnesota, and Wisconsin where hot and dry weather and in some parts grasshopper damage reduced the crop. The value of the crop on the basis of the average farm price on December 1, 36 cents per bushel, the lowest since 1900, was \$920,142,000, also the lowest total value since 1900. The total yearly value of the corn crop on this same basis had stood continuously above one billion dollars from 1904 to 1930 inclusive.

The yields of the leading corn-growing States including all methods of harvesting were reported as follows: Iowa 389,940,000 bushels, Illinois 339,845,000 bushels, Nebraska 172,346,000 bushels, Missouri 170,000,000, Indiana 168,535,000 bushels and Ohio 160,920,000 bushels. In average yield per acre of the areas harvested for grain these States ranged from 45.5 bushels for Ohio to 17 bushels for Nebraska. The range for all States on the same basis was from 49.5 bushels for Pennsylvania to 8.2 bushels for South Dakota. The following States reported the largest areas devoted to the crop: Iowa 11,640,000 acres, Nebraska 10,138,000 acres, Illinois 9,185,000 acres, Kansas 6,505,000 acres, Missouri 6,184,000 acres, and Texas a total of 5,236,000 acres.

The production of corn for silage reported in terms of bushels of ear corn was 32,860,000 bushels in 1931, 29,899,000 bushels in 1930 and 29,342,000 bushels in 1929. As a rule the acreage cut for silage increases in years of low yields and decreases in years of high yields. The yield per acre of silage was 7.34 tons in 1931, 6.3 tons in 1930 and 7.3 tons in 1929. Wisconsin, a leading dairy State, cut the largest area, 1,095,000 acres, for silage in 1931. Minnesota, ranking next, cut 528,000 acres, New York 346,000 acres, Iowa 328,000 acres and Pennsylvania 317,000 acres. The corn cut for silage ranged in average yield of ear corn per acre from 11.3 bushels in Vermont to 2.4 bushels in South Dakota. The average yield per acre for all States was 7.34 bushels. The acreage cut for fodder, hogged down or grazed was 11,626,000 acres in 1931, 11,453,000 acres in 1930, and 10,589,000 acres in 1929. For these years the largest areas were harvested in this way in South Dakota, Iowa, and Minnesota and in 1931 the acreage so harvested were 2,340,000, 1,351,000, and 1,252,000 acres respectively.

A study by the U. S. Department of Agriculture indicated that the cost of producing the 1930 corn crop on 3616 farms was 89 cents per bushel. Although the acre costs were generally lower in 1930 than in 1929 the cost per bushel, owing to the low yields of the year, was 16 cents higher. The stocks of corn held on farms as of November 1, 1931, was reported as 92,837,000 bushels, the largest since 1928. The corn exports of the United States for the fiscal year ended June 30, 1931, amounted to 2,529,000 bushels as compared with 9,354,000 bushels in 1930. In addition to the grain 197,000 barrels of corn meal, 3,255,000 pounds of corn breakfast food, 8,259,000 pounds of hominy and grits and 915,000 pounds of corn oil were exported during the same period. The eighth National Corn Husking Contest was held Nov. 13, 1931, near Grundy Center, Iowa, and Orville Welch of Illinois won the national title by husking 31.38 bushels in 80 minutes.

**CORN BORER.** See ENTOMOLOGY, ECONOMIC.  
**CORNELL UNIVERSITY.** A nonsectarian institution for the higher education of men and women in Ithaca, N. Y., founded in 1865. There were 6136 students enrolled in the autumn session of 1931, distributed as follows: Graduate school, 955; law school, 154; medical college, the main division of which is in New York City, 239; arts and sciences, 1963; architecture, landscape architecture, and fine arts, 170; engineering, 1034; veterinary medicine, 194; agriculture, 881; and home economics, 594, including 189 enrolled in a four-year course in hotel administration. Of these students 1390 were women. The registration for the 1931 summer session was 2440. The faculty, composed of 1250 members, had 320 professors, 222 assistant professors, 16 lecturers, 385 instructors, and 307 assistants.

The board of trustees created the office of provost of the university to relieve the burden on the president's office and promoted to the new office Albert R. Mann, dean of the State colleges of agriculture and home economics, appointing Cornelius Betten acting dean of those colleges. Additions to the staff of professors included George H. Sabine in philosophy, Edwin Nungezer in English, John H. Parker in plant breeding, and William C. Ruediger in education. The faculty lost by death John H. Comstock, professor of entomology, emeritus; Irving P.

Church, professor of applied mechanics and hydraulics, emeritus; Whitman H. Jordan, professor of animal nutrition, emeritus; Lucius L. Van Slyke, professor of dairy chemistry, emeritus; George T. Elliot, professor of clinical medicine, department of dermatology, emeritus; Herbert J. Davenport, professor of economics, emeritus; Veranus A. Moore, professor of veterinary pathology, emeritus; Pierre A. Fish, professor of veterinary physiology and dean of the veterinary college; Harold E. Santee, professor of clinical surgery; and David F. Hoy, registrar; and, by retirement, Charles H. Hull, professor of American history, and Walter F. Willcox, professor of economics and statistics. Visiting lecturers in chemistry on the George Fisher Baker foundation were Prof. N. V. Sidgwick of Oxford University and Prof. Cecil H. Desch of the University of Sheffield.

Announcement was made in October that Dr. Jacob Papish of the department of chemistry had extracted from the mineral samarskite a chemical element which he had identified as No. 87, one of the two heretofore unknown elements of the periodic system. The university dedicated its War Memorial, a group consisting of twin towers and a connecting cloister incorporated in the men's dormitory system, and virtually completed Myron Taylor Hall, to house the law school and its library. New York State laid the foundations of two large buildings on the campus, one for the college of home economics and the other for the department of farm management in the college of agriculture. Construction was far advanced on the medical centre, to be occupied jointly by the New York Hospital and the Cornell Medical College in New York City Sept. 1, 1932. There was also under construction at the close of the year another men's dormitory, Mennen Hall, the \$100,000 gift of William G. Mennen and his sister, Mrs. Elma Mennen Williams.

The productive funds of the university on June 31, 1931, were \$24,020,872. The income applicable to current expenses of the fiscal year 1930-31 was approximately \$8,000,000, including \$2,986,222 of State and \$438,596 of Federal appropriations. Gifts amounting to \$1,333,032 were received during the fiscal year. The lands and buildings were valued at \$10,800,000, and the equipment at \$4,700,000. The library contained 830,000 volumes. President, Livingston Farrand, M.D., L.H.D., LL.D. See AGRICULTURAL EXPERIMENT STATIONS.

**CORNWALLIS, SURRENDER OF.** See CELEBRATIONS.

**CORSICA.** An island in the Mediterranean, situated about 100 miles southeast of the French coast at Nice, constituting a department of France. With an area of 3367 square miles, it had a population of 289,890 in 1926. In November, 1931, the French Government sent a force of 1500 soldiers and special police to the island to wipe out banditry, which had long flourished in the wild and mountainous interior.

**COSACH (CHILEAN NITRATE COMPANY).** See CHILE under *Production and History*.

**COSMIC RAYS.** See PHYSICS.

**COSMOLOGY.** See ASTRONOMY.

**COSTA RICA,** *kos'ta rêkă.* A republic of Central America lying between Nicaragua and Panama, and bounded by the Caribbean Sea on the east and the Pacific Ocean on the West. The city of San José, located inland on the central plateau, is the capital of the republic.

**AREA AND POPULATION.** The area is estimated at 23,000 square miles. The population was 741,524 at the 1927 census, as compared with 243,205 at the census of 1892. The estimated population in 1930 was 516,000. Births in 1929 numbered 22,662, deaths 11,829, marriages 3098; the excess of immigration over emigration was about 500. Estimated populations of the chief cities in 1929 were: San José, 52,555; Alajuela, 8866; Heredia, 7900; Puntarenas, 7854; Limón, 7757; and Cartago, 7313. Roman Catholicism is the state religion but religious liberty is guaranteed by the Constitution. About 75 per cent of the population is of European descent, 10 per cent mestizo, 10 per cent Negro, and 5 per cent Indian.

**EDUCATION.** Elementary education is free and compulsory. Registration in the schools in 1929 was divided as follows: Public primary schools, 46,527; private schools, 3481; secondary schools, 2106. There were 478 public elementary schools, with 46,675 pupils, in 1930.

**PRODUCTION.** Costa Rica is primarily an agricultural country, with coffee and bananas, the chief commercial crops, accounting for about nine-tenths of the export trade. Large areas not yet cleared for cultivation contain cedar, balsa wood, and large and virtually untouched stands of cabinet woods. The area under cultivation in 1929 totaled 1,155,000 acres, of which 127,728 acres were planted to coffee, and 92,133 acres to bananas. The other leading crops, ranking according to the area planted, were corn, cacao, sugar cane, beans, rice, potatoes, tobacco, and manioc.

Since Costa Rican prosperity hinges directly upon the price received for the coffee crop, the collapse of coffee prices in 1930 and 1931, together with the lower prices received for bananas, cacao, and other exports, placed the country in a precarious financial situation by the end of 1931. The coffee crop for the 1930-31 season totaled 52,525,650 pounds, or 5 per cent less than the 1929-30 crop. Banana production in 1930 was 5,418,416 stems; cacao (exports), 11,908 metric tons. Both banana and cacao shipments declined in 1931 as compared with 1930. Gold and silver mining is important on the Pacific slope. In 1929, there were 6532 small factories and industries.

**COMMERCE.** Exports in 1930 totaled \$16,330,604, as against \$18,198,000 in 1929, a decline of 10 per cent. Imports, on the other hand, fell to \$10,846,590 from \$20,166,666 in 1929, a decrease of about 46 per cent. The trade balance was thus favorable by \$5,484,014, as compared with an unfavorable balance of \$1,968,666 in 1929. Coffee accounted for about two-thirds of the 1930 exports. Of the 1930 imports, the United States supplied nearly 50 per cent, Germany 12.28 per cent, Great Britain 12.13 per cent, and other countries 25.8 per cent. Purchases from the United States were valued at \$4,554,000 (\$8,261,000 in 1929) and exports to that country were \$4,812,722 (\$5,202,597 in 1929). Coffee, bananas, cacao, hides and skins, pineapples, and timber were the principal exports. In the five-year period 1926-30, Costa Rican exports were valued at an average of 72,947,894 colones (the colon was stabilized at \$0.25) annually, compared with an annual average of 39,819,894 colones for the period 1911-15 and with 20,245,849 colones for the period 1891-95.

**FINANCE.** Ordinary revenues in 1930 totaled 27,468,499 colones, or 3,750,000 colones less than budget estimates and nearly 8,000,000 colones less

than in 1920. Expenditures amounted to 32,513,819 colones—a figure believed not to include amortization of the public debt—which was 5,045,320 colones in excess of revenues. Of the total expenditures, the President stated in his annual message that 5,385,427 colones represented extraordinary expenditures for roads, schools, and water mains. The 1931 budget, as signed by the President, Apr. 1, 1931, estimated revenues at 26,906,000 colones and expenditures at 24,078,084 colones. The preliminary budget for 1932, as submitted to Congress, balanced at 28,290,000 colones, of which between 9,000,000 and 11,000,000 colones represented required interest and amortization payments on the public debt. Foreseeing a possible deficit of 11,000,000 by the end of 1931, the Government on Aug. 6, 1931, imposed a 10 per cent emergency customs surtax on all except food imports. By another emergency measure, Congress authorized the payment of November and December (1931) salaries of Government employees on a basis of 60 per cent cash and 40 per cent in notes of the Government.

The public debt at the end of 1930 totaled 94,094,752 colones, of which 25,753,562 colones represented the internal and 68,341,190 colones the external debt. A year earlier the total stood at 87,770,536 colones. Congress in April authorized the flotation of a new loan of 10,000,000 colones (\$2,500,000) to convert the internal floating debt, but the Government was unable to obtain the money on the terms provided for. An American bank in 1931 accepted short-term notes in payment of \$700,000 which the Costa Rican Government owed it as the balance of a \$1,000,000 loan obtained in September, 1930.

**COMMUNICATIONS.** In 1930 there were 413 miles of railway line, of which 81 miles (the Pacific Railway) were government owned. There were about 161 miles of motor highways. A reconnaissance survey of a section of the proposed Pan American Highway from Cartago to Canas Gordas on the Panama frontier was made during 1931 under the direction of an American engineer. Air-mail service between San José and Puntarenas was established in 1930; at Puntarenas connection is made with the Pan American Air lines. In 1929, 630 ships of 1,290,844 tons entered the ports and 628 ships of 1,293,799 tons cleared.

**GOVERNMENT.** The executive power is vested in the President who is elected for four years and legislative power in a chamber of representatives, called the Constitutional Congress, with 43 deputies, elected for four years, one-half retiring every two years. Voting for President, deputies, and municipal officers is secret, direct, and free. President in 1931, Don Cleto Gonzalez Viquez, who was elected on Feb. 12, 1928, for the term 1928-32. The Nationalist Union (government party) following the election of February, 1930, controlled 29 of the 43 seats in Congress.

**HISTORY.** Increased political activity in preparation for the Presidential election scheduled for Feb. 14, 1932, became evident early in 1931. The leading candidate to emerge was Ricardo Jimenez, twice President of the Republic. His opponents sought to present a coalition candidate, but Dr. Leon Cortes, former Minister of Public Works and Agriculture, and Dr. Ricardo Moreno Canas, who had also announced their candidacies, both refused to withdraw. The return to San José early in June of Manuel Castro Quesada, Minister to Washington, to participate in the campaign resulted in the resignation of the Cabinet,

June 14. The collapse of the Cabinet followed Señor Quesada's refusal to resign his Washington post while participating in the campaign. President González Viquez accepted four of the resignations offered him and filled three of the vacancies, but the Finance portfolio was still vacant at the end of June. On December 14, it was announced that members of both the National Army and of the Communist party would be barred from voting in the Presidential election.

The financial and economic condition of the country remained the Administration's chief problem. Besides the steps to balance the budget listed under *Finance*, Congress on May 29, 1931, authorized the President to establish a monopoly on the importation and sale of gasoline. Government monopolies on insurance and alcohol had been previously established. A decree of August 20 established a national financial and economic council to advise Congress on proposed legislation. Another law signed by the President in December established the first income tax in the history of the country. A prominent political figure passed from the scene with the death at San José, Jan. 28, 1931, of Bernardo Soto Alfaro, President of the Republic from 1885 to 1900.

Strong opposition to the political and economic activities of United States citizens affecting Costa Rica was reported from San José during 1931. In connection with the survey by American engineers of a proposed Pan American Highway through Costa Rica, the San José papers were reported as lukewarm or hostile to the project on the ground that it would result in further control of Central American affairs by the United States Government. The *New York Times* correspondent in Panama on September 8 reported a wave of extreme nationalism in Costa Rica, taking the form of anti-foreign and particularly of anti-American propaganda. See PANAMA.

**COTTON.** The Crop Reporting Board of the U. S. Department of Agriculture estimated on Dec. 8, 1931, that the cotton crop of the United States for 1931 would amount to 16,918,000 bales of 500 pounds, compared with 13,932,000 in 1930, and 15,268,000 bales, the 1925-1929 average ginnings. The estimated crop was the second largest produced, the record being 17,977,000 bales in 1926. The yield of lint per acre was estimated to average 200.1 pounds as compared with 147.7 pounds in 1930, and 154.4 pounds, the average for the period 1920-1929. Of 40,954,000 acres in cultivation July 1, 1.1 per cent were abandoned and 40,495,000 left for harvest. The farm value of the lint was estimated at \$485,611,000 and of the 7,523,000 tons of cottonseed \$78,581,000 or a total of \$564,192,000 for the crop.

The world carry-over of American cotton on Aug. 1, 1931, was the largest since 1921, amounting to 8,768,000 running bales compared with 6,377,000 bales in 1930 and 4,564,000 in 1929. There were 2,481,000 bales of Indian cotton, 914,000 of Egyptian, and 1,176,000 bales of sundries, totaling 13,339,000 or 18.7 per cent over 1930. The New York Cotton Exchange estimated the carry-over of all cotton at 13,948,000 bales and production in 1931 at 27,000,000 bales. H. G. Hester of the New Orleans Cotton Exchange estimated the carry-over of American cotton at 9,130,000 bales. The supply for the 1931-32 season, according to the U. S. Department of Agriculture, was well above the previous record sup-

ply of 1926-27 and more than twice as large as the world's consumption of American cotton in 1930-31.

The areas planted to cotton in 1931 in important cotton growing countries amounted to 73,869,000 acres or about 5.4 per cent less than in 1930. Production in 1931 in the countries (reporting) was estimated to be for the United States 16,918,000 bales; U. S. S. R. (Russia), 2,000,000; China, 1,800,000; Egypt, 1,280,000; Brazil, 600,000; Mexico, 211,000; and Chosen (Korea), 136,000 bales.

The world's production of commercial cotton in 1930 was estimated by the U. S. Bureau of the Census to be 25,304,000 bales, of which the United States produced 13,756,000 (running) bales; India, 4,800,000; U. S. S. R. (Russia), 1,550,000; Egypt, 1,661,000; China, 1,590,000; Brazil, 493,000; Peru, 240,000; Mexico, 169,000; and all other countries 1,045,000 bales. The International Institute of Agriculture reported the 1930 crops of the principal cotton-growing countries to be, for the United States, 13,932,000 bales; India, 4,033,000; Egypt, 1,675,000; U. S. S. R. (Russia), 1,549,000; Mexico, 178,000; Chosen, 152,000, and Uganda, 156,000. Anglo-Egyptian Sudan produced 106,000 bales from 387,000 acres.

The cotton crop of the United States for 1930, as reported by the Bureau of the Census, the estimated crop for 1931, and the quantity reported ginned to Dec. 13, 1931, are shown in the accompanying table.

UNITED STATES COTTON CROP, 1930-31

States	Crop, 1930 500-lb. bales	Estimated crop, 1931 500-lb. bales	Reported ginned Dec. 13, 1931 Running bales
United States . . .	13,931,597	16,918,000	15,358,405
Alabama . . . . .	1,473,287	1,430,000	1,374,133
Arizona . . . . .	155,409	119,000	62,769
Arkansas . . . . .	874,355	1,855,000	1,521,986
California . . . . .	263,766	181,000	144,258
Florida . . . . .	50,306	43,000	43,086
Georgia . . . . .	1,592,539	1,995,000	1,864,828
Louisiana . . . . .	714,529	865,000	830,577
Mississippi . . . . .	1,464,311	1,725,000	1,553,307
Missouri . . . . .	150,955	270,000	212,566
New Mexico . . . . .	98,462	98,000	70,450
North Carolina . . . . .	774,734	775,000	750,271
Oklahoma . . . . .	853,584	1,220,000	1,108,036
South Carolina . . . . .	1,000,892	1,015,000	988,279
Tennessee . . . . .	376,912	605,000	520,752
Texas . . . . .	4,039,136	5,270,000	4,764,386
Virginia . . . . .	41,952	43,000	40,845
All others . . . . .	6,467	9,000	8,076

The table includes for 1931, under the ginning report, 535,337 round bales counted as half bales and also 7925 bales of American-Egyptian cotton, practically all grown in Arizona. The 1931 crop of Arizona was estimated to include 15,000 bales of American-Egyptian cotton. The crop of Lower California, usually marketed through California, was estimated at 28,000 bales, not included in the totals.

Oil mills in the United States, during the cotton year ended July 31, 1931, crushed 4,715,148 tons of cottonseed. The products of the seed included 823,944 bales of lint, 1,303,504 tons of hulls, 2,164,820 tons of cake and meal, and 1,441,881,530 pounds of oil.

Exports of cotton and lint for the year ended July 31, 1931, amounted to 6,759,927 bales of cotton and 111,969 bales of lint or a total of 6,871,896. Mills in the United States consumed

in this period 5,262,974 bales, versus 6,105,840 in the previous year. The principal exports were to Germany, 1,639,947; United Kingdom, 1,053,774; France, 914,223; Italy, 476,508; other European countries, 708,999; and Japan, 1,228,410 bales. During the same period there were imported from Egypt, 22,902 bales; Peru, 2373; China, 31,177; Mexico, 15,126; British India, 34,218; and from other countries, 1733 bales.

Most of the cotton used by American mills was consumed in the cotton-growing States, 4,155,148 bales versus 936,678 in New England, and 179,122 in other States. Of 32,326,526 spindles in place Dec. 31, 1931, 24,637,864 were active during December, of which 16,855,940 were located in cotton States, 6,791,252 in New England, and 990,672 in other States. The number of active spindle hours averaged in cotton States 240, in New England 100, and elsewhere 127, and the percentage of idle spindles was highest in New England.

The world's consumption of cotton (exclusive of linters in the United States) for the year ended July 31, 1931, according to the U. S. Bureau of the Census, was about 22,402,000 bales. The International Federation of Master Cotton Spinners' and Manufacturers' Associations reported it to be 22,483,000 bales compared with 25,209,000 in the previous year. Compared with 1929-30, mill consumption in 1930-31 of American cotton showed a decline in all countries of 2,100,000 bales or 16.2 per cent; Indian cotton, 3.7 per cent; Egyptian, 9.1 per cent; and sundries, 5.8 per cent. The total of all cotton consumed was less in all important countries except China and India with the greatest declines in Italy, Great Britain, and Germany. The relative gain in consumption of foreign cotton during recent years, as viewed by the U. S. Department of Agriculture, reflects the severe competition that these cottons have offered in world markets, the greater severity of depression in countries that consume American cotton mostly, and to some extent, a turning of mills to cheaper cottons in order to meet price competition at the expense of quality.

Middling  $\frac{7}{8}$ -inch cotton at the 10 spot markets averaged 9.61 cents per pound during the year ended July 31, 1931, compared with 15.79 cents in 1929-30, and 18.67 cents in 1928-29. For August, 1931, the price averaged 6.57 cents, September 5.83, October 5.75, November 5.95, closing on December 31, at 6.50 New York, 6.31 New Orleans, and 6.35 at Galveston. The average price being paid to producers on Dec. 1, 1931, was 5.7 cents per pound for lint and \$10.45 per ton for cottonseed, compared with 9.5 cents and \$21.61 respectively, on Dec. 1, 1930.

Severe declines in cotton prices in the last two years resulted from greatly reduced demand and large supplies of cotton, and more general conditions causing a depression of international commodity price levels. The world business depression and falling consumer incomes reduced both the price of cotton and the quantities consumed. The world production of cotton was not reduced in line with the declining consumption and large stocks accumulated. Reduction of cotton acreage in the United States in 1931 did not suffice to strengthen the market nor did reduced expenditures make the crop profitable. Hundreds of proposed cotton surplus relief plans, advocated after the August 1 cotton forecast disclosed a bumper crop which would add to existing large

supplies, were not satisfactory. The drastic measure of destroying one-third of the current crop was rejected in the cotton-growing States. In several Southern States, legislative proposals were made to reduce acreage sharply in 1932. The Federal Farm Board and southern bankers in October, 1931, approved a plan to hold about 7,000,000 bales of cotton off the market until July 31, 1932 in an effort to prevent further shrinkage of price during the current season.

Recommending the adjustment of cotton production to market requirements, Secretary of Agriculture Hyde stated that there was no question of withdrawing from the foreign market. American growers could compete with foreign producers, and cotton was generally more profitable or less unprofitable than other crops that could be grown in the South. The United States had demonstrated its ability to hold its place in spite of the boll weevil, and in the face of increasing foreign competition. The immediate need, he indicated, was more attention to means of reducing production costs and improving the quality of the crop, while at the same time its volume should be adjusted more nearly in harmony with the world's demand. Land that cannot grow cotton profitably under average conditions should be eliminated from cotton growing. Efforts should be continued to improve the staple and the spinning qualities of cotton.

The cotton crop season of 1931 was described by the U. S. Department of Agriculture as extraordinarily favorable for cotton production. Conditions during the growing season were good, few fields were abandoned due to lack of or excess of moisture, and because of the scarcity of cash, abundance of labor and unusually favorable weather during the harvest period, very little cotton was left in the fields. Planting conditions generally were favorable and spring weather held back the boll weevil. The condition on August 1 approximated 75 per cent of normal and weevil infestation was much below average. Growing conditions during August in general were favorable except in the Delta sections of Arkansas and Mississippi, where excessive stalk growth was accompanied by poor fruiting and greater weevil infestation, yet abandonment was reported as less than average. September proved exceptionally favorable, particularly in Arkansas and Mississippi; hot dry weather kept down weevil damage and hastened maturity of the cotton. Weather in October was also much more favorable than usual; the high temperatures aided opening of the bolls, there was a general absence of injurious rains, picking went on with little interruption, and field loss was held to a minimum. November was about average in its influence upon cotton picking. The weather continued favorable early in the month but was not so good in the latter part of November.

The pink bollworm, established only in rather small areas in southwestern United States, still constituted a serious threat. Eradication was undertaken where practicable and efforts were made in infested areas to prevent its spread to the main cotton-growing regions, where no infestation has been discovered. The non-cotton zones created in the Salt River Valley of Arizona to eradicate the worm were not the success hoped for, infestation being found over much wider areas. In 1931, these zones were replaced by State regulation of planting dates and cultural methods in certain areas to reduce the

population of pink bollworms to a point where eradication may again be undertaken. Gin trash machines showed this pest to be present in all of the older areas of infestation from Midland County, Texas, to eastern Arizona, except in the Duncan Valley. Outside the regulated areas, the machines were operated in California, Arizona, Texas, and New Mexico, with negative results. The initial infestation of the boll weevil in 1931 was comparatively small, and hot dry weather at intervals in spring and summer resulted in less than average damage although greater than in 1930. Control agencies gave the usual attention to the boll weevil, *Thurberia weevil*, bollworm, cotton leaf perforator, and cotton flea hopper. See ENTOMOLOGY, ECONOMIC.

Cotton of the 1931 crop ginned prior to Dec. 1, 1931, was higher in grade and longer in staple than ginnings before Dec. 1, 1930, according to a report based on the 15,016,820 bales of American upland cotton reported by the Census Bureau as ginned prior to that date. Estimates were that 92 per cent was white in color, 78.5 per cent was white, middling and better, and 5.7 per cent cotton other than white and extra white. In staple length, 5.6 per cent was estimated to be shorter than  $\frac{7}{8}$  inch; 82.9 per cent,  $\frac{7}{8}$  to  $1\frac{1}{32}$  inches, inclusive, and 11.5 per cent,  $1\frac{1}{16}$  inches and longer. Of a total of 14,016,700 bales, or 93.3 per cent tenderable, 12,293,800 bales, ranged in staple from  $\frac{7}{8}$  to  $1\frac{1}{32}$  inches, inclusive, and 1,722,900 bales stapled over  $1\frac{1}{32}$  inches.

The International Universal Cotton Standards Conference held its fourth biennial session in Washington in May, 1931, and approved copies of the universal standards for American cotton for use of the U. S. Department of Agriculture and European organizations during the two-year period beginning August 1, 1931.

The International Cotton Congress, held in Paris, June 23-25, 1931, centred its deliberations around the causes of the depression in the world's cotton industry and the suggested remedies. Other subjects dealt with were the market situation, the sale of cotton, the factors affecting price trends, and mass production in the United States. The next congress was planned to be held in 1933 at Prague.

The cotton crops in 1929-1930 in the principal producing countries in the British Empire, excluding India, were estimated to be for Anglo-Egyptian Sudan, 139,000 bales; Uganda, 100,000; Nigeria, 36,492; Tanganyika, 23,251; Union of South Africa, 13,485; Australia, 11,000; West Indies, 4000; Iraq, 3851; Nyasaland, 5098; and Cyprus, 2946. In India, 4,191,000 bales were reported for 1930-1931, and 3,910,000 for 1929-1930, and the total area planted in 1930-1931 was estimated to be 20,500,000 acres. The crop expected from the acreage planted to December 1, was forecast at 3,428,000 bales.

The production estimated for 1929-1930 in other political divisions of the world, besides the major cotton countries, was for Argentina, 150,000 bales; Paraguay, 18,000; Colombia, 4000; Spain, 3000; Algeria, 8000; Dahomey, 8025; French Sudan, 12,822; Italian Somaliland, 5083; Mozambique, 7192; Syria and Lebanon, 14,000; French Indo-China, 4654; and Dutch East Indies, 4061 bales.

Egypt produced in 1930-31 a crop estimated at 1,661,000 bales, compared with 1,768,000 in 1929-30. Of about 1,637,000 bales of the 1930-31 crop, reported by the International Institute of

Agriculture as ginned by July 1, 1931, around 400,000 bales or 24 per cent was Sakellarides. The 1931-32 crop was estimated at 1,286,000 bales, with 37 per cent less of Sakellarides and 18 per cent less of other varieties produced than in the previous year. The Egyptian Government appropriated funds which were to be used for an extensive campaign for the promotion of the sale of Egyptian cotton.

Russia, according to late estimates, produced about 2,000,000 bales in 1931 as compared with 1,550,000 in 1930. The area was reported at 5,824,000 acres compared with 3,870,000 in 1930, an increase of 50.5 per cent. Up to December 1, 58 per cent of the raw cotton procuring plan was procured compared with 62 per cent in 1930, although the actual quantity was reported as about 22 per cent above 1930. These conditions were variously attributed to poor organization, reduced yields due to poor field work, overestimation of the crop, etc. The new cotton producing regions in 1931 constituted about 18 per cent of the total area in cotton.

**COTTON, JOSEPH POTTER.** An American lawyer, died in Baltimore, Md., Mar. 10, 1931. He was born in Newport, R. I., July 22, 1875, and was graduated from the Harvard University Law School in 1900. He practiced in New York City until 1929, being associated with Cravath, Henderson and de Gersdorff (1907-08), Spooner and Cotton (1910-19), McAdoo, Cotton and Franklin (1919-21), and Cotton and Franklin (1921-29). He was recognized as an authority on corporation law and participated actively in many important organizations, reorganizations, mergers, and receiverships. After 1915 he served as counsel to the New York State Commission on Workmen's Compensation, and was consulting counsel of the Federal Reserve Board and of the U. S. Shipping Board. He was chief of the meat division of the U. S. Food Administration in December 1917, and the following year was European representative of the Federal Food Administration. During the War he was also a member of the Inter-Allied Finance Council. In 1929 he was appointed by President Hoover Under-Secretary of State. He edited *Constitutional Decisions of John Marshall* (1906).

**COURT GAMES. RACQUETS.** For the tenth time since 1915 Clarence C. Pell, of New York,

won the national racquets championship in 1931. After losing to his doubles partner, Stanley G. Mortimer, of Tuxedo, in the final of the Gold Racquet tournament at Tuxedo Park, Pell exhibited some of the best play he had ever shown in the national and downed Mortimer in the final. Together these two veterans won the national doubles crown. Charles Williams, of Chicago, the world's professional racquets champion, was not called upon to defend the title he won in 1930.

**COURT TENNIS.** William C. Wright of Philadelphia, who had seen plenty of first-class court tennis play as the doubles partner of Jay Gould, was the sensation of the 1931 season, triumphing in the national tournament when Lord Aberdare of England, 1930 winner, did not defend his crown. Wright and Gould regained their doubles laurels when they defeated Edward M. Edwards and John C. Bell, Jr., of Philadelphia, in the final after the beaten pair had surprised by decisively downing the defending champions—George W. Wightman and Frank P. Frazier of Boston. Pierre Etchebaster of France, world's professional titleholder, did not receive any challenges of his supremacy during the year.

**SQUASH RACQUETS.** Both squash racquets and squash tennis benefited in 1931 by the adoption of a standard court that may be used for both games. It was possible for the adherents of both games to use the courts in clubs where their use was formerly limited to one game or the other, thus opening them to wider use and aiding the general economic spirit. J. Lawrence Pool, of the Harvard Club of New York City, was the individual star of the squash racquets season, regaining the national amateur title as well as winning the Metropolitan crown. In the national championship Pool dethroned Herbert N. Rawlins Jr., of the Racquet and Tennis Club. Beekman Pool, brother of the national champion, captured the first intercollegiate tournament ever held, at the University Club in New York and completed a successful year by winning the Gold Racquet at the Rockaway Hunting Club in December. Miss Ruth Hall of Philadelphia won the women's national title and the team title went to the same city, breaking the Boston grip on the laurels. New York, which had gained permanent possession of the Lockett Trophy in 1930 by its third victory in the team matches with Philadelphia and Boston, continued its success by gaining the first leg on the new trophy in 1931. Canada won the Lapham Trophy when the United States team, including few of the ranking players, bowed, 6 to 5, at Quebec.

In other divisions of the game, Harvard University won the national team championship, Neil R. Sullivan and Roy R. Coffin of the Germantown Cricket Club paired to win the Lockett Doubles Trophy, Jack Summers, coach at Massachusetts Institute of Technology captured the professional title, the Racquet and Tennis Club won the Class A Metropolitan team laurels and Class B team Metropolitan honors fell to the Harvard Club. F. Morgan Palmer of the Princeton Club gained the Class B Metropolitan individual championship.

**SQUASH TENNIS.** All three leaders in squash tennis successfully retained their titles in 1931. Harry F. Wolf, of the N. Y. Athletic Club, national champion, Dr. Harold R. Mixsell of the Princeton Club, perennial national veterans' champion, and Frank Ward of the City Athletic

Club, world's open champion and likewise national professional king. Ward was invincible, as he has been since the retirement of the former titleholder, Walter A. Kinsella, and turned back a spirited bid by the capable Rowland Dufton in the open final in February.

Wolf turned back his old rival, Rowland B. Haines of the Columbia University Club, in the final of the national amateur tournament, and Mixsell scored his sixth consecutive triumph in the veterans' play, defeating John C. Neely, also of the Princeton Club in the final. This veterans' tourney was inaugurated in 1926 when it was won by Charles M. Bull Jr., but Mixsell has won it every year since besides earning a national ranking in the first ten each season.

The New York Athletic Club team, led by Wolf, won the Metropolitan League Class A race, while Class B honors went to the Columbia University Club and the Crescent Athletic Club won Class C laurels. Frank R. Hanson of the Columbia Club broke through a fine field to win individual Class B. honors and the Class C championship went to Crosby Allison of the Crescent A. C.

**COWLEY, SIR ARTHUR ERNEST.** A British scholar and librarian, died Oct. 12, 1931, in London. Born in 1861, he attended St. Paul's School and Trinity College, Oxford. After acting as assistant master at Sherborne School (1885-89) and Magdalen College School, Oxford (1890-95), he was appointed assistant sub-librarian of the Bodleian Library, Oxford. He was promoted to sub-librarian in 1900 and librarian in 1919, retiring in 1931. In 1912 he was Sandars reader in bibliography at Cambridge University. He was also a Fellow of Magdalen College, Oxford.

He is known chiefly for reviews and reference works on Hebrew language and literature and cognate topics and published: *The Original Hebrew of a Portion of Ecclesiasticus* (with A. Neubauer, 1897); *Gesenius' Hebrew Grammar* (trans. from the German, 1898); *Aramaic Papyri* (with A. H. Sayce, 1906); *Catalogue of Hebrew Manuscripts in the Bodleian Library* (vol. ii, 1906); *The Samaritan Liturgy* (2 vols., 1909); *Judith, in Charles' Apocrypha* (1914); *Jewish Documents of the Time of Ezra* (1919); *The Hittites* (Schweich lectures, 1920); *Aramaic Papyri of the Fifth Century B.C.* (1923); and *Catalogue of Hebrew Printed Books in the Bodleian Library* (1929).

**CRETE.** Fourth in size among the islands of the Mediterranean and the site of an ancient civilization, Crete was ceded to Greece by Turkey, May 30, 1913. It lies 150 miles southeast of Greece. Area, 3326 square miles, population (census of 1928), 386,427. The capital, Canea, had 26,604 inhabitants (1928); Candia, the largest city, 33,404. Although two-thirds of the island consists of barren, mountainous region, agriculture is the sole industry, the chief products being currants, grapes, wine, olive, citrus fruits, some cereals, and garden products. In 1928 exports were valued at \$2,922,000 and imports at \$2,498,000. Extensive improvements to the port

of Candia were completed in 1931. The island is an intermediate station on the London-India air-mail line. Crete is administered as a department of Greece. See GREECE; ARCHAEOLOGY.

**CRICKET.** The Westchester County Cricket Club of Yonkers captured the 1931 cricket honors in the United States, winning the championships of the New York, New Jersey, and Metropolitan Cricket Associations. In addition the team won the first cup competition of the newly organized United States Cricket Association. The Westchester team led Brooklyn by one point in the Metropolitan League standing, in which the Fowler Cup was at stake. The two teams met in the U.S.C.A. final. After a tie in the first match, the Westchester County team won the second. Yorkshire was the county champion of England. H. Sutcliffe was the batting champion and S. Larwood the bowling leader. A. Ratcliffe of Cambridge made 203 runs in one individual inning for high score of the season.

**CRIME.** WICKERSHAM COMMISSION. On August 23, the National Commission on Law Observance and Enforcement issued its final report and terminated its activities after a two years' study of the subject of law observance and enforcement in the United States. (See previous YEAR BOOK.) In all, a total of 14 reports were submitted comprising 4023 printed pages and including some 1,600,000 words. The reports were as follows: (1) Preliminary Report on Observance and Enforcement of Prohibition, in which recommendations were made for the transfer of prohibition enforcement from the Department of the Treasury to the Department of Justice, together with certain changes in court procedure to handle dry law cases more expeditiously. (2) Report on the Enforcement of Prohibition, in which the Commission as a whole recommended the further trial of the Prohibition law. However, in appended individual statements, the majority of commissioners expressed their doubts concerning the possibility of adequate enforcement and suggested changes in the present system. (3) Report on Criminal Statistics, in which it was found that no adequate statistics were available on the subject of crime.

(4) Report on Prosecution, in which it was found that the prosecution arm of the law enforcement system the country over was hampered by petty politics and patronage. (5) Report on the Enforcement of Deportation Laws of the United States, in which there was presented a record of "dark age cruelty" on the part of the Federal Bureau of Immigration. (6) Report on the Child Offender in the Federal System of Justice, in which it was found that the Federal system of criminal justice had no proper machinery with which to deal with the child offender. The major recommendation called for the turning over of this problem to the States entirely. (7) Report on the Federal Courts, which pointed to congested conditions. (8) Report on Criminal Procedure, in which it was stated that both in Federal and State jurisdictions criminal procedure in the United States was antiquated and ruled by politics. (9) Report on Penal Institutions, Probation and Parole, in which there was charged that inhuman methods of handling persons still existed in the United States. (10) Report on Crime and the Foreign Born, in which the foreign born were exonerated from responsibility for a disproportionate share of the commission of crime in the country. (11) Report on

Lawlessness and Law Enforcement, in which there was incorporated a strong indictment of police officers and their use of third degree methods. (12) Report on the Cost of Crime, in which the nation's annual crime bill was said to reach far above \$1,000,000,000. (13) Report on the Causes of Crime, in which the Commission admitted that the underlying factors in the present era of lawlessness were too diverse to permit of simple statement. (14) Report on Police, in which the Commission found that apprehension of criminals by police was being hampered by corrupt politicians and antiquated police methods.

Extended discussions of reports Nos. 1 and 2 (relating to Prohibition) will be found in the article of that name in this YEAR BOOK. A discussion of Report No. 6 (relating to the Child Offender) will be found in the article CHILD WELFARE in this volume. The more important of the remaining reports are summarized herewith.

**CRIMINAL PROCEDURE.** In Report No. 8, filed with the President by the National Commission on Law Observance and Enforcement in July, there was to be found an elaborate examination of the faults inherent in the administration of justice in the United States through the courts. The Commission concerned itself largely with the country's inferior or magistrates' courts, and found that "arbitrary methods, incompetent magistrates, tribunals governed by petty politics and slovenly proceedings, at the point at which the great mass of the population come in contact with law enforcement, give a bad impression of the administration of justice as a whole and most seriously affect respect for and observance of law generally." The Commission emphasized the fact that a change of attitude was necessary by both the legal profession and the public as to the mode of choice, tenure, and personnel of the bench, particularly as regards the magistrates' courts.

The Commission's report contained 14 recommendations calling for reforms of a procedural nature. These included a wider use of administration, rather than arrest and prosecution, with respect to police regulations. The bad physical surroundings of the court rooms, the confusion and the want of decorum, seriously needed remedying. The fact that cases were frequently tried in the press raised a difficulty as to the employment of the jury system in criminal cases and made the obtaining of impartial panels a real problem. The Commission also suggested a wider use of summonses instead of arrest, elimination of "double appeal" and retrial as a matter of course, adoption of the system of "short indictments," examination of prospective jurors by the court rather than counsel, legislation by the States to allow waiver of jury trial in criminal cases, and elimination of the motion for "arrest of judgment."

Incorporated in the body of this report was to be found a passing reference to the judicial procedure attending the famous Mooney-Billings case. It will be recalled that Mooney and Billings had been held imprisoned in California jails for their alleged participation in the bomb explosion in the Preparedness Day parade in San Francisco in 1916. In discussing the faults inherent in California's criminal procedure as bearing on this case, the Commission said:

Motions for new trials upon the ground of after-discovered evidence, or upon evidence of perjury committed by material witnesses on the trial discovered after

judgments, in some jurisdictions have been held to be inadequate to prevent injustice.

This was peculiarly manifest in the famous Mooney case in California where, upon appeal to the Supreme Court of the State from the judgment of conviction of murder and an order of the trial court denying motion for a new trial, that court held that a new trial could not be granted upon matter not appearing in the record, even tho the new matter consisted of evidence charging perjury on the part of a material witness for the State, and altho the Attorney-General stipulated that the motion might be granted.

Further application made to the trial court in the nature of an application for common-law writ of *coram nobis* upon the ground that the prosecuting attorney had been guilty of fraud in withholding from the trial court information impeaching the testimony of certain witnesses for the State also was denied upon the ground that under the California practice the court had no power to grant such a motion.

The Supreme Court of that State held that there was no judicial remedy open in such case. The only remedy was the exercise of executive clemency.

Such a state of the law is shocking to one's sense of justice.

**PENAL INSTITUTIONS, PROBATION, AND PAROLE.** Report, No. 9 issued by the Wickersham Commission, criticized the present system of penal institutions in the United States as being generally antiquated, inadequate, unsanitary in health conditions, inefficient in administration, and unequal to the task of preparing the inmates for life in the community. The report recommended improvements in official personnel; a new system of prison industry which should provide for the payment of wages to prisoners as an incentive to good work; development of a better programme of character education, vocational education, and the leisure-time interests of prisoners; extension under adequate safeguards of the indeterminate sentence; the broadening of probation with central supervision; well staffed, well financed and properly organized system of parole. Among other things the report says:

The prison has failed as an educational institution. No one claims that the men who are released are better equipped to accept an honest rôle in the world than they were before commitment. The prison has failed as a disciplinary institution. The riots, the fires, the use of cruel and brutal measures of punishment, the persistent recurrence of murder within the prison, the presence of narcotics, the frequent atmosphere of hate and bitterness, are sufficient evidence.

The Commission found that there were more than 3000 Federal and State prisons, reformatories, workhouses, prison farms, chain gangs and county and city jails, most of them being overcrowded, Federal institutions in 1930 showing a population of 65.9 per cent greater than capacity. In its conclusion the Commission declared:

We are convinced that a new type of penal institution must be developed, one that is new in spirit, in method, and in objective. We consider it both unwise and unnecessary for the States to spend large sums of money in the construction of maximum security, congested prisons of the Auburn, New York, type. Experience has amply demonstrated that only a small proportion of the prison population requires fortresslike buildings. With proper classification of the prison population, the present overcrowded conditions can be relieved by housing a large number of the inmates in simple and inexpensive buildings of the minimum and medium security type.

**THE FOREIGN BORN.** In Report No. 10 of the National Commission on Law Observance and Enforcement, there was to be found a complete exoneration of the foreign born of the country for the major blame in the commission of crime. In fact, according to the Commission, the foreign born in proportion to their numbers committed considerably fewer crimes than the native born. The Report further declared that the nationals

of other countries residing in the United States "approach the record of the native born most closely in the commission of crimes involving personal violence, and that in crimes for gain the native born greatly exceed the foreign born. Accepting Dr. Edith Abbott's conclusions that the country's crime record could not rightly be charged against immigrants and that an inefficient and corrupt system of police and an outworn system of criminal justice were at the heart of the difficulty, the Commission declared its belief that the future immigration policy of the United States could safely be determined on general economic and social grounds to the disregard of the heretofore commonly held crime factor.

Discussing further this important point, the Commission submitted that because of differences in race, religion, speech, and habits the foreign born had been driven into segregated minorities which were easily but many times erroneously charged with social misconduct. In the case of native born children of foreign parents, however, the commission was not prepared to enunciate a clear-cut judgment. On this point it said:

Whether or not the current impression of excessive criminal propensities among so-called foreigners generally can partially be justified by the existence of criminal propensities among children of foreign-born parents, it is impossible either to affirm or deny. Within the limits of the problem which it has been possible to study, we are now in a position to definitely say that any such impression as to the foreign-born is at variance with the facts.

"THE THIRD DEGREE." In Report No. 11 of the National Commission on Law Observance and Enforcement there was to be found a severe indictment of police methods employed in a group of 32 typical American cities over the past ten years. This report, prepared under the expert direction of Zechariah Chaffee, Jr., of the Harvard Law School, and Walter H. Pollak, and Carl S. Stern of the New York Bar, found that "third degree" methods were being illegally but systematically employed in most of the cities under examination. Such "third degree" methods included, according to the Commission: "punching in the face, especially a hard slap on the jaw; hitting with a billy; whipping with a rubber hose; kicking in the abdomen; tightening the necktie almost to the choking point." The police of New York City were found by the experts of the Commission to exceed all others in their use of "third degree" methods. Of the situation in that city the report declared: "Arrested persons come to station-houses or headquarters in good shape, and are seen, shortly afterward, in the Tombs with swollen faces, all sorts of bruises and cuts, and often with blood spots scattered over them."

THE POLICE. In Report No. 14, delivered in August, the National Commission on Law Observance and Enforcement found that political corruption, inefficiency, poor equipment, incompetent personnel and inadequate training of America's police forces were inherent in the country's inability to cope with crime. The Report in no uncertain terms declared that an unholy alliance existed between the police and corrupt politicians on one hand and criminal elements on the other. In discussing this "unholy alliance" the Report declared:

The well-known and often proven alliance between criminals and corrupt politicians which controls, in part, the police force of our large cities, might well be taken

as a primary cause of police inefficiency, since it rules the head and every subordinate, and lays a paralyzing hand upon determined action against such major criminals.

The latter are well known to the police, but, by reason of the sinister influence exerted by corrupt politicians over the chief and his force they are allowed to continue their criminal careers when, but for such influence, the police force would make a much better showing, defective as it is in the right personnel and in modern crime-detecting instrumentalities.

Among the results produced by this union between politicians and the police and the criminals the Commission noted the following: there was a general loss of public confidence in the police of the country because of their failure to detect and arrest criminals guilty of serious crime. The prevailing practice of appointing police chiefs for short definite terms or for indefinite terms without security of tenure had made the American police departments the playthings of crooked politicians. On this point the Report declared: "In cities where the chief must be blindly obedient to orders from the Mayor, and where that dignitary in some instances is the political creature of killers and crooks of every conceivable character, administration of police affairs must of necessity sink to the level of the controlling influences." The Commission pointed out that in the cities of Milwaukee, San Francisco, Cleveland, St. Louis, and Detroit were to be found commendable police systems divorced from politics. In the cities of Los Angeles, Kansas City, Minneapolis, and Denver, however, "the antithesis of proper policing exists."

NEW YORK STATE. By a resolution passed in March of the year, New York State's legislature appointed a legislative commission for the purpose of inquiring into the public affairs of New York City and voted \$500,000 to defray the expenditures of the investigating body. This commission, which was popularly known as the Hofstadter Committee, named after its chairman, employed Samuel Seabury as counsel and proceeded to an elaborate examination of the official and unofficial acts of many persons associated with the conduct of the government of New York State's metropolis. On April 20, the committee first assembled, on June 2, Mr. Seabury named his legal staff of 21 assistants; on June 6, assignments were made to these persons to investigate all leading city departments such as police, buildings, courts, docks, borough offices, health, education, etc.: From that time to the end of the year, by private and public hearings, the inquiry was pushed vigorously despite obstructionist tactics practiced by Democratic members of the committee.

Among the more important facts revealed as a result of this investigation were the following: The existence of large bank deposits made by Democratic and Republican district leaders; the existence of gambling in district club houses; the payment of large fees to persons prominent in politics by corporation and individuals desirous of obtaining exemption from the operation of the city's zoning ordinance for pier leases, and the like.

A definite body of achievement resulted from the magistrates' court inquiry conducted by Mr. Samuel Seabury. In fact, the study of city affairs by the Legislature was an outgrowth of this original inquiry which dated back to September, 1930. Among the more important achievements of this earlier investigation were the following: The ousting of two magistrates and

the resignation of three others who feared to face charges; the imprisonment of five members of the police force because of vice squad revelations; the bringing of charges against 40 other members of the police force for the framing of women, impersonating superior officers, assault, or conspiracy; the bringing of disbarment proceedings against 15 lawyers because of alleged unethical practices; complete reorganization of the magistrates' courts and the abolition of the police department's vice squad. Incidental to the inquiry was the freeing of a large number of girls who were illegally held in Bedford Reformatory, as well as a general clean-up of the bail bond situation. It was interesting to note that the Hofstadter Committee revelations elicited small public interest, the general feeling being, apparently, that bad men in politics (to use Lincoln Steffens's phrase) had their distinct uses and were entitled to their wages of labor.

**COST OF RACKETEERING.** The New York State Crime Commission, in its final report to the legislature, estimated that racketeering was costing the country somewhere between \$12,000,000,000, and \$18,000,000,000, annually. The Commission pointed out that a single racket in New York State alone, that of fake securities, was known to total approximately \$400,000,000 a year. In making this estimate, the New York Commission supplied a group of figures which the National Commission on Law Observance and Enforcement had made no efforts to present in its study of the cost of crime in the United States (Report No 12). The Wickersham Commission had estimated that the United States was spending \$1,000,000,000 a year in the war on crime. Other costs as summarized by the New York *Herald Tribune's* Washington bureau were the following:

Federal criminal law administration . . . . .	\$ 52,786,000
State police . . . . .	2,660,000
State penal and correctional institutions	51,720,000
Criminal law administration in 300 cities	247,700,000
Private industrial police in Pennsylvania	1,260,000
Private protective service in large cities	10,000,000
Private watchmen . . . . .	159,000,000
Armored-car service . . . . .	3,900,000
Private correctional treatment of criminals . . . . .	850,000
Insured losses due to crime . . . . .	47,000,000
Mail frauds . . . . .	68,000,000
Insurance against crime . . . . .	106,000,000
Safes, chests, vaults . . . . .	4,227,000
Bullet-proof glass . . . . .	311,000
Known incendiarism . . . . .	2,000,000
Burglary of banks . . . . .	1,800,000
Thefts from jewelers . . . . .	2,000,000
Railroad freight thefts . . . . .	1,100,000
Forgeries . . . . .	40,000,000
Indirect cost through loss of productive labor . . . . .	322,000,000
<b>Total . . . . .</b>	<b>\$1,124,314,000</b>

**SUICIDE.** Dr. Frederick L. Hoffman estimated that the annual loss of life by suicide in the United States ran between 18,000 and 20,000. In 1930, the death rate per 100,000 population from suicide was 20 as compared with 18.1 in 1929 and 15.4 in 1920. Doctor Hoffman's figures were based on 100 American cities having in 1930 a total population of 32,000,000. The highest rates for 1930 were returned from Little Rock, Ark., with 65.9 per 100,000 population and Davenport, Iowa, with 51 per 100,000 population. The suicide rates for the five largest cities of the country in 1930 were as follows: New

York City, for Brooklyn, 13.7, for Manhattan and the Bronx, 27.4; Chicago, 18.9; Detroit, 16.3; Philadelphia, 17.6; Los Angeles, 24.8. Doctor Hoffman found that America's suicide rate was about midway between a low of 1.7 for Greece and a high of 32.7 for Austria. According to him, the increased rate in 1930 "reflects the nation-wide industrial and business depression which invariably results in numerous suicides, although, in the aggregate, this cannot form a very large proportion of the huge total. . . . Half of these [total suicides], I feel sure could have been prevented and I speak in the light of 40 years of an active interest in the subject of self-destruction, believing that if timely aid and qualified advice were forthcoming at the right time many a valuable life might be spared."

**STERILIZATION OF CRIMINALS.** The new Oklahoma law not only provided for the sterilization of mental defectives (thus joining the company of 15 other States) but also called for the sterilization of third-term criminals. This law, which it was claimed was not purposed to act as a punishment for the criminal but as a protection for society, was passed on the assumption that criminal tendencies were hereditary. Administration was placed in the hands of the State Board of Affairs, which also controlled all State hospitals and prisons. Provision was to be made for the creation of medical boards to pass first on criminals and insane persons subject to the laws; appeal to the courts was permitted. This Oklahoma law received considerable attention from the public press, the New York *Sun* pointing out, for example, that the new statute could be criticized on a number of counts. Thus, it said:

If it were an act of Congress, it certainly would be open to attack as violating the Eighth Amendment to the Federal Constitution. This amendment, forbidding cruel and unusual punishment, applies only to powers of Congress and Federal courts. The Oklahoma statute may come before the Supreme Court of the United States on either the "due process of law" or the "equal protection of the laws" provisions of the Fourteenth Amendment.

Valid or not, this method of dealing with criminals is likely to offend the sensibilities of a considerable portion of the public.

In some States, as in Iowa for example, the sterilization law had been used; in others, as in Indiana, it has been held unconstitutional; in a few States, notably California and Minnesota, it has been much employed and with public approval. The Wisconsin law applied to feeble-minded persons in State institutions and to others with certain inherited diseases. Previous issues of this YEAR BOOK have pointed out that the U. S. Supreme Court had found sterilization laws as applied to the feeble-minded constitutional, Mr. Justice Holmes in commenting on them having said: "Three generations of imbeciles are enough."

**A PROGRAMME FOR IMMEDIATE ACTION.** In an atmosphere of debate that was marked by considerable loose thinking and by heated utterance, Prof. Raymond Moley, of Columbia University, contributed a refreshing piece of advice. (In the New York *Times*, Aug. 30, 1931.) Pointing out that it was difficult to determine whether or not a crime wave actually existed and that it is doubtful whether automatic or apt solutions could be found to the continued existence of crime, Mr. Moley questioned whether it was possible to discover fundamental causes of crime

and move for their immediate eradication. A round-up of known criminals by harried police officers produced small results. The feverish activity of district attorneys was equally futile. "The underworld will be burned in effigy, so to speak. A few criminals will be tried and convicted with a flourish so that every gangster may know that New York is in the throes of the greatest crime clean-up in its history." Mr. Moley dismissed those "expansive remedies" which, while they may be logical, are immediately unattainable, and pointed out that there was at hand a group of remedies that offered promise of nearby and substantial relief. He was skeptical that the near future would reveal for us rules of thumb by which potential criminals in schools may be discovered and methods devised for turning them away from a life of crime. On this point, the professor declared: "We cannot successfully stop crime by detecting criminals in childhood because we cannot, on the basis of any present ascertained scientific knowledge, know who the potential criminals are. The 'prognostic index' is still a shimmering mirage."

Mr. Moley was wise enough, further, to deny that there existed any immediate hope for an end to the economic wars between employers and unions, leading to the use of gangs and gang warfare. Nor could we hope to look for a cessation on the part of the professional criminal of imitating the methods of business and business men. Finally, it was impossible to hope that politics and the activities of political parties were likely to terminate. As he said: "These are firmly based upon the irrepressible and never-ending tendency of people to gain special privileges for themselves."

The situation was, however, not altogether beyond repair. Among the proposals advocated by Mr. Moley, which were likely to bring relief, were the following: (1) Keeping money out of public places. In other words to substitute for the payroll in cash the general use of payment by check. (2) The more efficient prosecution of criminals and, when convictions are obtained, the employment of discriminatingly severe sentences. On this point Mr. Moley declared:

Prosecuting agencies and courts have their part to play. It consists of hard work and the appointment of assistants and judges because they are qualified for the job of law enforcement rather than for getting votes. This is the burnt offering that the courts and the district attorneys may contribute to the crime "war."

(3) The necessity for organized action by private agencies with private means. It is true that a certain amount of caution is necessary in the employment of this method and that it calls for leadership by wise and forbearing persons. Nevertheless, Mr. Moley believes that organized effort on the part of business to help the ferretting out and the prosecution of crime would be of incalculable assistance to the public law enforcement officers. (4) It is imperative that economic groups renunciate the use of gangsters. This relates both to business associations and unions.

It is high time that all organizations engaging in legitimate business publicly avow and privately adopt a declaration of independence so far as these enemies of society are concerned. This is not to say that capital and labor should be down together like lambs. But it is a suggestion that they deny themselves the luxury of gangster mercenaries who, in fact, constitute a menace to all law and order.

(5) A renunciation by all political groups of the use of police and other law enforcement agencies as the source of political gain. Mr. Moley refused to believe that there actually existed a working alliance between crime and politics. Nevertheless, the police of the country were being constantly hampered by the countless annoyances relating to small favors to which police chiefs were being subject. On this point, he declared: "With one law, one chief, one purpose, the police could be trusted to do vastly better. They are not intrinsically indolent or subservient. For the most part they are men of spirit, of character. To serve in such a non-political dispensation might work wonders." Mr. Moley concluded his stimulating statement with these words: "These measures suggest no mere Utopia. They constitute, in the present troubled state of the city, a minimum of effective action. Whether they are achieved rests upon the somewhat doubtful question of whether we are witnessing genuine indignation or mere excitement." See LAW, PROGRESS AND DEVELOPMENT; PROHIBITION; CHILD WELFARE; LYNCHINGS.

**CRITICISM.** See LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; ITALIAN LITERATURE, etc.

**CROATIA** (krō-ā'shā) **AND SLAVONIA.** A former crownland of the Austro-Hungarian Empire, extending from the Adriatic Sea to the Danube River; from Dec. 1, 1918, to Oct. 3, 1929, a Province of Yugoslavia. The administrative reorganization of Yugoslavia on the latter date eliminated Croatia and Slavonia as a governmental unit. On Jan. 31, 1921, its area was 16,920 square miles; the population, 2,739,593. The former capital, Zagreb, or Agram, had 150,000 inhabitants in 1928. See YUGOSLAVIA.

**CROPS.** See AGRICULTURE; and articles on various crops such as CORN, OATS, TOBACCO, WHEAT, ETC.; also paragraphs on Agriculture under various States.

**CROSS COUNTRY RUNNING.** Surprising all by his strength and speed Dan Dean, representing the University of Pennsylvania, won the Intercollegiate A.A.A.A. cross country championship at Van Cortlandt Park, New York City, in 1931. Over the 6-mile course the Pennsylvania runner was brilliant and defeated such stars as the defending champion, Clark Chamberlain, of Michigan State, Joe McCluskey of Fordham, and George Barker of New York University in 29:23.6. The following week Chamberlain went to Ypsilanti, Mich. to win the national A.A.U. title. Barker won the Metropolitan Intercollegiate test as well as the Metropolitan A.A.U. crown over the stiff Inwood Hill Park course. Harvard won the Intercollegiate team title, and Manhattan won the intercollegiate freshman title because of the fine triumph of Frank Crowley, who won the race in record time. Paul Kanaly of Boston captured the national junior championship, and Peter Taylor, of Millrose A. A., the Metropolitan junior title. The University of Indiana team won team laurels in the Western Conference as well as in the national senior meet at Ypsilanti.

**CROWELL, JOHN FRANKLIN.** An American economist, died in East Orange, N. J., Aug. 6, 1931. He was born in York, Pa., Nov. 1, 1857, and was graduated from Yale University in 1883 and with the Ph.D. degree from Columbia University in 1897. After acting as principal of the Schuylkill Seminary in Fredericksburg, Pa., for

several years, he became president of Trinity College, Durham, N. C. (later Duke University), serving from 1887 to 1894. He was then appointed head of the department of economics and sociology at Smith College, where he remained until 1897. In 1900 he became associated with the U. S. Treasury Department as an expert agent of the Industrial Commission and also as an expert on internal commerce for the Bureau of Statistics. He was an editorial writer for the *Wall Street Journal* in New York City from 1906 to 1915, and during the World War period was successively executive officer of the Chamber of Commerce of the State of New York, economist and financial statistician in the Internal Revenue Office in Washington, research director in government war contracts for the Carnegie Endowment for International Peace, and director of the World Market Institute in New York City, retiring from the latter position in 1921. He was also president of the American Civic Alliance from 1910 to 1913. Among his publications are *Taxation in the American Colonies* (1893); *The Logical Process of Social Development* (1898); *Internal Commerce of the United States* (1902); *Report to War Department on Deepening the Mississippi River* (1903); *Trusts and Competition* (1915); *Social Insurance with Special Reference to Compulsory Health Insurance* (1917); and *Government War Contracts* (1920).

**CRUISER, NAVAL.** See NAVAL PROGRESS.

**CRYSTALS, CRYSTALLIZATION, CRYSTALLOGRAPHY.** See MINERALOGY.

**CUBA.** A republic of the West Indies consisting of the large island of the same name, the Isle of Pines, and small adjacent islands. Capital, Havana (Habana).

**AREA AND POPULATION.** The area is 44,164 square miles of which 41,634 are for the island of Cuba, 1180 for the Isle of Pines, and 2350 for the other islands. The population census taken September-November, 1931, showed a total of 3,544,921 inhabitants (provisional figure), compared with 2,889,004 at the previous census of 1919. The population was distributed among the several Provinces as follows:

POPULATION OF CUBA, BY PROVINCES

Province	Area, in square miles	1919 census	1931 census*
Pinar del Rio . . . . .	5,206	261,198	320,922
Havana . . . . .	3,170	697,583	986,336
Matanzas . . . . .	3,256	312,704	335,880
Santa Clara . . . . .	8,257	657,697	753,602
Camaguey . . . . .	10,064	228,913	362,175
Oriente . . . . .	14,211	730,909	786,006
Total . . . . .	44,164	2,889,004	3,554,921

\* Preliminary figure.

In 1931, the economic depression in Cuba reversed the normal surplus of immigration over emigration; in the first half of the year 69,736 passengers left the island while only 49,987 entered. Immigration from Spain, the chief source, declined steadily from 94,294 in 1924 to 4242 in 1930; in 1931 about 5000 indigent Spaniards were returned to their native land. Haitians entering Cuba in 1930 numbered 5126, but many of these returned to Haiti. Total immigration in 1929 was 17,179; in 1928, 27,314. The Government announced that its infant mortality rate of less than 1 per cent for 1930 was the lowest of any country in the world. Total births in 1929 numbered 60,441; deaths, 42,160. The

chief towns, with their estimated populations in 1930 are: Havana, 589,079; Santiago de Cuba, 144,975; Camaguey, 48,773; Matanzas, 46,717; Cienfuegos, 39,940; Marianao, 32,285; Cárdenas, 29,304.

**EDUCATION.** Education is free and compulsory and the percentage of literacy for persons over 10 years of age was raised from 62 in 1919 to about 80 in 1929. During the year ended June 30, 1930, there were 7375 public elementary schools, with 242,413 pupils; 84 night schools for working people, with 8377 pupils; 525 private schools, with 31,949 pupils, and a number of traveling schools, with 3458 pupils. Enrollment in the University of Havana in 1929-30 was 4795.

**PRODUCTION.** Cuba is primarily an agricultural country, in which sugar, the principal crop, dominates the economic situation. Sugar and its by-products normally comprised about 80 per cent of the value of all exports, while tobacco and its products accounted for 12 per cent. Cacao, cereals, coffee, potatoes, coconuts, and fruits are other leading products. As a result of the progressive decline in sugar prices, Cuba in 1931 underwent its seventh and most critical year of economic depression. As a result a major readjustment of the Cuban economic system was taking place, tending toward the development of other local industries. There were numerous business failures, hoarding of capital developed, governmental revenues steadily declined, and the Government was forced to initiate further drastic economies. Bank failures, widespread salary reductions, foreclosure sales, labor difficulties, and political disorders contributed to the depression.

The decline of the Cuban sugar industry is graphically illustrated by the accompanying table from the 1931 *Commerce Yearbook*.

CUBAN SUGAR PRODUCTION

Year	Mills grinding Number	Sugar production 1,000 long tons	Average price per pound Cents	Total value \$1,000
1921-22 to 1925-26, average . . . . .	182	4,383	3 26	308,424
1926-27 . . . . .	177	4,509	2 64	266,621
1927-28 . . . . .	172	4,038	2 20	198,984
1928-29 . . . . .	163	5,156	1 72	198,661
1929-30 . . . . .	157	4,671	1 41	147,536
1930-31 (estimated) . . . . .	...	3,122	1 12	78,324

The share received by Cuban planters and agricultural employees from foreign sales of sugar shrank from \$235,378,000 in 1924 to about \$38,151,000 in 1931. The effect was a sharp reduction in the purchasing power of a large section of the population. Exports of raw and refined sugar amounted to 7,197,000,000 pounds, valued at \$105,203,000, in 1930, as compared with 10,933,000,000 pounds, valued at \$204,840,000, in the previous year.

See AGRICULTURE under *World Agriculture*.

Passage of the Chadbourne sugar stabilization law toward the end of 1930 caused prices to strengthen somewhat. It provided for the segregation of 1,500,000 tons of sugar to be marketed over five years by the state-created National Sugar Export Corporation. A bond issue of \$42,000,000 was provided for to pay for the segregated sugar at the rate of \$4 per bag of 325 pounds. The production of molasses was 211,107,505 gallons in 1930, compared with 204,733,388

gallons in 1929. The 1930 tobacco crop amounted to about 82,117,000 pounds, compared with 65,398,000 pounds in 1929, and exports of tobacco shrank in value from \$37,879,000 in 1929 to \$33,541,000 (preliminary). The catch of the fisheries in 1930 was valued at \$1,442,949 (\$4,197,772 in 1929). The forests contain valuable cabinet woods.

Livestock in 1930 included 2,543,000 cattle, 591,000 swine, 135,000 sheep and goats, and 95,000 mules and asses. Mining is relatively unimportant, but iron, copper, chrome, and manganese ores are produced for export and some coal and petroleum are produced for local consumption. The large-scale reduction of low-grade manganese ores in Oriente Province was undertaken by an American firm in 1931, utilizing a newly developed process. Manufacturing is confined chiefly to the grinding of sugar and the making of tobacco products. Due to tariff protection and other forms of Government encouragement, there was a fairly rapid development after 1925 in the dairy and canning industries, and in the manufacture of clothing and footwear, furniture, textiles, paint, paper, glass, and cement. Unemployment increased during 1930 and 1931; wages for agricultural labor declined to 40 cents a day in 1930.

American direct investments in Cuba in 1930 were estimated by the U. S. Bureau of Foreign and Domestic Commerce at \$981,957,000, excluding government loans. Of this total \$544,012,000 was invested in the sugar industry and \$116,726,000 in railways.

COMMERCE. The value of Cuban general imports and exports in 1930 was \$162,452,000 and \$167,411,000, respectively, as compared with \$216,215,000 and \$272,440,000, respectively, in 1929. Exports had registered a steady decline since 1924, when they were valued at \$421,075,000; imports had declined since 1925, when they totaled \$297,324,000. The 1930 surplus of exports over imports was \$4,959,000, as against \$56,225,000 in 1929. According to Cuban statistics, exports to the United States, which had reached \$208,754,000 in 1929, declined in 1930 to \$116,074,000, of which \$73,963,000 were accounted for by raw and refined sugar. Exports to the United States constituted 69 per cent of the total as compared with 77 per cent in 1929. Imports from the United States during 1930 amounted to \$91,872,000, a decline of 28 per cent from the 1929 figure. Foodstuffs and finished manufactures continued to constitute the bulk of the trade. The United States supplied 56.5 per cent of total Cuban imports in 1930, as compared with 59 per cent in 1929. Cuba ranked third as a world market for American textile products, excluding raw cotton, in both 1929 and 1930.

The United Kingdom in 1930 supplied 5.5 per cent of Cuba's general imports (5.6 in 1929) and purchased 15.2 per cent of Cuban exports (12.6 per cent in 1929). Spain and France were the other leading participants in the Cuban trade. The principal exports, in order of value, were sugar, tobacco, molasses, cigars, copper ore, cattle hides, bananas, and pineapples. Leading imports were cotton manufactures, rice, machinery and accessories, iron and steel, vegetables, lard and substitutes, meats, wheat flour, and sugar bags. The balance of international payments is notably affected by the expenditures of American tourists in Cuba. For the

five-year period 1926 to 1930 inclusive, an average of 75,785 Americans visited the island annually.

FINANCE. Preliminary returns for the fiscal year ended June 30, 1930, showed regular budgetary revenues and expenditures of \$77,157,087 and \$81,112,733, respectively, as compared with the original budget estimates of \$85,450,000 and \$85,392,162, respectively. The public-works fund preliminary returns for the same year showed revenues and expenditures totaling \$18,121,289 and \$20,685,712, respectively. Special fund receipts were \$9,856,205, while charges against these funds aggregated \$16,096,070. The ordinary budget for 1930-31, as passed in June, 1930, authorized expenditures of \$76,754,617. Despite subsequent reductions in line with the progressive decline in revenues, the year ended with a deficit of about \$11,000,000. The 1931-32 budget, as promulgated by the President June 30, 1931, estimated ordinary revenues at \$60,385,000 and expenditures at \$60,381,400. Declining revenues again forced a reduction of expenditures, amounting to \$6,692,814, effective Oct. 1, 1931. It was authoritatively stated that additional heavy reductions would be required to balance the budget.

According to the President's message of Apr. 6, 1931, the public debt on Feb. 28, 1931, totaled \$171,626,000. This figure did not include the floating debt nor the potential indebtedness arising out of issuance of obligations under the Chadbourn sugar stabilization plan. Some estimates placed the total public debt as high as \$255,000,000. The funded debt on Feb. 28, 1930, consisted of \$8,964,000 of internal loans and \$71,554,000 of external loans, floated in New York. In addition there was in 1931 a debt of about \$100,000,000 in the form of short term "public-works serial certificates," held mostly by great New York banks. Despite great financial stringency, the Cuban Government made regular interest and amortization payments on the foreign debt up to Dec. 31, 1931.

COMMUNICATIONS. For the fiscal year 1929-30, there were 3064 miles of railway line in operation, all in private hands, which carried 16,305,000 passengers (17,531,000 in 1928-29) and 28,019,000 long tons of freight (30,481,000). Gross receipts for the year were \$30,438,000, compared with \$38,040,000 in 1928-29. The Central Highway of Cuba, traversing the island from Pinar del Rio on the west to Santiago on the east coast, was formally opened Feb. 24, 1931. The highway is 706 miles long and was built in four years at a total cost of \$101,123,000. At the beginning of 1931, there were 1990 miles of highways, of which 1323 miles were macadam. In 1929, 6453 vessels of 14,187,000 net registered tons entered the ports and 6445 of 14,192,000 tons cleared. The telegraph system, with 13,598 miles of wire, is government owned and operated, but the telephone system, with 255,140 miles of wire, is owned by a private company.

GOVERNMENT. The Constitution, as amended May 11, 1928, vests executive power in a president, elected for six years and ineligible for reelection; legislative power rests in a national congress of two houses, the Senate of 37 members elected for nine years and the Chamber of Representatives of 128 members, elected for six years. The Senate is renewed in part and the House is renewed by halves every three years. President in 1931, Gen. Gerardo Machado y

Morales (Liberal), who was inaugurated May 20, 1929, for a second term expiring May 20, 1935. The three parties represented in Congress had analogous programmes and fully supported the Machado Government. The Coalition Cabinet, including representatives of all three parties, was reorganized Dec. 5, 1930.

### HISTORY

**FAILURE OF THE REVOLT.** The long-smoldering political discontent in Cuba flamed into open revolt against the semi-dictatorship of President Machado early in August, 1931, only to be crushed effectively before the expiration of the month. The seriousness of the uprising became evident on August 9, when martial law was declared in the Provinces of Havana and Pinar del Rio and 17 prominent Cubans were arrested. The following day came the first skirmish between government troops and insurgents in Havana Province. Under emergency legislation rushed through Congress, the President immediately proclaimed a state of siege throughout the island; a severe censorship was placed on the press.

Several thousand men were reported to have rallied to former President Mario G. Menocal, who raised the standard of revolt. In the first four days following the declaration of martial law, rebel and government forces met in 22 armed clashes, in which the casualties were placed at 36 dead and 53 wounded. On August 13 Congress adjourned its sessions, all reserves were called to the government colors, and General Machado himself went to the front to direct operations. As predicted, the insurgents proved no match for Cuba's well-trained and disciplined army of some 12,000 men. The two leaders of the rebellion, former President Menocal and Col. Carlos Mendieta, were defeated and captured with a group of insurgents in Pinar del Rio Province on August 14. Heavy fighting continued in Santa Clara and Pinar del Rio Provinces, it was reported, until August 19, when the defeat of a filibustering expedition at the small port of Jibara broke the morale of the insurgents.

The Jibara expedition consisted of a small number of insurgents who landed 70 machine guns, 2500 rifles, and 2,500,000 rounds of ammunition to supply rebels in the interior. The arms were said to have been shipped from the United States, where headquarters of a revolutionary junta had been established in New York City and where on August 5 and 7, two groups of alleged insurrectionists were arrested by United States officials when about to embark for Cuba. Before the arms landed at Jibara could be moved, about 150 rebels guarding them were attacked by government land and air forces numbering between 600 and 700. The rebels were routed after a three-day engagement, in which about 13 were killed and 24 wounded. Sporadic fighting continued at various points until the end of the month, but on August 31, Dr. Mendez Penate, the last insurgent chieftain in the field, surrendered. It was officially stated August 27 that some 2000 political prisoners were held in Cuban jails.

**BACKGROUND OF THE REVOLT.** The political opposition to President Machado had assumed menacing proportions during 1930 (see 1930 YEAR BOOK). It was based primarily on the contention of his opponents that the constitutional

amendments of 1928, and consequently Machado's second term in the Presidency, were illegal. By vigorous suppression of opposition activities and the support of the army, the President was able to resist the demands for his resignation. The situation in Cuba at the beginning of 1931 was described by a correspondent of the *New York Times* as follows:

Martial law has been declared; public meetings have been suppressed, a censorship has been imposed and newspapers have been silenced; scores of the government's critics have been imprisoned; fatal riots have occurred in many parts of the island, and soldiers have charged the citizenry even on the magnificent Prado in the heart of Havana.

Political unrest was aggravated by the economic depression and the Government maintained these repressive measures in effect throughout most of 1931, with some relaxation of their severity following the failure of the August revolt. During January, the "unbearable" state of unrest and disorder caused President Machado to suspend publication of several Havana newspapers, including the *Havana American*, whose owner, John T. Wilford, an American citizen, was deported on January 15. A number of students in Havana University were arrested and a commission for the suppression of anti-Machado agitation was appointed by the President. Meanwhile bomb explosions, which had become common in 1930, continued with alarming frequency and fires of alleged incendiary origin destroyed large fields of sugar cane.

Virtually dictatorial powers to deal with public disorder were conferred upon the President by Act of Congress on February 5. Another bill, which had the effect of stifling the opposition, was passed by Congress February 10. It created the city of Havana a Federal district, with officers subject to appointment by the President. On February 23 a bomb was discovered on the roof of the Presidential palace; a private in the Cuban Army was subsequently sentenced to death by court-martial for this crime. A vigorous drive against terrorists and alleged Communists resulted in the discovery of several large deposits of bombs and other weapons.

Negotiations for a political truce, first offered by President Machado on March 28, were continued throughout April. Although approved in principle by the House of Representatives on April 22, the President's offer was rejected by his opponents April 23 on the ground that the Government had avoided or postponed action on all specific proposals for reform. The demands advanced by the opposition included: (1) Revision of the Constitution and restoration of the original provisions of May 20, 1922; (2) a new electoral census; (3) reorganization of the three government parties; (4) extension of the suffrage to women previous to the 1932 elections; (5) constitutional limitations on the terms of Congressmen elected on Nov. 1, 1930; and (6) new Presidential elections in November, 1932, at which Senators, Representatives and Mayors would also be chosen.

On May 4 and again on May 15, the Cuban Supreme Court made two rulings adverse to President Machado, without visible effect upon his régime. One declared unconstitutional the modification of the Constitution in 1928, which resulted in the extension of the President's term of office; the other ruled that his suspension of various normal schools and newspapers was

unconstitutional. In the same month (May 2) Maj. Arsenio Ortiz, former military supervisor of Oriente Province, was declared guilty of six political assassinations. In June, President Machado offered new concessions to his opponents, including extensive constitutional reform, but his offer was again rejected by the opposition, though provisionally accepted by the House of Representatives July 21. Apparently, the opposition had determined upon revolution as the only practicable means of ending General Machado's rule. It was estimated that more than \$1,000,000 was expended on the unsuccessful revolt which followed in August. The interval previous to the August rising was marked by the killing of Senator Rogerio Zayas Bazán of Camagüey Province in a political duel with Senator Modesto Maidique of the same Province on July 14. Suspicion that Senator Bazán had been killed by treachery during the course of the duel caused the Senate on July 21 to remove Senator Maidique's Parliamentary immunity. The latter escaped arrest by fleeing to Honduras.

**AFTERMATH OF THE INSURRECTION.** With the crushing of the revolt, President Machado on September 8 renewed his proposals for constitutional reform and they were once more approved by the House of Representatives nine days later. They included elections in 1932, retirement of President Machado in 1933 instead of in 1935, and the immediate appointment of a Vice President by the Supreme Court. Once more the opposition elements, through Dr. Cosme de la Torre, then in Washington, declared Machado's proposals unsatisfactory (September 22). Dr. de la Torre declared they were primarily intended to hoodwink public opinion in the United States, where Machado was contemplating the raising of new loans. The Cuban Senate on October 22 sidetracked the reform measures indefinitely, in order to discuss new economy proposals submitted by the President. Coincidentally, there was a renewal of terroristic activities; 10 bombs exploded in Havana between October 2 and October 24.

In the middle of November a contraband shipment of arms was seized off Havana harbor and other events indicated the continuance of unrest. Conditions were more stable than before the revolt, however, and the Government proceeded to gradually release some of the leaders and other participants in the August rebellion, upon pledges to abstain from further subversive activity. A new effort at compromise between the Government and its opponents was made with the arrival in Havana on November 30 of Dr. de la Torre. Other Opposition leaders repudiated the latter's right to speak for the revolutionary junta, still in existence in the United States. On December 22, however, President Machado ended the efforts toward a peaceful settlement by announcing that he would serve out his full term of office, ending in 1935.

**COMMUNISM IN CUBA.** President Machado and other government officials made repeated charges during the year that the numerous bombings and other terroristic activities were the acts of Communists and many prominent Cubans were arrested on charges of Communist activities. Following an attempt to blow up the Havana waterworks on Jan. 20, 1931, President Machado issued a manifesto attributing this and other conspiracies to a plot of the Third Inter-

national at Moscow to strike indirectly at the United States through organizing a Communist revolution in Cuba. Subsequently (February 11) Congress granted the President full powers to eradicate Communism in Cuba. The arrest, imprisonment, or deportation of alleged Communists continued throughout the remainder of the year.

**ECONOMIC DEVELOPMENTS.** In addition to its efforts to balance the budget by a drastic reduction of expenditures, the Government put into effect February 2, a newly enacted emergency economic law raising both taxes and Cuba's tariff wall to new high levels. The tariff and tax laws aroused much opposition among Cuban business men. On April 14, the Government announced that it had engaged Prof. Edwin R. A. Seligman of Columbia University to serve as its economic adviser. Strong opposition to the restriction of sugar production under the Chadbourne sugar stabilization law arose among sugar planters during the year. Fifteen hundred members of the National Association of Cane Planters, meeting at Santa Clara November 26, voted to work for the cancellation of the international sugar agreement.

**CUBAN-AMERICAN RELATIONS.** The United States Government, so far as could be ascertained, maintained a strict neutrality in both the political and armed struggle between the Cuban Government and its opponents during 1931. Secretary of State Stimson on Oct. 3, 1930, had stated that the Hoover Administration's policy was not to intervene in Cuba under the Platt Amendment except in case of virtual anarchy. This policy was reiterated by Assistant Secretary of State Castle on August 10, following the outbreak of the Cuban revolt. The Platt Amendment, and American policy in relation to it, however, again came in for severe criticism from both Cuban factions. Dr. Fernando Ortiz, Cuban editor and vice president of the rebel junta in New York City, was quoted by the *New York Times* of Nov. 8, 1931, as saying that the Platt Amendment since 1917 had served to maintain in power usurpatory governments, against the popular will.

President Machado, in a speech on October 28, attributed 80 per cent of Cuba's economic ills to the American tariff. His lead was followed by numerous Cuban politicians and newspapers, criticism of the American tariff policy centring upon the fact that the Cuban-American reciprocity treaty prevented Cuba from concluding advantageous commercial treaties with Great Britain and other nations. On November 4, President Machado reversed his statement, asserting that the U. S. tariff could no more be blamed for Cuba's plight than could the tariffs of other countries. He added, however, that "if no tariff barrier separated us from the American market, with its almost unlimited possibilities for consumption of our products, there would never have been any semblance of a crisis in Cuba." The so-called "Planet plan" of the Chilean Government for a Congress of the Latin-American states to permit of close collaboration in the face of the economic depression was favorably received in Cuban governmental circles and the Secretary of State was instructed (about June 25) to arrange for Cuba's participation. The plan later collapsed (see *CHILE* under *History*).

*tion and Our Treaty Relations* (The Brookings Institution, 1931).

**CUBRA** (KUFRA). See CYRENAICA.

**CULTURE, DEVELOPMENT OF.** See ANTHROPOLOGY; PHILOLOGY, MODERN.

**CUMBERLAND PRESBYTERIAN CHURCH.** A branch of the Presbyterian Church, originally the Cumberland Presbytery of Kentucky. It was formed in 1810, when the so-called anti-revival party of the church objected to the admission into the ministry of men, who were not up to the usual literary and theological standards, and to the doctrine of fatality as taught in the third and tenth chapters of the Westminster Confession of Faith. Its chief strength was in the Southern States, in consequence of which it was barely saved from disunion during the slavery dispute at the time of the Civil War. This situation led to the establishment of the Colored Cumberland Presbyterian Church. A general assembly which meets annually is the supreme judiciary. In 1931 the denomination comprised 10 synods and 61 presbyteries, and there were 1160 churches, reporting 736 ministers, and a church membership of 68,099. The Sunday-school enrollment was approximately 52,250. The property of the church was valued at \$3,411,802, not including \$500,000 endowment for education.

Missionary work was carried on among the Indians in the United States, and churches were maintained in China, where there was an organized presbytery in Canton with nine churches in South China. During the year mission work was opened up in South America. The denomination carried on educational work under the direction of the board of education and maintained Bethel College and the Cumberland Presbyterian Theological Seminary, both in McKenzie, Tenn. *The Cumberland Presbyterian*, published in Nashville, Tenn., is the official organ of the church. The 1931 national meeting was held in Evansville, Ind., May 21-27, and the 1932 meeting was announced for May 19-24 in Chattanooga, Tenn. The Rev. J. L. Elliott of Denton, Tex., was moderator of the general assembly, and the Rev. D. W. Fooks of Paducah, Ky., was stated clerk and treasurer.

**CURAÇAO**, koo'ra-sā'ō. A Dutch colony in the West Indies consisting of two groups of islands about 500 miles apart, one of them comprising the islands of Curaçao, Bonaire, and Aruba, and the other consisting of the southern part of St. Martin (the northern part belongs to France), St. Eustatius, and Saba. Area, 403 square miles; population, Dec. 31, 1929, 67,722, of whom 44,344 were on the island of Curaçao. The capital is Willemstad, on the island of Curaçao, with a population of 20,792. Registered births in 1929 numbered 2401; deaths, 1084; marriages, 724. In the same year there were 38 schools, with 9552 pupils. The chief products of the colony are maize, beans, pulse, cattle, salt, and phosphate of lime. The chief industry is the refining of crude oil imported from Venezuela and Mexico. Imports in 1929 were valued at 361,355,450 guilders and exports at 308,667,378 guilders (1 guilder exchanged at about \$0.40 in 1929). Vessels entering the ports in 1929 numbered 12,092, of 45,181,573 net registered tons. The revenue for 1930 was estimated at 7,385,325 guilders and the expenditures at 6,555,853 guilders. Authority to connect by cable the islands of Curaçao, Aruba, and Bonaire with each other, with the mainland, and also

with the All America Cables system was granted by the Netherlands Government in 1930. The colony is administered by a governor assisted by a council of four and a colonial council of 13 members, all nominated by the sovereign. Governor in 1931, Major B. W. T. van Slobbe (appointed Jan. 1, 1930). See NETHERLANDS, THE.

**CURLING.** Canada remained supreme in curling during 1931, winning the most important fixture of the season, the Gordon International Medal competition at Montreal in February. After twenty-one games the defending champions led the United States, 305 to 278, and kept the medal. The Caledonians of New York captured the Gordon National medal by downing Schenectady in the finals at Schenectady in March by 19 to 10.

**CURRENCY.** See COINS, VALUE OF FOREIGN; FINANCIAL REVIEW; MONEY; UNITED STATES.

**CURRICULUM.** See EDUCATION IN THE UNITED STATES; UNIVERSITIES AND COLLEGES.

**CURTISITE.** See MINERALOGY.

**CUSTOMS UNION, AUSTRO-GERMAN.** See under AUSTRIA, GERMANY, and FRANCE under *History*.

**CYCLING.** A new amateur bicycle sprint champion was crowned in 1931 when Arthur Rose, of the Acme Wheelmen, won the title after only one year's campaign with the fastest in the game. Rose died in the early part of December of pneumonia. Cecil Walker, that sturdy Australian, was the outstanding star in the professional ranks, carrying off the national professional sprint championship for the second year in a row and winning the national all-around title for the seventh consecutive time. The national professional motor-paced championship went to Charley Jaeger of Newark in a terrific duel with Franco Georgetti of Italy who had ruled for four seasons. After the regular series of 36 championship races the two men were tied for honors and Georgetti lost in a stirring finish.

The young French cyclists—Marcel Guimbretiere and Alfred Letourner—were the leaders in six-day racing. This pair won both the March and December races at Madison Square Garden, New York City, and finished second in both Chicago events. William Grimm of Newark, and Emil Richilli of Switzerland won the February Chicago race and Grimm teamed with Franz Deulberg of Germany to take the November event at Chicago.

Falck Hansen of Denmark won the world's professional sprint crown, dethroning Lucien Michard of France, who had held the title for four years. Helge Harder of Denmark won the world's amateur sprint crown and the world's motor-paced championship went to Walter Sawall of Germany while Learco Guerra of Italy captured the world's professional road title.

**CYPRUS**, si'prūs. Cyprus was ceded to Great Britain for administrative purposes by Turkey in 1878, formally annexed by Britain on Nov. 5, 1914, and given the status of a British colony May 1, 1925. Third in size among the islands of the Mediterranean, it is situated 40 miles south of the Anatolian peninsula and 60 miles west of the Syrian coast. The area is 3584 square miles and the population at the census of 1921 was 310,715, including 61,339 Moslems; the census population in 1931 totaled 347,959. Capital and chief trading centre, Nicosia (population 23,677 in 1931). The 1931 census showed 276,572 adherents of the Greek-Orthodox Church, 64,238

Moslems, 1058 Anglicans and Protestants, and 5932 Christians of other sects. In 1929, elementary schools numbered 982, with a total enrollment of 49,070.

About 65 per cent of the population are engaged in agriculture, the chief products being beans, potatoes, raisins, barley, wheat, vetches, oats, cotton, sesame, olives, and silk. The mining of copper ore, asbestos, gypsum, terra umbra, and chrome is extensively carried on. Industry is relatively unimportant. Imports in 1930 were valued at £1,419,990 (£1,983,833 in 1929) and exports at £1,217,727 (£1,635,730). A total of 527 foreign vessels of 997,075 tons entered the ports in 1929. Exclusive of the grant-in-aid from Great Britain and the island's share of the Turkish debt charge, revenue and expenditure in 1929 were £757,117 and £717,342, respectively. In 1930, a budget deficit was indicated for the first time since 1926. The public debt at the end of 1929 totaled £160,738. There were (1930) 881 miles of macadam highways and 2039 miles of graded or drained dirt roads. A weekly air service links the island to Alexandria, Egypt, and Haifa, Palestine. Cyprus is administered by a governor, aided by an executive council and a legislative council of 24 members, of whom nine are office-holders and the remainder are elected for five years, 12 of them by non-Moslem and three by Moslem voters. Governor in 1931, Sir Ronald Storrs. See *ARCHAEOLOGY*.

**HISTORY.** The agitation of the Greek majority in Cyprus for union with Greece culminated on Oct. 22, 1931, in fierce rioting in Nicosia and the other chief towns, the destruction of the Governor's residence, and the forced evacuation of British nationals. The immediate cause of the outbreak was an imperial order-in-council putting into effect a revision of the tariff, which the Legislative Council had previously rejected. Despite the arrival of British troops by airplane and naval vessels from Egypt, riots and raids on government properties continued into November. The British Secretary of State for Dominions and Colonies on October 29 gave the Governor a free hand to quell the disorders, in which four civilians were killed and 31 civilians and 35 policemen and soldiers wounded. The rioting subsided following numerous arrests and the banishment of ten ringleaders from the island. See *GREECE* under *History*.

**CYRENAICA**, sir'ē-nā'y-ka. The eastern district of the Italian colony of Libia on the north African coast. Area, about 75,340 square miles, exclusive of the Cufra hinterland zone of about 285,640 square miles. The population (1929 census) was 149,000 (135,000 Moslems, 10,000 Europeans, 4000 Jews); capital and chief town, Benghazi, with 33,794 inhabitants in December, 1929. Agriculture, fishing, cattle raising and salt refining are leading industries. Italian colonization is progressing. Imports in 1930 totaled 151,652,000 lire; exports, 21,249,000 lire (1 lira equals \$0.0526 at par). The estimated revenue for 1930-31 was 248,580,000 lire, including an Italian State contribution of 204,700,000 lire; civil expenditure, 96,905,000 lire; military expenditure, 150,980,000 lire. The military force in 1929 comprised 500 officers and 16,000 men. Governor in 1931, Marshal Pietro Badoglio, whose headquarters were in Tripolitania; Lieutenant Governor of Cyrenaica, Gen. Graziani. See *TRIPOLITANIA*.

The Italian campaign against the rebel

Senussites was pushed to a successful conclusion during 1931. Cufra was captured on January 24 and in September the Senussite leader, Omar el Mukhtar, was captured and executed. The forced migration of 80,000 natives from the disturbed interior to the coast in 1930 had deprived the insurgents of their means of support.

**CZECHOSLOVAKIA**, chēko-slo-vā'kia. A central European republic, formed Oct. 28, 1918, out of the Slav regions of the old Austro-Hungarian Empire; comprising the former Austro-Hungarian provinces of Bohemia, Moravia, Silesia, Slovakia, and Ruthenia, together with the portion of the Teschen district assigned to Czechoslovakia at the Ambassadors' Conference July 28, 1920. Capital, Praha (Prague).

**AREA AND POPULATION.** The total area of Czechoslovakia is 54,196 square miles. The population at the censuses of 1921 and 1930 was distributed by Provinces as follows:

**CZECHOSLOVAK POPULATION, BY PROVINCES**

Province	Area, sq. miles	Population	
		1921	1930
Bohemia .....	20,102	6,670,610	7,106,766
Moravia * .....	8,615	2,662,856	2,825,137
Silesia * .....	1,719	676,121	738,020
Slovakia .....	18,882	2,998,244	3,330,885
Ruthenia .....	4,877	604,593	725,350
Total .....	54,196	13,612,424	14,726,158

\* Moravia and Silesia were united under one administration Dec. 1, 1928.

By race, the population was distributed in 1921 as follows: Czechoslovaks, 8,760,937 (65.5 per cent); Germans, 3,123,568 (23.3 per cent); Magyars, 745,431 (5.5 per cent); Ruthenians, 461,849 (3.4 per cent); Jews, 180,855 (1.3 per cent); Poles, 75,853 (0.5 per cent); others, 25,871 (0.2 per cent). There were also 238,808 aliens. The largest cities, with their population at the 1930 and 1921 censuses (1921 figures in parentheses), are: Praha (Prague), 848,081 (676,663); Brno (Brünn), 263,646 (221,758); Moravská Ostrava, 125,347 (113,709); Bratislava (Pressburg), 123,852 (93,189); Plzeň (Pilsen), 114,150 (108,023). The majority of the people are Roman Catholics, who numbered 10,383,833 in 1921. Czech is the official language, but about 25 per cent of the population speak German as their native tongue. For the period 1926 through 1930, births averaged 336,918 annually and deaths 221,218, the annual excess of births being 115,700. For the same period, emigration averaged 26,138 annually, with 12,961 going overseas.

**EDUCATION.** School attendance is compulsory between the ages of 6 and 14 and the population is 93 per cent literate. For the 1929-30 school year, there were 1,839,312 pupils in primary schools, 88,412 in secondary schools, and 31,164 in advanced technical schools and universities. There are a German and a Czech university at Praha (Prague), a Czech university at Brno (Brünn), and a Slovak university at Bratislava (Pressburg).

**PRODUCTION.** Czechoslovakia inherited about three-fourths of the industrial resources of the former Austro-Hungarian Empire and the north-western section is one of the most highly developed industrial districts of Europe. In addition, the nation is self-contained in most agricultural commodities, although considerable quantities of livestock, wheat, corn, and lard are

imported. Of the total population, about 45 per cent are engaged in industry and commerce and 40 per cent in agriculture. In 1929, there were 15,205,000 acres of arable land, or 43.8 per cent of the total area, 5,850,000 acres of permanent meadow and pasture, and 11,496,000 acres of forests. The area and production of the chief crops in 1929 and 1930 are shown in the accompanying table from the 1931 *Commerce Yearbook*.

CZECHOSLOVAK CROPS: AREA AND PRODUCTION

Crop	Area (thousands of acres)		Production *	
	1929	1930	1929	1930
Wheat .....	2,017	2,112	52,902	53,077

\* Unit, metric ton.

<sup>b</sup> Seasons ended following year.

\* Unit, pound.

\* Unit, gallon of wine.

\* Thousands of units—bushels except as indicated.

The unfavorable crops of 1930 were followed by a still more unfavorable harvest in 1931. According to preliminary estimates the 1931 wheat crop was 24 per cent less than in 1930, rye 28 per cent less, barley 19 per cent less, oats 8 per cent, and corn 10 per cent. The 1931 sugar beet crop was fairly good but the sugar content was 4 per cent less than in 1930. Agricultural prices also declined steadily during 1930 and 1931, greatly reducing the purchasing power of the farming population. The census of 1930 showed 4,547,000 cattle, 3,088,000 swine, 831,000 sheep, 1,080,000 goats, and 750,000 horses.

Production of the principal minerals and basic manufactures in 1930 (1929 in parentheses), in metric tons, was: Coal, 14,572,000 (16,751,000); lignite, 19,256,000 (22,555,000); coke (from coal), 2,711,000 (3,160,000); iron ore, 1,668,000 (1,808,000); pig iron, 1,435,000 (1,645,000); steel ingots and castings, 1,835,000 (2,193,000); manganese ore, 85,220 (96,530); salt, 186,488 (173,989). Beer production in 1930 was 295,553,000 gallons (299,701,000 in 1929); artificial silk, 3,200,000 pounds (4,250,000); raw cotton consumption, 217,261,000 pounds (238,987,000). Industrial conditions became increasingly difficult during 1930 and 1931, due partly to difficulty in collecting payments for exports to neighboring countries. Unemployment continued to increase, reaching a total of 253,580 at the end of October, 1931. Tax returns for 1929 showed only 7237 persons with incomes of more than \$4500 a year and 302 persons with an annual income exceeding \$30,000.

COMMERCE. The trade balance in 1930 was again favorable, with exports valued at \$517,862,000 and imports at \$465,518,000, but as compared with 1929, imports decreased 21 per cent and exports 15 per cent. The 1929 exports were \$606,707,000 and imports were \$591,641,000. Imports of the two leading import commodities, cotton and wool, both declined in 1930, the

former by 8 per cent in quantity and 27 per cent in value and the latter by 10 per cent in quantity and 36 per cent in value. Germany furnished 25 per cent of all imports for consumption, as compared with 8.8 per cent furnished by the free port of Hamburg, 7.7 per cent by Austria, 5 per cent by the United States, 3.7 per cent by the United Kingdom, and 3.6 per cent by France. Germany was also the principal market, taking 17 per cent of all exports, compared with Austria, 14 per cent; the United Kingdom, 7.8; the United States, 5.6; and France, 2.3. Exports to the United States decreased 34 per cent as compared with 1929, while imports from that country declined 28 per cent in value.

Iron and steel, cotton piece goods, glass and glassware, wool fabrics, refined sugar, silk and manufactures, and leather footwear, in the order named, were the leading exports. The principal imports, in order of value, were: Raw cotton, wool, machinery, nonferrous metals, mineral oils, iron and steel, swine, and wheat flour. Preliminary figures for 1931 placed imports at 11,789,000,000 crowns and exports at 13,140,000,000 crowns, leaving a favorable trade balance of 1,351,000,000 crowns (1 crown equals \$0.0296). Compared with 1930, exports declined 24.8 per cent and imports 25 per cent.

FINANCE. Closed accounts for the 1930 budget showed a deficit of 666,108,000 crowns (\$19,743,500), in contrast with surpluses of 328,722,000 crowns in 1928 and 338,271,000 crowns in 1929 (1 crown equals \$0.0296 at par). Actual revenues were 9,645,444,000 crowns and actual expenditures 10,311,552,000 crowns, including unbudgeted expenditures of 1,025,491,000 crowns, as compared with the estimated revenues of 9,419,867,000 crowns and estimated expenditures of 9,366,905,000 crowns. In the 1931 budget, receipts were estimated at 9,844,000,000 and expenditures at 9,838,000,000 crowns. The budget for 1932, as accepted by Parliament in October, 1931, was based on estimated receipts and expenditures 5.3 per cent (about 15,400,000) less than the 1931 budget estimates; the totals were 9,323,376,000 and 9,318,709,000 crowns, respectively.

The public debt on Jan. 1, 1931, totaled 36,916,000,000 crowns (about \$1,092,714,000), compared with 36,223,600,000 crowns (about \$1,072,219,000) a year earlier. The internal debt totaled 25,039,000,000 crowns and the external debt 8,425,000,000 crowns, including \$168,571,000 due to the U. S. government.

COMMUNICATIONS. The Czechoslovak railways, 98 per cent of which are government owned or controlled, had 8367 miles of line in 1930. In that year they carried 73,894,000 metric tons of freight (83,831,000 in 1929) and 264,762,000 passengers (270,992,000 in 1929), earning gross receipts on these services of 3,934,580,000 crowns (4,461,612,000 crowns in 1929). In 1931, there were about 49,000 miles of highways, including 5300 miles of state highway maintained by the National government. Statistics of civil aviation in 1930 were: Flights, 5447; passengers carried, 12,382 (11,345 in 1929); mail carried, 94,456 pounds (55,318); goods carried, 1,071,839 pounds (1,492,347). Telegraph lines (1929) totaled about 10,459 miles, virtually all of which were under government control. The Danube is the principal waterway, with Bratislava as the chief port; the Elbe and Vltava Rivers also are extensively used for freight shipments.

**GOVERNMENT.** According to the constitution adopted by the National Assembly, Feb. 29, 1920, executive power is vested in a president, elected for seven years by the two chambers in joint session, who appoints and recalls his ministers; and legislative power in a senate of 150 members elected for eight years and a chamber of deputies elected for six years, the former elected by all citizens over 26 years of age and the latter by all citizens over 21 years of age. The principle of proportional representation is applied. The composition of the Chamber of Deputies following the election of Oct. 31, 1929, was as follows: Czech Agrarians, 46; Czech Socialist Democrats, 39; Czech National Socialists, 32; Communists, 30; Czech Clericals, 25; German Social Democrats, 21; Slovak Clericals, 19; German Agrarian and Middle Class parties, 16; Czech National Democrats, 15; German Christian Socialists, 14; Czech Small Traders, 12; Hungarian Christian Socialists, 9; German National Socialists, 8; German Nationals, 7; Poles and Jews, 4; League for Election Reform, 3.

President in 1931, Thomas Garrigue Masaryk, reelected May 27, 1927. The coalition government formed Dec. 8, 1929, was constituted as follows: Prime Minister, František Udržal (Czech Agrarian); Foreign Affairs, Dr. Eduard Beneš (Czech National Socialist); National Defense, Dr. K. Viškovský; Finance, Karl Arapl (Apr. 16, 1931); Interior, Dr. J. Slávik; Commerce, Dr. Josef Matoušek; Health, Dr. Franz Spina; Railways, Rudolf Mlčoch; Social Welfare, Dr. Ludwig Czech; Justice, Dr. Alfred Meissner; Agriculture, Bohumil Bradáč; Education, Dr. Ivan Dérer; Posts and Telegraphs, Dr. Emile Franke; Public Works, Jan Dostálek; Unification of Laws, Dr. Jan Šrámek; Food, Rudolf Bechyně. The Cabinet represented a coalition of all Czech parties, bourgeois and socialists, and the German-Magyar Agrarians and Social Democrats.

### HISTORY

**DOMESTIC AFFAIRS.** While sharing the common fate of Europe in the drastic curtailment of trade, increased unemployment, financial stringency, and onerous exchange restrictions, Czechoslovakia during 1931 remained free from striking political, economic, and financial crises. The Udržal Coalition government established in 1929 remained firmly in the saddle and even strengthened its position in the municipal elections in the autumn. Despite intense nationalistic antagonisms aroused elsewhere in Europe by the Austro-German Customs Union and other incidents, the relations of Czechs, Germans, and Slovaks within Czechoslovakia were, in general, more friendly than in former years. Dr. Franz Spina, one of the two German members of the cabinet, testified to the great improvement in German-Czech relations in a speech before the German Farmers party congress in March.

Toward the end of 1931 the nation became genuinely alarmed at the economic prospects. The financial and economic storm of the summer had virtually bankrupted all of the neighboring states to which the bulk of Czechoslovak exports are normally sold. Home consumption declined, unemployment mounted, and the government was obliged to extend relief by direct doles and by providing employment on public works and the state forests. There was a revival of Communist agitation and in a clash between police and "hunger marchers" in Czechoslovak Silesia No-

vember 25, nine persons were killed and 15 badly wounded. The government at the beginning of the year was in an exceptionally strong financial position. In April, negotiations were opened with French bankers for a \$50,000,000 loan to enable the conversion of the 8 per cent external gold loan of 1922 at a lower interest rate. The negotiations were unsuccessful, but the Czechoslovak financial system weathered a severe exchange crisis in September and the crown remained among the stable currencies. The Hoover moratorium proved a distinct aid to the national finances, postponing external payments aggregating \$7,000,000. By several decrees issued in October, foreign exchange transactions were placed under the supervision of the National Bank.

**FOREIGN RELATIONS.** The Czechoslovak Foreign Office during 1931 was chiefly concerned with the problem of the steady economic decline of the countries of Central Europe and the serious repercussions upon Czechoslovak prosperity. Throughout the year, negotiations were carried on for a reduction of the barriers to trade with neighboring countries, but political complications prevented any noteworthy progress. A Czechoslovak delegation was in Vienna for the purpose of negotiating a trade convention when the announcement on March 20 of the Austro-German Customs Union proposal precipitated a crucial diplomatic and financial struggle between France and Germany (See AUSTRIA, FRANCE, and GERMANY under *History*). Foreign Minister Beneš entered vigorously into this struggle on the side of Czechoslovakia's ally, France. In repeated speeches he denounced the proposal as the first step toward the political union of Austria and Germany, which would leave Czechoslovakia surrounded on three sides by a greater Germany. In a speech before the Foreign Affairs Committee of the Czechoslovak Parliament April 23 and again before the Austrian Minister to Prague in October, M. Beneš outlined alternative proposals to the Austro-German Customs Union. His first proposal was based on adherence to the most-favored-nation principle, with the mutual extension of trade preferences between the European agricultural and industrial countries. His second project called for a customs union of Czechoslovakia, Austria, Hungary, and Yugoslavia. It encountered the strong Pan-German sentiment in Austria and aroused little enthusiasm.

Meanwhile the government had concluded a new commercial treaty with Yugoslavia in April, negotiations for a similar treaty with Greece had been inaugurated, and the Czechoslovak delegation had returned to Vienna to renew negotiations for a trade convention. At the annual conference of the Little Entente Foreign Ministers held at Bucharest May 3-5, M. Beneš succeeded in securing the united support of the Rumanian and Yugoslav governments in opposition to the Austro-German Customs Union (see LITTLE ENTENTE). On December 10 M. Beneš indicated that Czechoslovakia was ready to take the initiative in promoting some form of economic union of Central Europe, but that the government could afford to wait until the other nations were in a more receptive mood. His statement gained importance from the fact that at the same time representatives of Czechoslovakia, Poland, Hungary, Rumania, Yugoslavia, and Bulgaria were holding an agrarian conference in Sofia in the presence of representa-

tives of the League of Nations' international agrarian board and other interested parties.

**DADAÏSTS.** See FRENCH LITERATURE.

**DAHOMÉY,** dá-hô'ml. A French colony on the west coast of Africa forming a subdivision of the colony of French West Africa. (See FRENCH WEST AFRICA.) The colony has only about 70 miles of coast, but a wide hinterland. Area, 62,722 square miles; population, according to the census of 1929, 1,080,447 (1093 Europeans). The chief centre of trade and the seat of the government is Porto Novo with a population of 23,614. Imports in 1929 amounted to 147,647,058 francs; exports, 120,691,697 francs. The local budget for 1930 was 55,602,500 francs. In 1931, there were 270 miles of railway line and more than 2700 miles of highways, including 495 miles of first-class roads. Lieut.-Governor in 1931, M. Reste.

**DAIRYING.** The unsettled conditions and sharp decline in prices of dairy products in the United States characteristic of the preceding year were continued well into 1931. Reduced buying power, increased competition, and large supplies of dairy products both at home and abroad combined to decrease the incomes of dairymen. Pasture conditions were poorer during the early summer than during 1930. Seasonal price raises had not materialized and during the latter part of the year tended to decline, a condition that had not prevailed for many years.

Adjustments to meet prevailing conditions were undertaken early in 1931. Low-producing animals were culled from herds, and the proportion of heifers in herds was materially reduced. However, in the early autumn there were nearly 4 per cent more milk cows on farms than there were in the fall of 1930. The relatively low cost of feeds was the redeeming feature in the field of production. At practically all times during the year there was a comfortable margin between the cost of feeds and the prices obtained for dairy products. Due to the poor pastures and the reduction in the amount of supplementary feeding during the spring and early summer the flush of production did not occur. This tended to have a stabilizing effect and reduced reserve stocks of dairy products. Production fluctuated throughout the year, but due to the favorable fall weather the usual decline in production was late in occurring.

The consumption of butter, cheese, and condensed milk in 1931 showed an increase of about 1 per cent as compared with 1930. On the other hand, the production of these commodities declined somewhat less than 1 per cent. The greatest decrease was in the amount of condensed and evaporated milk produced.

Dairy surpluses have usually gone mostly into butter and this market carried the burden of disposing of these surpluses. The amount of butter in storage the first of November, 1930, was 110,000,000 pounds as compared with 138,000,000 pounds on that date in 1929. This amount was about 2,000,000 pounds below the 5-year average. However, on Nov. 1, 1931, the total stocks of butter in cold storage amounted to 56,000,000 pounds. This was the smallest storage of butter on record at that particular date, being 24 per cent below the previous low. The consumption of butter was stimulated somewhat by the low prices which prevailed during the greater part of the year.

The consumption of evaporated milk increased,

but it was probable that a large amount of this stock moved into the hands of wholesale grocers and did not reach the ultimate consumer. The increased consumption of evaporated milk was also offset to some degree by a reduced demand for fluid milk. Cheese consumption in 1931 was short of that of the previous year, but retail prices of this commodity were relatively higher during most of the year than butter prices. The stocks of butter, cheese, and condensed and evaporated milk on hand in the fall of 1931 was about 30 per cent less than the average for the last five years.

Fluid milk prices for the year were relatively stable throughout most of the fluid-milk territories. Buying prices by distributors for fluid milk for use as such, declined about 23 per cent during the two years 1930 and 1931 as compared with a 30 per cent decline in butter prices and a 35 per cent decline in cheese prices, but on account of lower feed prices and the reduction in storage stocks, dairying occupied a relatively strong position in 1931 as compared with other agricultural enterprises.

Efforts to protect both domestic producers and consumers of butter resulted in proposed legislation regulating the sale and distribution of oleomargarine which was considered by 37 State Legislatures. One or more laws of this nature passed in the following States: California, Colorado, Idaho, Illinois, Iowa, Kansas, Michigan, Minnesota, Montana, Nebraska, New Hampshire, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, South Dakota, Tennessee, Vermont, Washington, Wisconsin, and Wyoming. Of these States, 12 imposed sales taxes, 12 prohibited the sale of yellow oleomargarine, 5 prohibited the use of oleomargarine in public institutions, and 6 either placed dealers under license or increased the license fees previously provided.

**INTERNATIONAL CONDITIONS.** Prices for both butter and cheese in foreign markets, excepting Germany, were well maintained despite heavier supplies than in 1930. Weakened buying power in Germany continued to limit importation of butter into that country. Canada, with exports of milk and cream, and New Zealand with butter practically excluded from the United States by the high tariff rates, were active competitors of American butter on the European markets.

Butter production in Canada increased 15 per cent during the first eight months of the year as compared with 1930, while an unfavorable season in New Zealand held the increase in butter production to 2.5 per cent during the year ended Aug. 1, 1931, the smallest increase for several years. On the other hand, the exports of butter from Australia for the year ended June 30, 1931, amounted to 163,500,000 pounds as compared with 107,551,000 pounds for the previous year.

Both domestic imports and exports of dairy products of the United States were considerably less in 1931 than in the preceding year, and there continued to be an excess in values of imports over exports of dairy products amounting to about \$4,735,000 for the entire year. The exportation of dried milk more than doubled in quantity in 1931 over 1930, but the amount of condensed and evaporated milk exported, the second largest article of export, decreased somewhat. While all imports decreased, the largest decline was in the amount of butter brought in.

**TRENDS IN RESEARCH.** Numerous research studies were in progress at the State Agricultural Experiment Stations and the U. S. Department of Agriculture dealing with quality of dairy products, new methods or modifications of old methods in the manufacture of these products, nutrition as it affects growth, production, and reproduction, and new and better methods of marketing dairy products. These studies may be expected to furnish valuable information, both for the producer and consumer of the products of the dairy cow.

Both the Bureau of Dairy Industry and the Nebraska Agricultural Experiment Station found that more than two milkings daily with high-producing cows increased the butterfat and milk production. It was believed that emptying the udder relieved the pressure and permitted secretion to function in a normal manner. The additional milkings tended to increase the fat content of the milk. The value of the additional milkings was more pronounced when they were carried out through the entire lactation period. The Bureau of Dairy Industry, in its study, also discovered that, contrary to popular belief, the decrease in yield of milk due to a change in milkers was practically negligible.

The possibility of producing milk with a definite antirachitic potency was suggested by studies at the Wisconsin Agricultural Experiment Station. The feeding of 50 gm. of irradiated yeast daily to dairy cows increased the antirachitic value of their milk and as much as 200 gm. daily of yeast was fed without any detrimental effect on milk production. Daily exposure of the cows to sunlight or artificial ultra-violet light did not improve the antirachitic value of the milk. The feeding of irradiated ergosterol to dairy cows at the Ohio Agricultural Experiment Station brought about an improvement in the vitamin D content of the butterfat.

The effect of carbonation on dairy products was studied at the Illinois Agricultural Experiment Station. It was found that carbonation tended to inhibit the growth of some species of bacteria, while others multiplied as rapidly as in uncarbonated products. This inhibiting effect tended to prolong the keeping period of the product, but the temperature at which the product was kept after carbonation, the pressure of the carbon dioxide gas, and the amount and kind of bacterial contamination prior to carbonation also influenced the keeping period.

The use of condensed and dried milks in the manufacture of ice cream is becoming more common because of the convenience and keeping qualities of these products. The Bureau of Dairy Industry found that spray-dried skim milk, preheated to 83° C., imparted the most desirable properties to ice cream. Superheated condensed skim milk improved the quality of ice cream more than when not superheated or when it was preheated, but was not as valuable as the preheated spray-dried skim milk. Atmospheric roll dry skim milk was relatively insoluble and imparted a distinct cooked or custard-like flavor to the ice cream in which it was used at both the New York (Cornell) and Pennsylvania Agricultural Experiment Stations.

The ninth International Dairy Congress was held in Copenhagen from July 13 to 17, 1931. It was attended by more than 1600 delegates and there were official representatives from more than

30 governments. A special branch of tropical dairying was formed. The next Congress was to be held in Berlin in 1934.

During the year James Turner presented to the State of New Jersey, for administration as a dairy research station, 1100 acres of crop and pasture land, 270 Guernsey and 55 Holstein cattle, and elaborate buildings and equipment. The State designated the New Jersey Agricultural Experiment Station to administer this project. The gift, to be known as the James Turner Institute of Research, is a valuable addition to the research equipment of the State.

**PERSONNEL.** Dr. S. M. Babcock (q.v.), of Wisconsin University, died July 1, 1931. Dr. Babcock was most widely known as the inventor of the butterfat test which is the basis for all Advanced Registry work. Dr. Babcock also made other extensive and valuable contributions to the field of dairy chemistry. On Sept. 20, 1931, Dr. L. L. Van Slyke (q.v.), of the New York (Geneva) Agricultural Experiment Station, died. Dr. Van Slyke was an important contributor toward the advancement of the knowledge of the chemistry of milk, cheese, and butter. G. A. Bowling was appointed assistant professor of dairy husbandry at West Virginia University vice K. S. Morrow, resigned to become associate extension dairyman, Rutgers University. W. S. Mueller was appointed assistant research professor of dairying at the Massachusetts State College of Agriculture, vice K. E. Wright, resigned.

**BIBLIOGRAPHY.** The more important reference books on dairying, recently published, include: H. F. Judkins, *Principles of Dairying* (New York, 2d ed. rev., 1931); R. M. Washburn, *Productive Dairying* (Philadelphia, 4th ed. rev., 1931); A. G. House, *Bacteriological Control of Milk* (Cambridge, Eng., 1931); Orla-Jensen, *Dairy Bacteriology* (Philadelphia, 2d ed., 1931); *History of British Friesian Cattle* (Lewes, Eng., 1930); J. U. Duerst, *Grundlagen der Kinderrucht* (Berlin, 1931); R. S. Maynard, *Australian Dairyman's Handbook* (Sydney, 1931); W. Winkler, et al., *Handbuch der Milchwirtschaft* (Vienna, 1930); Katharine Snodgrass, *Margarine as a Butter Substitute* (1930); C. W. Walker-Tisdale, *The Practice of Soft Cheesemaking* (London, 1931). See FOOD AND NUTRITION; VETERINARY MEDICINE.

**DAKAR.** See FRENCH WEST AFRICA.

**DALMATIA.** A crownland of Austria until 1918, and then a Province of Yugoslavia until the administrative reorganization of Oct. 3, 1929 (see YUGOSLAVIA). It extended from Bosnia and the Herzegovina west to the Adriatic Sea. Area, 4916 square miles; population, according to the census of Jan. 31, 1921, 621,420.

**DAMS.** There has never been a period which has witnessed such great hydraulic undertakings as those under construction in the United States during the year 1931. It is therefore natural that the design and construction of such basic hydraulic structures as dams should command particular attention. Furthermore, all records for magnitude of construction were being exceeded almost yearly in the construction of great reservoirs for water supply for domestic, power, or irrigation purposes, which require dams of unprecedented height. Nevertheless among all these great works the Hoover Dam stands out clearly as the greatest hydraulic engineering

structure ever attempted by man and the largest hydraulic project since the building of the Panama Canal.

**THE HOOVER DAM.** The earlier stages of this great enterprise have been outlined in previous **YEAR BOOKS**, but the year 1931 marked the beginning of the actual work of construction. On March 4 bids were opened in Denver, Col., and on March 11, the largest single contract ever let was awarded to the Six Companies, Inc., of San Francisco. This organization, a syndicate of six experienced western contractors, submitted the lowest bid of the three offers, and undertook to build the Hoover Dam in seven years for the sum of \$48,890,995.

While the most interesting feature of the plans and specifications, outlined in the 1930 **YEAR BOOK**, is probably the method to be followed in securing a monolithic mass of concrete for the dam proper, actual construction of the dam was not to begin for three years. In other words the amount of excavation and preliminary construction in connection with this 730-ft.-high structure, with its staggering total of 2½ million cubic yards of concrete, is such that actual placing of concrete was not scheduled to start until Dec. 1, 1934. Nevertheless the preliminary construction is on such a vast scale and is of such great magnitude that it is of special interest.

There was no delay in starting this great work although it was not until April 20 that the contract, quickly signed by the representatives of the Six Companies, was made fully effective by the approval of final plans by the consulting experts and the affixing of Secretary Wilbur's signature. In the meantime the Six Companies had courageously gone ahead perfecting their organization. By April 26, six days after the contract was signed, the Union Pacific Railroad had completed its new line, started the previous September to the site of the new Boulder City. Twice daily trains run from Las Vegas, Nevada. By June 27 electric power from the Southern Sierras Power Co. was available at the dam site over a 225-mile transmission line.

On July 31 the highway, 7 miles long, to bring the workers from their homes in Boulder City to the Dam, was completed.

These essential preliminaries permitted the Boulder Canyon activities, in spite of a summer of terrific heat, already to settle down to the steady pull of a seven-year job under complete control and organization.

**Boulder City.** About \$2,000,000 was being spent in building on a desert waste a complete modern city. High above the river and consequently much less subject to the terrific heat of this region, which is particularly bad in the canyon, streets, water supply, sewerage, electric lights, telephones, transportation, and other municipal facilities were provided. A city-manager type of government was instituted and over 130 applications for business enterprises were approved. The Six Companies built housing facilities for their construction force, which include a mess-hall for 1000 men provided with every modern facility, the most complete ever built for such a purpose.

**Transportation.** The first steps looking toward actual construction required the blasting of a road approach to the portals of the great diversion tunnels, the construction of 26 miles

of railroad to open up the gravel deposits and make the dam site accessible to standard railroad equipment, and the construction of four suspension bridges for foot passage across the canyon. The government was also to construct under separate contract a 10½-mile railroad from Boulder City to the canyon rim where it will join a funicular railroad from the river bottom. Other suspension highway bridges also were to be built.

**Tunnel Operations.** Construction operations in the dam could not, of course, be undertaken until the four 50-ft. diameter diversion tunnels, which will carry the river flow around the dam site, and the necessary coffer dams to divert the flow to the tunnels, were completed. It was therefore vitally important to begin the tunneling operations as soon as possible. They were being excavated by attacking from both the four upstream and four downstream portals as well as from two additional headings in each tunnel, opened up by driving adits in from the canyon walls at about the midpoints. Each tunnel is about 4000 ft. long. Boat transportation was used to bring in equipment and begin operations before the construction road was available. The 12 by 12-ft. top-centre pioneer headings of the two inner tunnels were holed through on the south halves in September and proved the rock to be satisfactory in character.

By December the pioneer headings of all four tunnels had been completed. Enlargement operations were started in October. Electric shovels, 2¼-yard capacity, handled muck directly to trucks and later would deliver to railway cars. Three main electrically operated compressed air plants supplied the drills.

**Gravel Plant.** Gravel from the Arizona deposits will be brought by railroad to a great screening and washing plant which will have a capacity of 500 tons of gravel per hour. This was under construction as well as a water-softening and purification plant which will provide 400,000 gallons of water every 16 hours for concrete mixing and other purposes. Another 800,000-gallon clarification and purification plant will supply water at Junction City for the gravel and screening plant. Excavation also was completed for the concrete-mixing plant.

**Labor.** It was early recognized that the climate of this area would be very trying on labor. Every effort was made to minimize these difficulties. Nevertheless as a result of the terrific summer heat and because of a dispute over minimum wage a strike was called August 7. The Six Companies suspended work on the contract but on August 13 work was resumed and on August 16 the strike was called off. By September, as a result of cooler weather, efficiency and morale were restored and the turnover among the 3000 men employed was greatly reduced. Considering the magnitude of the project the number of accidents had not been large. See also **CANALS** under *All-American Canal*.

**DAMS COMPLETED.** On July 12 the huge rock fill dam of the Pacific Gas & Electric Co. of California was dedicated. This structure on the Mokelumne River development and known as the Salt Springs Dam, is 328 ft. high and has a crest length of 1300 ft. The precautions taken in this great power work to secure a solid and water-tight structure were noted in the

1930 YEAR BOOK. It is part of a \$40,000,000 development which will utilize a total head of 5000 ft. by means of four power plants and two reservoirs.

On May 20 the Big Tujunga Dam No. 1, of the Los Angeles County Flood Control District, was completed. This variable radius type of arch dam is 240 ft. high. It is the first of four flood control and conservation dams to be built in the Big Tujunga Canyon and the thirteenth major dam to be constructed in the district.

The Inland Power & Light Co. completed on the Ariel Hydro-electric Project, Wash., on September 1, the first of seven power dams to be built on the Lewis River, a tributary of the Columbia. The Ariel Dam gives 45,000 kw. in one generating unit and a total of four equal units will be installed. The dam is another notable thin-arch variable radius type of 312 ft. in height. Its foundations had to be carried 123 ft. below normal water level and all concrete up to stream level placed in a working period between floods of only 150 days. The method of placing concrete in 30-ft. sections separated by 2-ft. spaces, providing radiating surface in four directions for dissipating the heat of setting and other precautions taken to eliminate shrinkage and temperature effects and secure a solid concrete mass, mark this work as an outstanding example of modern concrete dam construction.

The Cushman Dam No. 2, another power structure, was completed early in the year for the power supply of Tacoma, Wash. This also is a notable arch dam, being 240 ft. high.

Interest in the Calderwood Dam on the Little Tennessee River near Knoxville, Tenn., centres on the spillway fall and on the crest gates. The spillway capacity of this 230-ft. arch dam is 200,000 cubic feet per second. Its construction has been noted in previous YEAR BOOKS and its mechanically and electrically operated crest gates were accepted as the last word in the design and construction of such devices.

On February 19 a remarkable construction record was celebrated in the closing of the temporary sluice gates of the Bagnel Dam of the 129,000 kw. Osage hydro-electric project in Missouri. In only 18½ months after the start of construction this great masonry dam, having a maximum height of 148 ft. and 2543 ft. long, had started to impound water in what will be the largest lake in the State. The reservoir will be 130 miles long and will cover 95 square miles.

**DAMS UNDER CONSTRUCTION.** Next to the Hoover Dam, the arch-gravity type Owyhee Dam of the U. S. Reclamation Service, now under construction in eastern Oregon, was of special interest to engineers. It is a record-height structure, being 530 ft. from the bottom of foundations to the crest, and will provide 715,000 acre ft. of storage. When concreting was resumed on February 23, after the mid-winter layoff on account of the severe weather at the dam site, the dam was about half completed. Excellent progress was made during the summer and on November 23, when work was again suspended, it was 90 per cent completed. Over half a million cubic yards of concrete are involved in the construction.

Work again was going forward on the Cobble Mountain Dam for the water supply of Springfield, Mass. It was necessary to relet the contract for this hydraulic fill structure which will be the highest earth dam in the world—250 ft.

above foundations. The dam is located in the hills west of Westfield, Mass., and, at the request of this city, the adequacy of the design was recently reported on and approved by a special engineering board.

What is believed to be the greatest flood ever handled during the construction of a dam was passed through the openings left in the spillway of the great Dneiper Dam in Russia during a flood in May. A peak of 835,000 cubic ft. of water per second passed this work without damage to the permanent works. The dam is an essential part of the huge Dneiper River power development.

Chile was undertaking the construction of 18 dams under a recent reclamation act. All these structures are of the so-called earthquake proof type. The Cogoti Dam, one of the group, is a particularly interesting rock-fill structure in which precautions have been taken to secure a fill which will not settle under shock and a water-tight apron which will flex without rupture.

**DAM PROJECTS.** It seems probable that there will be a reduced building, particularly in power construction, in the near future, and that for the next few years the Hoover Dam may be almost the only notable structure under way. Nevertheless the U. S. Reclamation Service opened bids on July 10 for the Cle Elum Dam to be located 8 miles from the town of this name in the State of Washington. It was to be an earth-fill type 125 ft. high, not a record structure but a high earth dam.

Another important dam project is the Pine Canyon Dam on the San Gabriel River. This work was to have been of the notable height of 295 ft., but the Pasadena (Calif.) Board of City Directors ordered the height reduced to 245 ft., because it was uncertain whether the Metropolitan Water District of Southern California should utilize the work for storage of Colorado River water from the new aqueduct.

In view of recent widespread dam construction in the Western States and remembering the fatal St. Francis Dam failure, it is interesting to note that a board of engineers and geologists had reported adversely on the Mulholland Dam. This dam is located in the Hollywood Hills, Calif., and is similar in type to the St. Francis Dam and was constructed prior to the latter structure. The report pointed out that there were deficiencies of structure in the Mulholland Dam and that it rested on faulted foundation rock. Insufficient base width with no allowance for uplift, improper terracing of foundations to provide against sliding, and insufficient provision for drainage of foundations were noted.

**DANA, RICHARD HENRY.** An American lawyer, died Dec. 16, 1931, in Cambridge, Mass., where he was born Jan. 3, 1851. Following his graduation from the Harvard Law School in 1877, he was admitted to the Massachusetts bar and practiced in Boston. In 1878-79 he organized the Associated Charities of Boston. He drafted the Civil Service Reform Act of Massachusetts in 1884 and the Australian Ballot Act in 1888, the first to be passed in the United States. From 1889 to 1892 he was editor of the *Civil Service Record*. His activities in behalf of civil service, taxation, ballot, election, municipal, and social reforms led to his being made chairman of the council of the National Civil Service Reform League (1905-12) and president (1913-23). He

was the author of *Double Taxation in Massachusetts* (1895); *The Corrupt Practices Act* (1906); *The Australian Ballot System of Massachusetts* (1911); and *Hospitable England in the Seventies* (1921). He also wrote in 1911 an introduction and concluding chapter to the sea classic, *Two Years Before the Mast*, published by his father, Richard Henry Dana, in 1840.

**DANISH LITERATURE.** See SCANDINAVIAN LITERATURE.

**DANZIG**, dän'tsik. A Baltic port, occupying a strategic position at the mouth of the Vistula River, which, with its surrounding territory, was established as a free city on Nov. 9, 1920, under the terms of the Treaty of Versailles. It was formerly a part of the German Empire. Area, about 754 square miles; population in 1929, 407,620, of whom 236,064 were in the city proper. The population in 1929 was 95 per cent German and less than 5 per cent Polish. German is the official language. Of the 1924 population, 222,868 were Protestants, 140,797 Roman Catholics, and 9239 Jews. In 1929, there were 44,632 children in elementary schools, 3228 in middle schools, and 6207 in high schools.

Danzig is advantageously situated with relation to the great Polish, German, and Russian grain districts and has been the chief outlet for the foreign commerce of Poland, which exercises joint control with the Free City of the harbor administration. The territory is also within the Polish Customs administration. Traffic through the port in 1930 amounted to 8,217,000 metric tons, which was 343,000 tons, or 4 per cent, below the 1929 total. The decline in traffic through other Baltic ports, however, was about 20 per cent. The prosperity of Danzig was adversely affected in 1930 and 1931 by the growth of the new Polish port of Gdynia (see **POLAND** under *Communications*) and by the establishment of Polish Government agencies for the direct sale of Polish exports and the direct purchase of such Polish imports as potash salts and nitrates.

A total of 6078 vessels of 4,143,000 net registered tons arrived at Danzig during 1930, as compared with 5396 vessels of 3,892,000 tons in 1929. Vessels cleared numbered 6080 of 4,143,000 net registered tons, as against 5432 vessels of 3,918,000 tons in the previous year. With the aid of a short-term loan, reduced expenditures, and higher taxes, the budget for the fiscal year ended Mar. 31, 1931, was tentatively balanced at 88,583,000 gulden (\$17,700,000 at the exchange rate of \$0.1944). Four main railway lines connect Danzig with important German cities, while three other main lines run to leading Polish cities. Air lines link the port with various German and Polish points and with Kalmar, Sweden.

Danzig is under the protection of the League of Nations, which appoints a High Commissioner to settle disputes between the Free City and Poland. Foreign relations are controlled by Poland, but the Free City exercises a veto power. The Constitution, as approved by the League of Nations May 11, 1922, vests executive power in the President of the Senate, which is the highest state authority. A Diet of 72 members elected for four years by universal suffrage elects the members of the Senate and its President. The composition of the Diet elected Nov. 16, 1930, was: Social Democrats, 19; National Socialists (Hitlerites), 12; Centrists, 11; Na-

tional Germans, 10; Communists, 7; National People's party, 3; other parties, 10. President of the Senate in 1931, Dr. Ernst Ziehm, elected January, 1931. High Commissioner of the League of Nations, Count Manfred Gravinga, appointed September, 1928.

For relations with Poland in 1931, see **POLAND** under *History*; also see **WORLD COURT**. An important proposal for the solution of Danzig's political and economic problems was put forward by Prof. James T. Shotwell in the *New York Times* of Oct. 10, 1931.

**DARTMOUTH COLLEGE.** A nonsectarian institution for the higher education of men in Hanover, N. H., founded in 1769. The 1931 autumn session had an enrollment of 2375 students, most of whom were working for the B.A. degree, the exceptions being 15 graduate students, 40 students in the medical school, 19 in the Thayer School of Civil Engineering, and 88 in the Tuck School of Administration and Finance. There were 303 members on the faculty. The endowment amounted to \$15,600,000, while the income for the year was \$750,000. The Fisher Ames Baker Memorial Library contained 328,905 volumes. President, Ernest Martin Hopkins, A.M., Litt.D., LL.D.

**DATE SCALE.** See **ENTOMOLOGY**, **ECONOMIC**.

**DAVIS, HARRY PHILLIPS.** An American electrical engineer, died in Wilkesburg, Pa., Sept. 10, 1931. He was born in Somersworth, N. H., July 31, 1868. On graduation from the Worcester Polytechnic Institute in 1891, he became associated with the Westinghouse Electric & Manufacturing Co., being appointed assistant chief engineer in 1904, manager of engineering activities in 1909, assistant to the first vice president in 1910, and vice president in charge of manufacturing and engineering after 1911. He took a leading part in the establishment of radio broadcasting as a public utility, inaugurating at East Pittsburgh, Pa., in 1920 station KDKA, the first to be established for the commercial exploitation of radio by stimulating the manufacture and sale of receiving equipment. He also was instrumental in the establishment of major stations in Chicago, Newark, and Springfield, and on the organization of the National Broadcasting Company in 1926 became chairman of its board of directors. In addition to being a director of the Radio Corporation of America, the Radio-Keith-Orpheum Corporation, and the RCA-Victor Corporation of America, he was president and director of the Westinghouse High Voltage Insulation Company, vice president and director of the Westinghouse Electric Products Company, the Turtle Creek & Allegheny River Railroad, and the Westinghouse Inter-Works Railway, and director of the Westinghouse Lamp Company and the Westinghouse Electric International Company. He was responsible for many important advances in the electrical field, among his inventions being appliances for improving railway control apparatus, rheostats, arc lamps, switches, integrating wattmeters, circuit breakers, and transmission equipment. He also supervised the electrification of the New York, New Haven & Hartford Railroad, the Hoosac Tunnel at North Adams, Mass., the St. Clair Tunnel of the Grand Trunk Western Railway between Ontario and Michigan, and the Pennsylvania Railroad terminal in New York City.

**DAVIS COLLECTION.** See **ART MUSEUMS**.

**DEATH RATE.** See **VITAL STATISTICS**.

**DEAVER, JOHN BLAIR.** An American surgeon, died in Wyncote, Pa., Sept. 25, 1931. Born near Buck, Pa., in 1855, he received the M.D. degree from the University of Pennsylvania in 1878, and eight years later was appointed surgeon-in-chief at the German (later the Lankenau) Hospital. He also was consulting surgeon to several other Philadelphia hospitals. From 1891 to 1900 he was assistant professor of applied anatomy at the medical school of the University of Pennsylvania, and from 1914 to 1923 professor of the practice of surgery, holding the John Rhea Barton professorship of surgery after 1918. He was president of the American College of Surgeons in 1921. His major publications include *Surgical Anatomy* (3 vols., 1889-93); *Enlargement of the Prostate* (with A. P. C. Ashhurst, 1895); *Appendicitis: Its History, Pathology, and Treatment* (1897); *Surgery of the Upper Abdomen* (with Ashhurst, 2 vols., 1909, 1913); *Surgical Anatomy of the Head and Neck* (1912); and *Diseases of the Breast* (with Joseph McFarland, 1917).

**DEBTS, PUBLIC.** See PUBLIC FINANCE; GREAT BRITAIN, ETC., under *Finance*.

**DECEPTION ISLAND.** Deception Island (Lat. 63° S., Long. 60° 15' W.) near the northern extremity of Graham Land is a volcanic island into whose breached crater the sea has entered and provided an excellent land-locked harbor for the whaling vessels congregating in the adjoining waters each year. See POLAR RESEARCH.

**DEFECTIVES.** See CRIME; CHILD WELFARE.

**DE FOREST, ROBERT WEEKS.** An American lawyer and philanthropist, died May 6, 1931, in New York City where he was born Apr. 25, 1848. He was educated at Yale (A.B., 1870), Columbia (LL.B., 1872), and Bonn. When first admitted to the bar, he was associated with his father and uncle; later the firm included his brother and sons. From 1874 to 1924 he was general counsel, and after 1902 vice president of the Central Railroad of New Jersey, and he came to hold offices or directorships in a number of other corporations. Actively identifying himself with a variety of public and philanthropic interests, he served as president of the Charity Organization Society of New York City after 1888 and of the Welfare Council of New York City after 1925; chairman of the New York State Tenement House Commission in 1900, and New York City's first tenement house commissioner (1902-03); president of the National Conference of Charities and Corrections at Atlanta in 1903; president of the Russell Sage Foundation after 1918; and vice president of the American Red Cross for many years. He was also trustee after 1889, and president beginning in 1913, of the Metropolitan Museum of Art, New York City; president after 1912 of the American Federation of Arts; and president from 1905 to 1929 of the Municipal Art Commission of New York City.

**DE KALB, COURTENAY.** An American mining engineer, died in Tucson, Ariz., Sept. 2, 1931. He was born in Loudon Co., Va., Sept. 18, 1861. In 1895, after practicing in the Western and Southern States and conducting mining expeditions in South America, he was appointed professor of mining and metallurgy at the University of Missouri, holding the same chair three years later at Queen's University, Kingston, Ont., Canada. In 1901 he resumed his practice as manager of the San Fernando mine in Durango,

Mexico. He was associate editor of the Mining and Scientific Press in San Francisco during 1908-10, and again during 1917-19, and president and general manager of the Pacific Smelting & Mining Co. in Guaymas, Mexico, during 1910-12. In 1919 he was appointed trade commissioner of the U. S. Department of Commerce to investigate the mineral resources of Spain, Portugal, and Morocco. He was construction engineer at mines in Arizona during 1921-25 and professor of mining engineering at the University of Alabama during 1925-26, lecturing also at DePauw University.

**DELAWARE. POPULATION.** According to the Fifteenth Census, the population of the State on April 1, 1930, was 238,380; in 1920, 223,003. Wilmington, the chief city, had 106,597 inhabitants in 1930; 110,168 in 1920. The capital city is Dover. According to origin, the population of the State in 1930 contained 188,809 native whites, 16,885 foreign-born whites and 32,602 Negroes. Of 77,221 males reported as having gainful occupations in 1930, 8871 were farmers, 6531 farm laborers for wages, 5438 factory operatives, and 5647 factory laborers. Of the 20,883 females reported in gainful occupations, 2822 were factory operatives, 1462 teachers, 4406 cooks and other servants and 1796 stenographers and typists.

**AGRICULTURE.** The following table shows the acreage, production, and value of the principal crops in 1931 and 1930:

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1931	146,000	4,745,000	\$1,898,000
	1930	138,000	2,622,000	2,386,000
Wheat	1931	91,000	2,138,000	1,138,000
	1930	105,000	2,048,000	1,597,000
Hay, tame	1931	63,000	106,000*	1,166,000
	1930	60,000	60,000*	1,350,000
Potatoes	1931	5,000	540,000	297,000
	1930	4,000	200,000	230,000
Sweet potatoes	1931	8,000	1,400,000	490,000
	1930	7,000	525,000	472,000

\* Tons.

**MINERAL PRODUCTION.** Only the usual minor production of a few minerals was reported for 1929. The chief total was that of clay products, valued at \$230,441 for 1929; for 1928, at \$274,894. The remainder of the total mineral production, which came to \$467,493 for 1929 and to \$481,584 for 1928, consisted largely of stone, raw clay, sand and gravel.

**FINANCE.** State expenditures of the year ended June 30, 1930, as reported to the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$5,881,761 (of which \$1,853,509 was for local education); for interest on debt, \$336,065; for permanent improvements, \$4,854,255; total, \$11,072,081 (of which \$2,719,232 was for highways, \$242,182 being for maintenance and \$2,477,050 for construction). Revenues were \$15,498,789. Of these, property and special taxes formed 65.3 per cent; departmental earnings and remuneration to the State for officers' services, 4.8; sale of licenses, 16.4 (including gasoline sale taxes amounting to \$982,710). The State's funded debt outstanding on June 30, 1930, was \$5,096,285. Net of sinking-fund assets, it was \$4,977,005. On property there were levied in the year no general State taxes.

**MANUFACTURES.** Federal Census data gathered in 1930 and covering 1929 gave the number of the State's manufacturing establishments as 458,

or slightly over that for 1927. These employed 23,382 wage earners, or 9.7 per cent more than those of 1927; the manufacturing wages paid in 1929 totaled \$28,846,113, or about 10 per cent above the 1927 total. Materials for manufacture cost \$72,688,190, and the fuel and purchased electricity used cost \$4,362,483; the materials, fuel, and electricity together costing 11.4 per cent more than in 1927. The manufactured product of 1929 totaled \$146,855,606 in value, which exceeded the value for 1927 by 13 per cent. Value added by manufacture in 1929 was reckoned at \$69,804,933. Wilmington was predominant in manufactures, having in 1929, 192 establishments, 14,822 wage earners, wage payments of \$19,693,481 and manufactured products of \$89,607,934.

**TRANSPORTATION.** The total number of miles of railroad line under operation on Jan. 1, 1931, was 325.14. No important change in this total had occurred during the year preceding. No building of new line or trackage in 1931 was reported.

**EDUCATION.** As reported in December, the estimated school-age population of the State was 52,000. There were enrolled in the public schools 43,092 pupils. Of these, 35,230 were in common schools or elementary grades, and 7862 were in high schools. The yearly expenditure for public-school education was \$5,238,548. Salaries of teachers in public schools averaged, by the year, \$1440. State Superintendent Holloway reported that the Legislature in 1931 had increased the school appropriation by 12 per cent, the increase including for the first time financial aid to kindergartens; that \$3,000,000 had been provided to continue the previously adopted State programme of school construction; and that the systematic teaching of music under the guidance of a State director for this branch had been undertaken.

**CHARITIES AND CORRECTIONS.** In 1931 the duty of supervision over public and publicly aided private benevolent institutions and over correctional institutions continued to be exercised by the State Board of Charities. This Board was composed of five appointees of the Governor, of whom two must be women. It held power to visit children placed in free and boarding homes. State sanatoria for the tubercular were under the State Board of Health.

The following institutions, with the populations indicated, were under the direction of their respective trustees or managers, but were supported in whole or in part by State appropriation: Delaware State Hospital, Farnhurst, 696; Delaware Commission for the Feeble-Minded, 159; Delaware Hospital, 133; Men's Prison, 527; Women's Prison, 28; Ferris Industrial School, 256; Delaware Industrial School for Girls, 76; Industrial School for Colored Girls, 72; New Castle County Hospital, 265.

**LEGISLATION.** Among the acts of the legislative session of 1931 were the creation of a State Old Age Welfare Commission and the passage of an old-age pension law, of which this commission was made the administrator (see OLD AGE PENSIONS). A beginning was made with a proposed constitutional amendment to create a separate State Supreme Court; but this measure, according to the State's system of constitutional amendment, must pass two successive Legislatures. A relatively large provision was made for new public construction whereby it was expected to furnish work for about 10 per cent of the

State's unemployed. Some \$3,000,000 was appropriated for public school construction, \$1,400,000 for roads and an additional \$500,000 for the contemplated new State House, for which the previous Legislature had appropriated an initial \$1,000,000. The legal maximum speed for automobiles in the State was raised to 40 miles an hour, from 35 miles. A refund of 50 per cent of the income taxes paid in 1930, to the payers, was authorized by statute.

**POLITICAL AND OTHER EVENTS.** Awaiting the completion of the settlement of the boundary dispute with New Jersey, the oyster beds in the disputed portion of the bottom of the Delaware estuary were guarded by officials of both States from oystermen's raids, which threatened to bring on an "oyster war."

**OFFICERS.** Governor, C. Douglass Buck; Lieutenant-Governor, J. Henry Hazel; Treasurer, George S. Williams; Auditor, Edward Baker; Secretary of State, Charles H. Grandland; Attorney-General, Reuben Satterthwaite, Jr.

**JUDICIARY.** Chancellor, Josiah O. Wolcott; Chief Justice of Supreme Court, James Pennewill; Associate Justices, Richard S. Rodney, Herbert L. Rice, William Watson Harrington, Charles S. Richards.

**DELAWARE, UNIVERSITY OF.** An institution of higher learning in Newark, Del., founded in 1833. The enrollment in 1931-32 was 750, of whom 471 were men and 279 were women. The enrollment in the 1931 summer session was 443. The faculty numbered 122 members, 88 of whom were on the regular teaching staff, the others being members of the experiment station and extension staffs. Appropriations from the State and Federal Governments amounted to approximately \$441,000; invested endowment funds amounted to \$540,000. The library contained approximately 60,000 volumes. President, Walter Hulihan, Ph.D., D.C.L., LL.D.

**DEMERARA.** The name of a county of British Guiana, sometimes incorrectly used to designate the entire colony. See BRITISH GUIANA.

**DE MOLAY, ORDER OF.** A nonsectarian secret organization for young men between the ages of 16 and 21, founded in 1919 by Frank S. Land in Kansas City, Mo., and named in honor of Jacques De Molay, the last military grand master of the Knights Templars. The members are pledged to the precepts of love of parents, reverence, patriotism, cleanness, courtesy, fidelity, and comradeship, and to the promotion of the public school system and good citizenship. The order is governed by a grand council of Freemasons, while the chapters are sponsored by Masonic bodies or groups of Masons. However, it is not a junior Masonic fraternity, and more than 60 per cent of its members are from non-Masonic families. In November, 1931, there were about 200,000 members and more than 300,000 former members in 1300 cities of the United States, Alaska, Hawaii, Porto Rico, the Philippines, Canada, Mexico, Chile, Panama, and France. Frank S. Land, the founder, is grand scribe; Dr. Stratton D. Brooks, former president of the Universities of Oklahoma and Missouri, is executive director. International headquarters are at 201 East Armour Boulevard, Kansas City, Mo.

**DENISON UNIVERSITY.** A coeducational Baptist institution of higher education in Granville, Ohio, founded in 1831. The enrollment for the autumn of 1931 was 845 and for the summer session 73. The faculty numbered 65. The amount

of endowment was \$3,368,700; the income for the year was \$351,800. There were 68,050 volumes in the library. The university's centennial anniversary was celebrated Oct. 16-18, 1931; a feature was a gift by the alumni of \$160,000 as an endowment for professors' salaries. President, Avery Albert Shaw, D.D., D.C.L.

**DENMARK.** The smallest of the three Scandinavian states; comprising the peninsula of Jutland with its adjacent islands in the Baltic, the Faroe Islands, a part of Schleswig as a result of the plebiscite of 1920 under the terms of the Treaty of Versailles, and part of Greenland, the only colony or possession. Iceland is a free sovereign state, but united to Denmark under the King of Denmark, who is also head of the government of Iceland. Capital, Copenhagen. King in 1931, Christian X.

**AREA AND POPULATION.** The area is 16,574 square miles, excluding the Faroe Islands, which have an area of 540 square miles; population, according to the census of 1930, 3,542,210, compared with 3,434,555 at the 1925 census. For the five years 1925-29, births averaged 68,894 annually and deaths 38,667 annually. There were 3348 emigrants in 1930, as against 6277 in 1929. The population of the leading cities in 1930, with 1925 figures in parentheses, was: Copenhagen, 771,753 (731,496); Aarhus, 81,517 (76,226); Odense, 56,727 (52,376); and Aalborg, 45,545 (42,819). Between the 1925 and 1930 censuses, Copenhagen increased in population 5.4 per cent, the provincial cities by 4.9 per cent, and the country districts by 2 per cent.

**EDUCATION.** Primary education is free and compulsory between the ages of 7 and 14. Pupils attending elementary and secondary schools during 1928-29 numbered 540,999, while 9213 were enrolled in advanced institutions and agricultural schools, not including the University of Copenhagen, which had about 4900 students, and the University of Aarhus, with about 100 students.

**PRODUCTION.** Agriculture and dairying is of primary importance in Danish economy, agricultural products constituting about three-fourths of the value of annual exports. About 7,000,000 acres, or 66 per cent of the total area, is under cultivation and approximately 92 per cent of all farmers own the land they cultivate. Coöperative dairies and slaughter-houses enrolled 90 and 70 per cent, respectively, of all Danish farmers. Production of the chief crops in 1930 (1929 figures in parentheses) was: Wheat, 10,472,000 bushels (11,772,000); rye, 10,039,000 bushels (10,411,000); barley, 49,743,000 bushels (51,094,000); oats, 71,237,000 bushels (71,276,000); potatoes, 37,037,000 bushels (39,388,000); sugar beets, 1,105,000 metric tons (907,000); beet sugar, 167,000 metric tons (134,000); forage roots, 24,960,000 metric tons (22,309,000); and hay, 1,600,000 metric tons (987,000). In 1930, there were 3,101,000 cattle, 4,928,000 swine, and 516,000 horses. In the same year the output of butter was 419,000,000 pounds (395,000,000 pounds in 1929) and that of bacon was 739,000,000 pounds (553,000,000 in 1929). Agriculture was seriously depressed in 1931, as a result of the continued decline of prices and reduced demand for Danish exports in Great Britain and Germany.

Most of the world's motor ships are built in Danish yards; in 1930 new vessels launched totaled 37, of 137,000 gross tons, including 27 motor ships of 120,000 gross tons. Food products,

cigars and cigarettes, cotton yarn, cotton cloth and articles, cement, bricks, paper and cardboard, oils, and varnishes are other leading industrial products. According to preliminary figures, gross earnings of the Danish merchant marine in foreign traffic during 1930 totaled about 175,000,000 crowns, compared with 206,000,000 crowns in 1929 (1 crown equaled \$0.208). About 12 per cent of the industrial workers were reported unemployed in October, 1931.

**COMMERCE.** Danish foreign trade declined considerably in 1930, particularly in exports. Shipments abroad, not including reexports, totaled 1,518,000,000 crowns (\$406,825,000), as against 1,616,000,000 crowns (\$432,982,000) in 1929; imports amounted to 1,727,000,000 crowns (\$462,765,000), compared with 1,794,000,000 crowns (\$480,677,000) in 1929. Export declines were registered chiefly in live animals, dairy products, hides and skins, clothing, cement, and iron and steel manufactures. Of the general exports in 1930, 58.8 per cent went to the United Kingdom, 16.3 per cent to Germany, and 11.1 per cent to Sweden and Norway. Germany supplied 34.3 per cent of all imports, the United Kingdom 14.5 per cent, the United States 11.2 per cent, and Sweden and Norway 9.4 per cent.

**FINANCE.** The budget for the fiscal year commencing Apr. 1, 1931, as approved by Parliament Mar. 20, 1931, balanced at 410,330,000 crowns (1 crown equals \$0.208 at par). Ordinary revenues were estimated at 330,589,000 crowns and revenues in the capital accounts at 79,741,000 (including an estimated cash reserve of 35,000,000 crowns as of Apr. 1, 1931). Current expenditures were budgeted at 325,714,000 crowns and capital expenditures at 84,616,000 crowns. Closed accounts for the ordinary budgets for 1929-30 and 1930-31 showed surpluses of 12,000,000 crowns and 25,000,000 crowns, respectively. In the 1930-31 budget, current receipts were estimated at 331,096,000 crowns, capital receipts at 50,679,000 crowns, current expenditures at 318,207,000 crowns, and capital expenditures at 70,911,000 crowns. The public debt on Mar. 31, 1930, amounted to 1,354,931,000 crowns (\$363,122,000), including 637,005,000 crowns of internal and 717,926,000 crowns of external debt.

**COMMUNICATIONS.** Railways in operation in 1929 totaled 3258 miles of line, including 1560 miles owned by the state. Highways at the beginning of 1930 extended about 32,000 miles; main trunk roads aggregated 4722 miles. The telegraph system and some telephone lines are government operated, but most of the telephone traffic is privately managed. The Danish merchant fleet on July 1, 1930, comprised 512 steamers of 743,704 tons; and 151 motor ships of 356,451 tons. There were a number of commercial air lines.

**GOVERNMENT.** The Constitution as amended Sept. 10, 1920, vests executive power in the King, who acts through a responsible ministry. Legislative power is vested in the Rigsdag (Parliament), composed of the Folketing (lower house) and the Landsting (upper house). The Folketing has 149 members, of whom 117 are elected on the basis of proportional representation; the Landsting has 75 members, elected indirectly by voters over 35 years of age. The composition of the Landsting after the election of September, 1928, was as follows: 28 Liberals, 27 Socialists, 12 Conservatives, and 8 Radicals.

The Folketing, elected Apr. 24, 1929, consisted of 44 Liberals, 16 Radicals, 61 Socialists, 24 Conservatives, 1 Slesvig (German party), and 3 Georgistic party members. The Ministry as formed in April, 1929, was headed by Th. Stauning, Socialist, who was Prime Minister during 1924-26. Other members were: Agriculture, K. M. Bording; Foreign Affairs, P. Munch; Interior, B. Dahlgaard, Social Affairs, K. K. Steincke; Justice, C. Th. Zahle; Defense, L. Rasmussen; Public Instruction, F. Borghjerg; Ecclesiastical Affairs, N. P. L. Dahl; Public Works, J. F. N. Friis-Skotte; Finance, C. V. Bramsen; Commerce and Industry, C. N. Hauge.

**HISTORY.** The increasing severity of the agricultural crisis in Denmark during 1931 precipitated a new political issue—that of farm relief—which displaced the Stauning government's revolutionary disarmament bill as the chief item of controversy. The dissatisfaction of the farmers early in the summer was indicated by refusals to pay taxes and a growing demand for a moratorium on farmers' debts. Conferences between farm leaders and government officials were held in Copenhagen during July and August, at which the government offered to create a 30,000,000-crown fund to provide extra credit facilities to agriculture. The proposal was rejected as inadequate by the farm organizations, but the government proceeded (September 25) to introduce it in legislative form. While the measure was being debated at length in Parliament, farm leaders in a meeting October 13 prepared to inaugurate a nation-wide agricultural strike to force Parliament to give adequate consideration to their needs. The strike was called off, however, when the farm-relief bill was passed October 19. The fund of some \$6,600,000 was to be used to help farmers meet their mortgage, interest, and tax payments and as grants for long-term loans in case conditions failed to improve. The funds were to be raised by new taxes on beer, incomes, and imports and reductions in military expenses.

The Stauning government's disarmament bill provided for the replacement of the standing army of about 5500 by a neutrality guard of 10,000 men and 6000 reservists, to be mobilized only in case of war. Naval forces were to be drastically reduced. The bill passed the Folketing on Mar. 11, 1931, by a vote of 77 to 64, but as in 1926 was held up in the Landsting. Premier Stauning in February reiterated previous Socialist threats to abolish the Landsting unless it abandoned its practice of vetoing important measures passed by the Lower house.

Denmark abandoned the gold standard on Sept. 28, 1931, following similar action by Great Britain and by Norway and Sweden. Although the finances of the nation were sound, subsequent difficulties in the fluctuating values of foreign exchange caused the Finance Minister to ask authorization to extend the suspension of gold payments until Mar. 19, 1932, and to grant the government far-reaching control over exchange transactions. In the meantime the export of gold was prohibited and, by informal agreement among the banks, foreign exchange was made available only for necessary commercial transactions. Relations with Norway became somewhat strained after the Norwegian government laid claim to part of the northeastern coast of Greenland. The issue was submitted to the World

Court. An agitation in Iceland for the termination of the constitutional union under the Danish King aroused considerable interest in Denmark. See GREENLAND and ICELAND under *History*; NAVAL PROGRESS.

**DENNING, WILLIAM FREDERICK.** A British amateur astronomer and discoverer of comets, died in Bristol June 9, 1931. He was born near Dadstock, Somersetshire, Nov. 25, 1848. Beginning the study of astronomy in 1865, he continued this interest throughout life, although choosing accountancy as his profession. He discovered five comets, some new nebulae, and made a number of planetary observations, the study of the surface markings, rotation periods, and phenomena of Mars, Jupiter, and Saturn especially engaging his attention. He was also one of the first to discover a nova which appeared June 8, 1918, and was absolute discoverer of the new star in Cygnus Aug. 20, 1920. In the field of meteors or shooting stars, where he was a universally recognized authority, he developed the theory of stationary radiants, and his calculations of the heights and velocities of 1220 fireballs and shooting stars during the years 1884 to 1926 enabled meteorologists to obtain important deductions as to the heat of the atmosphere at great altitudes. He was made a Fellow of the Royal Astronomical Society in 1877. In 1895 he received the Valz prize of the Academy of Sciences, Paris, and in 1898 the gold medal of the Royal Astronomical Society. Among his publications are *Telescopic Work for Starlight Evenings* (1891); and *The Planets Mercury and Venus* (1907).

**DENNIS, ALFRED PEARCE.** An American economist, died by suicide at Bailey Island, near Brunswick, Me., Aug. 28, 1931. He was born in Worcester Co., Md., Jan. 10, 1869, and was graduated from Princeton University with the A.B. degree in 1891 and the Ph.D. degree in 1894. He was professor of history at Wesleyan University (Conn.), 1894-95, and at Smith College, 1898-1907. After being engaged in business for several years he was appointed in 1918 commercial attaché at the American Embassy in Rome and in 1921 held the same post in London. As a representative of the U. S. Department of Commerce, he made investigations in central and eastern Europe during 1922-23, and in 1924 became assistant to the Secretary of Commerce, Mr. Hoover. In 1925 he was appointed a member of the U. S. Tariff Commission, and also served as vice chairman of this commission until 1929. He was the author of *The Romance of World Trade* (1926) and *Gods and Little Fishes* (1931), and was a frequent contributor on political history and economics to various periodicals.

**DENVER, UNIVERSITY OF.** A coeducational institution of higher learning in Denver, Colo., founded in 1864. The registration for the autumn of 1931 totaled 2368, distributed as follows: Graduate school, 243; college of liberal arts, 945; school of science and engineering, 150; school of commerce, accounts, and finance, 583; school of law, 87; school of dentistry, 12; school of art, 62; school of librarianship, 34; city college, 252. The summer session in 1931 totaled 1145. The faculty had 203 members. The total assets of the university amounted to \$3,843,838 and consisted of plant assets, \$1,526,097; endowment assets, \$2,129,065; and current assets, \$188,675. The total income for the year was \$550,072. The library contained 75,000 volumes. The new Mary

Reed Library, costing \$400,000 and having a permanent endowment of \$180,000, was under construction during 1931. Chancellor, Frederick M. Hunter, Ed.D., LL.D.

**DEPARTMENT STORES.** See **BUSINESS REVIEW.**

**DEPAUW UNIVERSITY.** A coeducational institution for higher learning in Greencastle, Ind., under the auspices of the Methodist Episcopal Church, founded in 1837. The enrollment for the autumn session of 1931 was 1612, including 973 men and 639 women. Of this number, 1461 were registered in the college of liberal arts and 151 in the school of music. In the summer session of 1931 there were 84 students. The college of liberal arts had a faculty of 94 members and the school of music a faculty of 17. The productive funds of the university amounted to \$5,313,175, including assets of \$2,207,307 of the Rector Scholarship Foundation. The income from productive funds was \$289,731, while the total current income for the year was \$691,578; \$124,410 of the income from productive funds was for scholarships. The total amount of gifts for permanent funds received during the year was \$59,409. During 1931 an addition was made to the Minshall Laboratory at a cost of \$30,000, and \$10,000 was spent on conditioning the athletic fields. The library contained about 73,000 volumes. President, G. Bromley Oxnam, D.D., LL.D., Litt.D.

**DERCUM, FRANCIS XAVIER.** An American neurologist, died Apr. 23, 1931, in Philadelphia, Pa., where he was born Aug. 10, 1856. He received the degrees of M.D. and Ph.D. from the University of Pennsylvania in 1877. In 1887 he became neurologist to the Philadelphia Hospital, and in 1893 consulting physician to the Asylum for the Chronic Insane in Wernersville, Pa. After serving the University of Pennsylvania, from 1883 to 1892, as instructor in nervous and mental diseases, he was appointed professor of the same subjects in the Jefferson Medical College, retiring as professor emeritus in 1925. During the World War he was a member of the Medical Advisory Board, lecturer to the Army and Navy Medical Corps, and member of the Medical Red Cross.

He was a past president of the American Neurological Association, the Philadelphia Neurological Society, and the Philadelphia Psychiatric Society, and at the time of his death was president of the American Philosophical Society. In 1892 he described the disease known as adiposis dolorosa (Dercum's Disease). Besides editing *Text-Book of Nervous Diseases by American Authors* (1895), he was the author of "Rest, Suggestion and Other Therapeutic Measures in Nervous and Mental Diseases," vol. viii of Cohen's *System of Physiologic Therapeutics* (1903); *A Clinical Manual of Mental Diseases* (1913); *Hysteria and Accident Compensation* (1916); *The Biology of the Internal Secretions* (1924); and *The Physiology of the Mind* (1925).

**DETROIT, UNIVERSITY OF.** An institution of higher education in Detroit, Mich., under the auspices of the Roman Catholic Church and conducted by the Jesuit fathers, founded in 1877. In the autumn of 1931 there were 3607 students registered, distributed as follows: Arts and sciences, 497; engineering, 870; commerce and finance, 792; law, 196; foreign trade, 39; Saturday and Thursday extension school, 667. The summer school registration was 546. The faculty numbered 162. The productive funds in 1931 totaled \$1,218,446. There were 61,200 volumes in the library. President, the Very Rev. John P. McNichols, S.J., Ph.D., LL.D.

**DETROIT INSTITUTE OF ARTS.** See **ART EXHIBITIONS**; **ART MUSEUMS.**

**DEUTSCHLAND.** The name of Germany's famous "pocket battleship"—a 10,000-ton armored cruiser, with a fighting power equivalent to that of a 20,000-ton battleship—launched in May, 1931. See **NAVAL PROGRESS**, **GERMANY** under *History*.

**DE VILLIERS, de vil'yērz, SIR JOHN ABRAHAM JACOB.** An Anglo-Dutch historian and cartographer, died Apr. 2, 1931, in London where he was born Sept. 23, 1863. He was educated at the City of London College, was appointed to the British Museum in 1887, and since 1909 had been superintendent of the map division. During 1890-99 he was expert adviser to the British Foreign Office in the Venezuelan boundary arbitration case, and acted in a similar capacity during 1901-04 in the boundary arbitration with Brazil. In 1926 he was cartographical expert in the Labrador boundary arbitration, by the award of which the claim of Newfoundland to 110,000 square miles was allowed. He was knighted in 1927. Sir John was distinguished especially for his researches in Dutch Colonial history, publishing *The Transvaal* (1896); *The Dutch in South Africa* (1923); and *My Memories* (1931) and editing for the Hakluyt Society, of which he was honorary secretary from 1909 to 1923, Storm van's Gravesande's *The Rise of British Guiana* (2 vols., 1911).

**DEWEY, MELVIL.** An American librarian and educator, died at Lake Placid, Fla., Dec. 26, 1931. He was born in Adams Centre, N. Y., Dec. 10, 1851, and was graduated from Amherst College in 1874. In 1876, while acting librarian at Amherst, he published his *Decimal Classification and Relative Index* and founded the *Library Journal*, which he edited until 1881. He also took an active part during 1876-83 in founding the American Library Association (q.v.) of which he was secretary for 15 years and twice president, the Library Bureau for advancing library interests, the Metric Bureau for establishing metric weights and measures, and the Spelling Reform Association. From 1883 to 1888 he was librarian of Columbia College, where he established (1887) a school of library economy. This was transferred to Albany in 1890 as the New York State Library School, Dewey remaining director until 1906. He was from 1889 to 1900 secretary and executive officer of the University of the State of New York, from 1889 to 1906 director of the New York State Library, and in 1904-06 also State director of libraries. He prepared cataloguing rules that are widely used, and his "decimal

classification" has been adopted in most American and in many foreign libraries. He also was active in advocating a simplified spelling. He founded the Lake Placid Clubs in New York and Florida, and in 1922 the Lake Placid Club Education Foundation.

**DIALECTS.** See PHILOLOGY, MODERN; PHILOLOGY, CLASSICAL.

**DIAMONDS.** With the existing world-wide depression, it was inevitable that the diamond industry not only should have a most unfavorable year but should be virtually at a standstill. The Diamond Corporation, Ltd., referred to in the 1930 YEAR BOOK, was aiming at a gradual liquidation of its stocks, and the DeBeers Company, one of the largest producers, decided to abandon sending fresh diamonds to London before June, 1932. After the abandonment of the gold standard in Great Britain, it was decided by the Diamond Corporation, Ltd., that diamond transactions would continue on a gold basis and an agreement to that effect was made also with the Union of South Africa, where during the year the mines were virtually stopped in order to check overproduction. In Amsterdam, the leading diamond centre of the world, there was general unemployment in the industry, 4500 diamonds workers being estimated out of work in a total membership of 6000 in the General Association of Dutch Diamond Workers.

The Diamond Corporation, Ltd., was able, during the year, to maintain the price level of rough diamonds through its agreement with the government of South Africa and the large diamond mining companies. However, the showing of rough diamonds was curtailed and after October restricted to twice a week with a written request necessary. There was a reduction in prices of bort, an impure variety of diamonds used largely for cutting and polishing, which later was stabilized at 305 guilders or about \$1.20 a carat.

The prevalence of unfavorable economic conditions in the United States naturally reduced the world market as that country was the largest purchaser of cut diamonds, and figures for the year 1931 indicated imports totaling 201,998 carats valued at \$11,064,820 as against 295,351 carats valued at \$23,267,296 in 1930. In 1931, rough, uncut diamonds, which were admitted free, were imported to the amount of 85,249 carats valued at \$3,851,698 as compared with 83,525 carats valued at \$1,464,549, dutiable, admitted before June 18, 1930, and 120,066 carats valued at \$4,176,240 admitted after that date free, in 1930. Belgium, with Antwerp as a centre, continued the leading source of diamonds for the United States, the 1931 imports of cut diamonds amounting to 146,412 carats valued at \$7,981,246, followed by The Netherlands, with Amsterdam as the main supply, with 48,608 carats valued at \$3,168,263.

At the end of 1931 many in the diamond industry were hopeful that the reduced prices of cut diamonds would lead to their being accumulated for investment and appreciation in view of the depreciation of currency and stocks.

**DIBELIUS, WILHELM.** A German philologist, died Jan. 28, 1871, in Berlin where he was born Apr. 23, 1876. He successively held professorships in Posen (1903-11), Hamburg (1911-18), Bonn (1918-25), and Berlin (1925-31). As a specialist on English language and literature, his principal works are *John Capgrave und die*

*englische Schriftsprache* (1899); *Englische Romankunst* (2 vols., 1910); *Charles Dickens* (1916); and *England, Its Character and Genius* (2 vols., trans., 1923).

**DINKEY, ALVA CLYMER.** An American industrialist, died in Wynnewood, Pa., Aug. 11, 1931. He was born in Weatherly, Pa., Feb. 20, 1866. After receiving an elementary education he became connected with the Carnegie steel interests in Pennsylvania, serving in various positions with the Edgar Thomson Steel Works, the Pittsburgh Locomotive Works, the McTighe Electric Company, and as general superintendent of the Homestead Steel Works (1901). In 1903 he became president of the Carnegie Steel Company, but resigned in 1915 to accept the presidency of the Midvale Steel & Ordnance Co., reorganized in 1923 as the Midvale Company. He was a director of the American Iron and Steel Institute.

**DISARMAMENT.** In the field of disarmament, attention was centred during 1931 upon preparations for the Disarmament Conference, scheduled to open Feb. 2, 1932, in Geneva. Much of the groundwork for the conference had been laid by the Preparatory Disarmament Commission, established under League auspices in 1925. After five years of labor the Preparatory Commission on Dec. 9, 1930, completed the drafting of a skeleton agreement for the limitation and reduction of land, naval, and air forces. To the 1932 Disarmament Conference was left the task of filling in the actual figures at which armaments were to be limited. The Conference was also faced with the problem of reconciling more than 50 reservations made to various provisions of the draft disarmament treaty by delegations of different countries represented on the Preparatory Commission. Germany advanced 20 objections or reservations to the draft treaty, while the Soviet Union reserved the right to propose its own plan at the Disarmament Conference.

On Jan. 24, 1931, the Council of the League of Nations formally invited the governments of the world, including the United States, Soviet Russia, and other non-members of the League, to participate in the Disarmament Conference. With the acceptance of this invitation, the various governments and the League Secretariat commenced the work of formulating their respective programmes for the Conference and of smoothing out the numerous technical and political differences which stood in the way of a final agreement. These problems were among the most important issues discussed during the numerous exchange visits of premiers and foreign ministers among the capitals of Europe and the United States during 1931. League committees continued their work on specific problems. On February 23, the committee of experts working on budgetary limitation of armaments concluded the drafting of a model statement by which armament expenditures of the various countries could be shown in a simple and comprehensive form. To participate in this preliminary work, the U. S. Department appointed a representative

to the disarmament section of the League of Nations Secretariat.

During the spring, the League Council formally requested the various governments to submit figures on their respective armaments in a schedule form drawn up by the Preparatory Commission. These figures were to be used to calculate figures to be inserted in the Draft Treaty as a basis for discussion at the Disarmament Conference. At the same time the Council asked for such information and suggestions as would facilitate the work of the Disarmament Conference. The most important of the replies received was the French memorandum of July 21, 1931, which led many observers to declare that the Disarmament Conference was doomed to largely futile negotiation. The memorandum advanced the familiar French thesis that security must precede disarmament, as contrasted with the stand of the United States, and other powers, that the previous limitation and reduction of armaments was the most effective road to security. It was plainly stated that France had cut her armaments to an irreducible minimum under existing conditions of security in Europe, and that any further reduction was conditioned upon an international agreement for immediate and effective military financial, and economic aid to a nation attacked by an aggressor. Furthermore, the French government warned, any increase in Germany's armaments intended to give Germany theoretical equality with the other powers would force France to increase her existing armaments.

Shortly after publication of the French memorandum, Joseph Paul-Boncour, chairman of the Foreign Affairs committee of the French Chamber, proposed that the defense forces of each country as fixed at the Disarmament Conference should become a police force under the direction of the League. His proposal was coldly received in the European capitals not allied with France. In a speech on December 20, Premier Laval stated that, if necessary, France would introduce at the Disarmament Conference a plan for military help to nations menaced by aggression. On the same day, Lord Cecil of Chelwood, who headed the British delegation to the Preparatory Commission, urged that the Disarmament Conference admit the principle of armament equality demanded by Germany, while at the same time barring to all nations the weapons denied to Germany under the Peace Treaties, such as aircraft and submarines.

**THE ARMAMENTS TRUCE.** A proposal was made by Foreign Minister Grandi of Italy before the League Assembly Sept. 8, 1931, for "a suspension of the execution of the new armament programmes until after the Disarmament Conference." The proposal was referred to the Third Commission of the Assembly on disarmament, where on September 30 it was adopted in a denatured form, the modifications being due largely to the objections raised by France, Poland, and Japan. The American Minister to Switzerland, Hugh R. Wilson, sat with the Third Commission during the discussion "in a consultative capacity." The Council then requested the various governments to state before Nov. 1, 1931, whether they were prepared to accept the proposed armaments truce for a period of one year. By November 5, 38 governments, including the United States and the Soviet Union, reported favorably. The truce was placed in effect by the United States and a number of other governments with-

out awaiting the formal declaration of the League. On Nov. 16, 1931, the League Secretariat informed the powers that the truce was in effect for one year, commencing Nov. 1, 1931.

**DISARMAMENT PROPAGANDA.** Toward the end of 1931, considerable sentiment in favor of the postponement of the 1932 Disarmament Conference became evident in French and other governmental circles, as well as among students of world politics, who felt that the time was extremely inopportune. It was pointed out that the French memorandum, the Manchurian crisis, the reparation negotiations, and the critical financial and political situation in Europe, made it not unlikely that the debates at the Conference would increase rather than ameliorate nationalistic antagonisms. No government, however, dared incur the onus of proposing the postponement of the conference, while leaders of the German government flatly opposed postponement. The peace societies in all civilized countries had carried on intensive propaganda on behalf of disarmament, which statesmen hesitated to appear to oppose. Petitions urging immediate arms reductions, had been widely circulated. Pope Pius XI, President Hoover, and other religious and political leaders in many countries had declared the limitation and reduction of armaments to be one of the most vital political and economic problems of the generation. In an encyclical issued during the year, addressed primarily to Bishops of the Church, Pope Pius said:

Since the unbridled race for armaments is on the one hand the effect of the rivalry among nations and on the other the cause of the withdrawal of enormous sums from the public wealth and hence not the smallest of contributors to the current extraordinary crisis, we can not refrain from renewing on this subject the wise admonitions of our predecessors which thus far have not been heard. We exhort you all, that with all the means at your disposal, both by preaching and by the press, you seek to illumine minds and open hearts on this matter according to the solid dictates of Right reason and of the Christian law.

In a statement addressed to President Hoover, 66 officials and members of 38 national organizations in the United States urged that the Government exert every influence to insure the success of the Geneva parley. With the object of making known the facts of the armament situation, an *International Disarmament Review* was established in Geneva. The movement for disarmament met a decided setback in Paris, however, when an unofficial international disarmament conference was convened there in November, attended by more than 1000 delegates from peace societies in 30 countries. Some of the delegates were indiscreet enough to hiss Paul Painlevé, former French Premier and liberal leader, when he defended the French official thesis of security before disarmament. The following night (November 27) a great mass meeting for disarmament in the Trocadero Palace was thrown into pandemonium by French nationalist agitators and the aroused French public. Lord Cecil of Great Britain, former Premier Herriot of France, Vittorio Scialoja, head of the Italian delegation to the League of Nations; and Alanson B. Houghton, former American Ambassador to Germany and Great Britain, were among the prominent peace advocates howled down by the mob. The Paris press, with a few exceptions, condoned the breaking up of the meeting. The general sentiment expressed was that the conference had been called by the peace organizations in Paris "to

force upon France a solution unfavorable to our country."

Jacobs, *World Peace and Armaments* (London, 1931); Major Victor Lefebure, *Scientific Disarmament* (New York, 1931); Vittorio Scialoja, "Obstacles to Disarmament," *Foreign Affairs*, January, 1932; Viscount Cecil, "Facing the World Disarmament Conference," *Foreign Affairs*, October, 1931; William T. Stone, "The Draft Treaty for the World Disarmament Conference," *Foreign Police Association Information Service*, Feb. 18, 1931, Vol. VI, No. 25. The report of the Preparatory Disarmament Commission together with the Draft Disarmament Convention was published in 1931 by the British Government Stationery Office as Command Paper 3757.

**DISCIPLES OF CHRIST.** A communion known also as the Churches of Christ and sprung from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the nineteenth century, under Barton W. Stone, in Kentucky, and Thomas and Alexander Campbell in Western Pennsylvania. This is the largest religious body having its origin in America. It was fifth among Protestant communions in the United States in 1931. In policy the churches are congregational. There were six major agencies of the communion in 1931: The United Christian Missionary Society; Board of Education; Board of Temperance and Social Welfare; Association for the Promotion of Christian Unity; Pension Board; besides the missionary societies of the several states and provinces of Canada. These agencies are corporations and are related in an advisory way to the International Convention of the Disciples of Christ which meets annually in the late summer or early autumn. The general missionary work of the churches is organized under the United Christian Missionary Society, with headquarters at 222 Downey Avenue, Indianapolis, Indiana. Its board of managers of 120 is composed of an equal number of men and women. The foreign missionary work in 1931 embraced the Belgian Congo, Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Porto Rico, Argentina, Paraguay and Tibet (Batang, on the border).

Statistics of the denomination show that during the year there were 7148 baptisms in the foreign fields. The 527 mission schools had a total enrollment of 16,202. The communion maintained 16 hospitals and 19 dispensaries which gave 431,261 treatments, a decrease of 32,456 over the previous year. The church erection fund amounted to \$2,820,459.78. The Society maintained Bible chairs in four State universities; and 60 young people's conferences were held, a gain of one over the previous year. Work in America was conducted among the French, Highlanders, immigrants, Negroes, Orientals, Spanish-Americans and Mexicans. The department of benevolence maintained six homes for children, an equal number of homes for the aged and one hospital. In 1931, 29 colleges coöperated with the Board of Education.

The total church membership throughout the

world in 1931 was 1,679,768, a gain over 1930 of 9332; and in the United States and Canada, 1,549,754, a loss of 4924. The Bible school enrollment for the world was 1,134,772, a gain over the previous year of 6170; and for the United States and Canada, 1,050,141, a gain of 606. Contributions, missionary, benevolence, and educational, reported for the fiscal year in the United States and Canada totaled \$3,309,638.71. Among the periodicals published by the communion are *World Call*, *Christian Evangelist* and *Christian Unity Quarterly*. The president of the International Convention for the year was L. D. Anderson of Fort Worth, Texas. Dr. Stephen J. Corey of Indianapolis, Indiana was president of the United Christian Missionary Society.

**DODSON, JOHN E.** An American actor, died in New York City, Dec. 9, 1931. Born in England in 1857, he came to the United States with the Kendals in 1880 and was especially known in character parts. He made his debut in 1877 at Manchester with J. L. Toole in *The Spelling Bee*. Later he played for several seasons at Dublin and in different British cities, supporting, among others, Charles Mathews, Barry Sullivan, Joseph Jefferson, and J. K. Emmett. One of his creations was Carraway Bones in *Turned Up*. After he joined the Kendal company he appeared in *A Scrap of Paper*, *The Ironmaster*, *The Squire*, *The Second Mrs. Tanqueray*, *Still Waters Run Deep*, and other productions. In 1894 he became a member of Charles Frohman's company, playing in *The Masqueraders*, *John-a-Dreams*, and other plays. In 1898 he made a hit as old John Weathersby in Gillette's farce, *Because She Loved Him So*.

**DOGS.** Pendley Calling, wire-haired fox terrier owned by John G. Bates of Morristown, N. J., established herself as among the greatest dogs in the history of the show ring, in 1931. Against strong opposition she went through to win the title of Best-in-Show at the Westminster Kennel Club show at Madison Square Garden in February for the second time in succession. The competition was keen and it was only after the greatest of rivalry and demonstrations of approval and disapproval by the spectators that she won the ribbon over Blue Dan of Happy Valley, the magnificent English setter owned by Dr. A. A. Mitten of Philadelphia. The judging was questioned later in many written protests but the award was upheld and the shadow lifted when Pendley Calling took the honors at the Canadian show at Toronto in November. Blue Dan of Happy Valley must be given second honors through the year, not only for his brilliant showing in the Westminster classic but because of his incessant and brilliant triumphs in the smaller shows. Dog show competition did not appear to feel the economic crisis. There was no let-up in shows and with record entry lists almost as many shows were held in 1931 as in previous years; 55,000 dogs were benched during the year. The only indication of the financial condition was to be found in the lessening of importations of important dogs. But since the importations of other years have produced stock in this country which seems to be every bit as good as that of

the European breeds there is less and less need for such activity in the matter of importing, and dog fanciers were concentrating on their own.

**DOHERTY, CHARLES JOSEPH.** A Canadian lawyer and statesman, died in Westmount, Que., July 28, 1931. He was born in Montreal, May 11, 1855, and was educated at St. Mary's Jesuit College and at McGill University, being graduated from the latter with the B.C.L. degree in 1878. Called to the Quebec bar in 1877, he soon gained a large practice and in 1887 was created Queen's Counsel. He also became professor of civil and international law at McGill University and was a member of the Royal Commission appointed in 1883 to investigate the working of the Protestant and Catholic school boards in Montreal. In 1891 he was appointed a puisne judge of the Superior Court of Quebec, serving until 1900. From 1908 to 1911 he was a member of the House of Commons for the St. Ann's division of Montreal and actively supported Robert Laird Borden, the Conservative leader, in opposing the Liberal policy of reciprocity with the United States. On the election of Borden as Premier, in 1911, he was appointed Minister of Justice, holding this office until the fall of the Conservative government in 1921. During the World War period he had the difficult task of administering the Conscription Act. He was also one of the Canadian delegates to the Paris Peace Conference and to the League of Nations during 1920-21, and in 1920 was made an Imperial Privy Councillor.

**DOLE.** See UNEMPLOYMENT; LABOR, AMERICAN FEDERATION OF. FRANCE; GREAT BRITAIN; GERMANY.

**DOMINICA.** See LEEWARD ISLANDS.

**DOMINICAN REPUBLIC (SANTO DOMINGO).** A West Indian state occupying the eastern part of the island of Haiti, the western part of which comprises the Republic of Haiti (see HAITI). Capital, Santo Domingo.

**AREA AND POPULATION.** The area is estimated at 19,332 square miles; the population at the census of 1921 was 897,405 (estimated at 1,200,000 in 1929). The chief cities, with their estimated populations in 1929, were: Santo Domingo, 45,000; Santiago, 15,000; San Pedro de Macoris, 31,000; Puerto Plata, 9500; La Romana, 10,000. Of the total population in 1927, 25 per cent were white (mainly of Spanish descent), 25.4 per cent were Negroes, and the remainder were mestizos or yellow. In February, 1930, there were 841 schools, of which 33 were technical, and a total enrollment of 90,366 (average attendance, 55,842), or about one-half the children of school age. Approximately 20 per cent of the population were illiterate in 1930. The language of the country is Spanish.

**PRODUCTION.** Agriculture is the predominant industry, with sugar, cacao, coffee, and tobacco as the chief crops. About 8,000,000 acres, or two-thirds of the total area, is suitable for cultivation. Sugar production during the 1930-31 grinding season was 406,237 short tons (396,000 tons in 1929-30). Sugar normally constitutes about 55 per cent of the value of all exports. Yields of other crops were: cacao, 50,000,000 pounds (estimated) in 1931 and about 45,000,000 pounds in 1930; tobacco, about 29,000,000 pounds in 1930; coffee, about 12,000,000 pounds in 1930 and 13,000,000 pounds in 1929; rice, 16,500 short tons (estimated) in 1931. Approximately \$2,000,000 worth of rice is imported annually.

Livestock in 1930 included about 900,000 cattle, 1,100,000 swine, 150,000 horses, 150,000 asses, 45,000 mules, 650,000 goats, and 5000 sheep. The forests produce lignum-vitæ, mahogany logs, railroad ties, and dyewoods. Sugar refining is the only important manufacturing industry; straw hats, cigarettes, soap, etc., are produced for local consumption. Agriculture and business were badly depressed in 1931, as a result of the fall of agricultural prices, adverse crop conditions, the destruction of Santo Domingo by the September, 1930, hurricane, and the continuance of political unrest.

**COMMERCE.** General imports in 1930 were valued at \$15,229,000, compared with 22,729,000 in 1929, a decline of 33 per cent. General exports were valued at \$18,552,000, as against \$23,736,000 in the previous year, a 22 per cent decrease. Due entirely to lower prices, raw sugar exports declined 19 per cent in value—from \$12,259,000 in 1929 to \$9,910,000 in 1930. Cacao shipments declined only 3 per cent in volume but 30 per cent in value, the totals being \$3,870,000 and \$2,710,000 for 1929 and 1930, respectively. Coffee exports were \$1,483,000 in 1930 (\$2,444,000 in 1929); leaf tobacco, \$1,032,000 in 1930 (\$1,381,000). The United States, including Porto Rico, supplied 56.8 per cent of all imports in 1930 (59.5 in 1929) and took 32.2 per cent of all exports (30.9). The United Kingdom purchased 39.5 per cent of the exports and France 13.2 per cent.

**FINANCE.** In the budget for 1931, as passed by Congress in December, 1930, revenues were estimated at \$12,094,870 (including \$5,463,457 apportioned to the special fund) and expenditures at \$9,957,662 (including \$4,961,557 for special purposes). The sum of \$2,892,917 was set aside for service of the debt. Budget estimates for 1930 were: Revenues, \$14,292,210; expenditures, \$14,042,098, or \$4,084,431 more than in the 1931 budget. While actual results were not available, deficits were indicated for both years. Customs receipts for 1930 amounted to \$3,594,567, compared with \$4,989,527 in 1929. Payments toward the debt sinking fund absorbed \$2,345,119, or 65.24 per cent of all customs receipts. When costs of the receivership were deducted, there remained but \$848,870 for transfer to the Dominican government, as compared with \$3,461,814 for 1929. Dominican customs are supervised by the U. S. State Department, under the treaty of 1924. The external public debt on June 30, 1931, totaled \$17,283,000, compared with \$19,684,000 at the end of 1929.

**COMMUNICATIONS.** In 1930, there were 149 miles of railway line, of which 62 miles were government owned, and 845 miles of highways, including 686 miles of macadam. The Pan-American Airways operated a tri-weekly service from Santo Domingo to San Juan, Porto Rico, and from Santo Domingo to Miami via Camaguey, Cuba. It was announced that the air company would change its base from Santo Domingo to San Pedro de Macoris on Dec. 1, 1931. A total of 1687 vessels, of 2,382,000 net registered tons, entered the ports in 1930, and 1509 ships, of 2,218,000 tons, cleared. Direct radio-telegraphic service between Santo Domingo and the United States was inaugurated Dec. 24, 1930.

**GOVERNMENT.** The Republic is governed under a constitution adopted by the Constituent Assembly on June 13, 1924, and revised in 1927 and 1929. Executive power is vested in a presi-

dent and cabinet of seven ministers. The President is ineligible for a second successive term. The senators, deputies, and governors of the Provinces are elected for four years by direct popular vote. Each of the 12 Provinces is represented by one senator and (in practice) by two deputies. The President of the Republic in 1931 was Gen. Rafael Leonidas Trujillo y Molina, who assumed office Aug. 16, 1930, following a successful revolution against the administration of President Horacio Vásquez.

**HISTORY.** The tightening of the economic depression during 1931 created a serious unemployment problem and forced general reductions in wages and personnel among both private and government employees. Government revenues, derived largely from duties on imports, declined steadily until November, when it became necessary to declare a moratorium with respect to amortization payments on the government's foreign debts. The moratorium, which was approved by the U. S. State Department, provided for the continuation of interest payments. Industrial establishments operated at about 50 per cent of capacity throughout the year. In an effort to tide the government over the financial crisis, Congress on July 17, 1931, authorized the President to float a \$5,000,000 bond issue. The proceeds were to be applied to the cancellation of the floating debt and pending claims, payment of debts incurred as a result of the 1390 hurricane, and for public works.

Aggravated by the depression, the political unrest which flared out in revolution in 1930 continued throughout 1931. President Trujillo's régime proved unable to stamp out revolutionary bands in the Provinces. A number of his supporters were killed during sporadic disorders, including Jesus Gomez, a member of the Land Tribunal, and Senator Desiderio Ariay. Factionalism became evident within the government and when Vice President Estrella Ureña sailed in August, 1931, for a vacation in the United States and Europe, it was predicted that he would not return while President Trujillo retained power. This prediction was verified on December 7, when the Chamber of Deputies voted to impeach the Vice President on charges of conspiring against the government. Dr. Estrella Ureña's whereabouts were then unknown.

Three bills approved by Congress in an extraordinary session convened Jan. 26, 1931, reduced the number of Cabinet ministries from 10 to 6, leased the national lottery for 10 years to a Dominican citizen, and authorized the President to lease the government-operated Central Railway and the aqueduct and telephone system in Santo Domingo to a national or foreign corporation. The reorganized cabinet was constituted as follows: Presidency, Dr. Rafael Vidal; Interior, Police, War, and Navy, Dr. Jacinto B. Peynado; Foreign Affairs, Dr. Rafael Estrella Ureña; Finance, Labor, and Communications, Dr. Teódulo Pina Chevalier; Agriculture and Commerce, Dr. R. César Tolentino; Health, Social Welfare, and Public Works, Dr. Fiallo Cabral (Dr. Cabral died Mar. 20, 1931, and was succeeded by Dr. Rafael Vidal as *ad interim* secretary).

An international committee of three architects in 1931 accepted the design submitted by J. L. Gleave of England for a \$1,500,000 light-house to be erected in Santo Domingo under the auspices of the Pan American Union as a

memorial to Christopher Columbus. See **ARCHITECTURE**.

**D'ORSAY, LAWRENCE** (DORSET WILLIAM LAWRENCE). A British actor, died in London, Sept. 13, 1931. He was born in Northamptonshire, Aug. 19, 1853. After making his stage début in 1877, he toured the provinces, returning to London in 1882 to appear as Lord All-Cash in *Fra Diavolo*, the type of character-rôle for which he became famous. He later supported Minnie Palmer in *My Sweetheart in London* and played Lord Dangars in *The Profligate* and the Earl of Thamesmead in *An Artist's Model*. In 1900 he went to the United States, where he remained until 1924, appearing as the Earl of Pawtucket in the play of that name (1903-05), Capt. Howard Kellie in *The Embassy Ball* (1905-07), Capt. Cecil Fitz Herbert in *The Lancers* (1907), Captain Montjoy in *Miss Innocence* (1908), Captain Foenix in *Trelawney of the Wells* (1911), Archduke Frederick in *The Whirl of Society* (1912), The Earl of Carmondale in *The Rented Earl* (1914), Captain Chichester in *Robinson Crusoe, Junior* (1916), the King of Serendib in *Sinbad* (1918), and Sir Percy Beauchamp in *So This Is London* (1922). He last appeared in London in *Othello*, in 1930.

**DORSEY, GEORGE AMOS.** An American anthropologist and author, died in New York City, Mar. 29, 1931. He was born in Hebron, Ohio, Feb. 6, 1868, and was graduated from Denison University in 1888 and from Harvard University with the Ph.D. degree in 1894. During 1891-92 he conducted anthropological investigations in South America for the Chicago Exposition and also acted as superintendent of archaeology in the department of anthropology. After two years of teaching in the department of anthropology at Harvard, he became assistant curator of anthropology (1896) at the Field Museum of Natural History in Chicago, and acted as curator from 1898 to 1915. As a result of his travels in Europe, Africa, Asia, and Australasia in 1908 the museum's anthropological collections were greatly augmented. He also served as professor of comparative anatomy in the dental school of Northwestern University (1898-1913) and as assistant professor of anthropology (1905-08) and associate professor (1908-15) at the University of Chicago. From 1909 to 1912 he was a member of the editorial staff of the *Chicago Tribune*, investigating sources of European emigration and studying political conditions in India, China, Japan, Australia, and South Africa.

During the World War Dr. Dorsey was lieutenant in the U. S. Naval Reserve, serving as assistant naval attaché at Madrid in 1918 and naval attaché at Lisbon in 1919. He was also adviser on Spanish problems to the American Commission to Negotiate Peace at Paris in 1919. In 1922 he resumed his interest in journalism as correspondent for the London *Evening News*, and on his return to the United States, aside from lecturing at the New School for Social Research in New York City, devoted his entire time to writing. He was the author of *Young Low* (a novel, 1917); *Why We Behave Like Human Beings* (1925); *The Nature of Man* (1927); *The Evolution of Charles Darwin* (1927); *How and Whys of Human Behavior* (1929); and *Man's Own Show: Civilization* (posthumous, 1931). He had also published more than 70 papers on anthropology and anatomy.

**DOURINE.** See VETERINARY MEDICINE.

**DRAKE UNIVERSITY.** An institution for the higher education of men and women in Des Moines, Iowa, founded in 1881. The number enrolled in the autumn of 1931, was 1481, distributed as follows: College of liberal arts, 483; commerce, 296; education, 304; law, 86; fine arts, 266; and Bible, 27. The summer session registration was 546. The faculty numbered 99. The fixed endowment amounted to \$1,363,676. The number of volumes in the library was 53,029. President, Daniel W. Morehouse, Ph.D.

**DRAMA.** See THEATRE; GERMAN LITERATURE; FRENCH LITERATURE; LITERATURE ENGLISH AND AMERICAN; ITALIAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH-AMERICAN LITERATURE; SPANISH LITERATURE.

**DRAPER, DANIEL.** An American meteorologist, died in Hastings-on-Hudson, N. Y., Dec. 21, 1931. He was born in New York City, Apr. 2, 1841, a son of John William Draper under whom he studied science. He obtained the Ph.D. degree from New York University in 1880. He helped his brother, Henry Draper, to construct the telescopes, grind the mirrors, and build his observatory at Hastings-on-Hudson. From 1869 to 1911 he served as director of the New York City Meteorological Observatory. The self-recording meteorological instruments employed in that institution are based chiefly upon his designs.

**DUKE UNIVERSITY.** An institution for higher education in Durham, N. C. It had its beginning under the name of York Academy, established in 1835 in Randolph County, N. C., and expanding later into Union Institute, then into Normal School, and in 1858 into Trinity College. In 1892, Trinity College was moved to Durham where it continued under that name until 1924, when the greater Duke University was made possible through benefactions from James B. Duke.

The enrollment for the autumn of 1931 was 2666, distributed as follows: Undergraduate men, 1436; undergraduate women, 583; school of religion, 145; school of law, 75; school of medicine, 147; other graduate schools, including arts and sciences, 233; school of nursing, 60; duplications, 13. For the summer session of 1931 there was an enrollment of 1363. In the autumn of 1931 the faculty, including officers, numbered 252. In addition there were 25 teachers in the 1931 summer school who were not included on the regular staff of the university.

The endowment funds of the university amounted to \$23,278,041, and the income for the year was \$1,147,117. Gifts received during the year 1930-31 amounted to \$100,000. The Angier B. Duke memorial student loan fund exceeded \$1,250,000 in value. The library contained 246,280 accessioned volumes and above 40,000 catalogued volumes. President, William Preston Few, Ph.D., LL.D.

**DUTTON, BROTHER JOSEPH** (IRA BARNES DUTTON). A lay missionary of the Roman Catholic Church, died in Honolulu, T. H., Mar. 26, 1931. He was born in Stowe, Vt., Apr. 27, 1843, and removing to Wisconsin served with the 13th Wisconsin Volunteers during the Civil War, being appointed first lieutenant and assistant quartermaster. For ten years after the war he was in the government service, principally in the adjustment of war claims. During this period he became a convert to the Roman Catholic Church, and entered the Trappist monastery at Gethsemane, Ky. After taking his final vows he went to New Orleans where he learned of the work among the lepers of Father Joseph Damien, the heroic Belgian priest. In 1886 he sailed for Honolulu where he presented himself to the Superior of the Hawaiian Catholic Missions as "a gift to the lepers" and joined Father Damien at the leper settlement on Molokai. On Father Damien's death three years later he took over the administrative work of the settlement and instituted, among other important projects, the Baldwin Home at which more than 1300 leprosy men and boys were cared for. In 1929 he received the thanks of the Hawaiian House of Representatives for his inspiring work and service.

**DYNAMO ELECTRIC MACHINERY.** The unfavorable business conditions of 1931 had the effect of slowing up the development of large size units and to discourage the tendency to break records for size, but the conditions seemed to stimulate activity in the production of more ingenious improvements and refinements in design which would bring about more efficient and economic operation and lessen costs of operation, particularly in machines of small and moderate capacities. The type of turbo-electric generator for 1800 r.p.m., built as one machine on one shaft and known as a "single cylinder machine," took two steps upward in maximum size available, i.e. an 80,000 kw. machine for Buffalo and a 200,000 kv-a. 160,000 kw. machine for Brooklyn. The latter is designed to operate at 400 lbs. steam pressure at 730° F. and the generator has the new type of "double winding" first introduced in the generator for the N. Y. Edison Company at the East River Station.

The 110,000 kv-a. turbo-generator operating with a steam pressure of 1200 lbs. mentioned in the 1929 YEAR BOOK was put in successful operation. This is a double shaft machine, each running at 1800 r.p.m. with one turbine on top of the other in order to save floor space.

A number of smaller sets designed to operate at 1200 lbs. steam pressure were put in operation including a couple for 50,000 kv-a. An increase in the size of turbo-generators operating at a shaft speed of 3600 r.p.m. is noted in a 22,500

1. One of the 77,000 kva Water-Wheel Generators for the Diablo Power Station  
*From Westinghouse Electric and Manufacturing Co*
2. The 77,500 kva Water-Wheel Generator for the Dnieper River Project, Russia  
*From General Electric Co*

**DYNAMO ELECTRIC MACHINERY**

1. The 70,000 kva Three-phase Transformer for the Hell Gate Station, New York  
*From Westinghouse Electric and Manufacturing Co*

2. A 3000 kw. mercury arc rectifier for supplying power at 3000 volts direct current from an alternating  
 current transmission system For the Delaware, Lackawanna and Western R. R.  
*From General Electric Co.*

## DYNAMO ELECTRIC MACHINERY

kv-a. machine for New Jersey which operates at 600 lbs. steam pressure.

It has been found more economic to design these large electric generators in sizes of 100,000 kw. and greater for a voltage of 18,500 and 22,000 at their terminals, and as such designs have given satisfaction in service this has become standard practice.

The largest generators in the world (in bulk and weight) for the Dnieper installation in Russia were shipped and installed. These are for 77,500 kv-a. at 88.2 r.p.m., weigh 880 tons each, and are driven by water wheels. Some other water-wheel generators for 77,000 kv-a. were installed at the Diablo plant near Seattle, but these were for 171 r.p.m. and are of lesser bulk and weight. However, 77,500 kv-a. is a record for capacity of water-wheel driven generators.

The largest synchronous condenser yet built was one for 75,000 kv-a. at 514 r.p.m. installed in Chicago. It is connected by transformers to the 220,000-volt transmission system and serves to stabilize and regulate the system voltage. Another 50,000 kv-a. synchronous condenser is noteworthy because it is cooled by hydrogen instead of air.

A notable novelty is the installation of two 21,000 kv-a. frequency changers for the Reading Railway. They take power at 60 cycles three phase from a commercial transmission system and deliver power at 11,000 volts, 25 cycles single phase for the operation of the locomotives and trains. The novelty consists in the two facts that they are designed to operate outdoors and they are the largest single phase frequency-changers in operation.

The size of high frequency generators for the operation of induction furnaces was increased to 1250 kw. at 960 cycles. A direct current motor for 8000 h.p. for a steel mill of the Illinois Steel Co. broke another record for size.

There was an intensive development in transformers which included an increase in the maximum unit capacity to 70,000 kv-a. in a three phase 60 cycle oil and air cooled transformer for New York City. There was a large increase in the application of special high-voltage transformers of the "non-resonating" or "surge-proof" type, which features render them less susceptible to trouble from lightning and high-voltage surges. Many of these were used on 230,000 volt transmission systems in sizes up to 67,000 kv-a.

The use of transformers with "load-ratio control" for the control of the secondary voltage very materially increased. These transformers operate without attendants.

Among the minor ingenious improvements for transformers were: The Thermotol, an instrument for indicating the extent to which the available capacity of all the transformers of a system is being used. A system of "banked radiators" for the cooling of a number of large transformers in a restricted space. A combination of oil-air pressure for the more effective cooling of large transformers.

The development and the application of Mercury Arc Rectifiers has been very vigorously pushed in recent years and there has been a very great increase in the number, size, and power capacity. The direct current systems in which they are used range from 600 to 3000 volts and their capacities from 750 kw. to 6000 kw. and for all commercial frequencies. The largest in-

stallation is probably that of the New York City Board of Transportation, intended to supply power to the new subways, particularly the Eighth Avenue Subway.

**EARTH.** See GEOLOGY; ASTRONOMY; METEOROLOGY.

**EARTHQUAKES.** On the average, an earthquake is felt in some part of the world at least 4000 times each year, though fortunately the vast majority of these quakes either are feeble and harmless or else occur under the sea or in thinly populated regions; in the United States alone, 200 or more are usually reported annually. The year 1931 had the usual quota of earthquakes, several of which ranked as severe disasters; forty-three major quakes occurred during the first four months of the year alone, but several of these took place in midocean, and a number of the others did not cause much damage or loss of life. A great quake in China on January 27, was known to have occurred only from the records made by seismographs over the globe.

A destructive earthquake took place in the south of Mexico (q.v.), on January 14, and was followed by aftershocks for several days; the epicentre was close to the coast of the Gulf of Tehuantepec. Oaxaca was almost completely destroyed, with a loss of about sixty lives; considerable damage was caused at Mexico City, 230 miles from Oaxaca.

On February 3, an intense quake in North Island, New Zealand, caused part of the city of Napier to collapse; the epicentre was under the ocean, near Napier, and the shock was followed by a sea wave. Many aftershocks occurred, notably on February 13. Over 250 lives were lost. Napier and Hastings were the most heavily damaged cities, but destruction occurred over an area 12 or 15 miles wide and 45 miles long, parallel to the coast. The bed of the harbor at Napier rose as much as 18 feet in some places. Notable displacements of the earth's crust have been a feature of New Zealand quakes in the past. Since 1814, four great shocks have been felt in New Zealand, viz., in 1826, 1848, 1855, and 1929, but none compares, especially in destruction of life, with that of 1931.

On March 7, and again more strongly during the early morning of March 8, destructive quakes were felt over a large part of the Balkan Peninsula; destruction and loss of life occurred over an area 100 miles in diameter, while the total disturbed area was at least 350 by 200 miles. The epicentre was probably about 100 miles north of Salonika, close to one of the most seismically active zones in the central peninsula.

On March 31, Managua, capital of Nicaragua (q.v.), was almost completely destroyed by a violent earthquake which was followed by strong aftershocks; out of a population of 50,000, several hundred were killed. This quake took place in an almost dormant seismic zone; the principal shock was of exceptionally brief duration—it lasted only a few seconds—and the area of damage was comparatively small.

Several towns were ruined in northwestern Argentina on January 14. Central Java was shaken on January 21, and considerable damage caused. Great damage and loss of life occurred at Koritza in Albania on January 28. Some damage was caused along the coast of Chile on March 5. Destructive quakes in the

Caucasus region on the Armenian-Persian frontier on April 27, killed about 400 people, and injured 2000. On August 10, one of the greatest quakes of the year took place in Sinkiang province, China, on the western edge of the Gobi desert; and another one 400 miles to the north occurred on August 18.

A mild shock was widely felt in Texas and New Mexico on August 16; and another occurred in the Mississippi Valley on July 18, with an epicentre close to New Madrid. See **SEISMOLOGY**; **ARMENIA** and **NICARAGUA** under *History*; **GEOLOGY**.

**EAST AFRICA PROTECTORATE.** See **KENYA COLONY**.

**EAST PRUSSIA.** A Province of the State of Prussia separated from Prussia and from the German Reich by the Polish Corridor (q.v.). Its area on Apr. 1, 1929, was 14,401 square miles and its population June 16, 1925, was 2,256,349. See **GERMANY** and **POLAND** under *History*.

**ECLIPSES.** See **ASTRONOMY**.

**ECOLOGY.** See **BOTANY**; **ZOOLOGY**.

**ECONOMIC ASSOCIATION, AMERICAN.** An organization founded in Saratoga, N. Y., in 1885 to encourage economic research, especially the historical and statistical study of the actual conditions of industrial life; to issue publications on economic subjects; and to encourage perfect freedom of thought and discussion upon current problems from an economic point of view. The membership, which in 1931 totaled approximately 3800, comprises persons interested in the study of political economy or the economic phases of political and social questions.

The association held its annual meeting in Washington, D. C., Dec. 28-30, 1931. Among the topics discussed were: "Technological Change as a Factor in Unemployment"; "Economic Organization and the Control of Industry"; "The Changing Character of the Transportation System"; and "Recent Bank Changes." Papers read at the meetings are published in the *Proceedings* of the association. The official periodical is the *American Economic Review*, a quarterly. The officers in 1931 were: President, Ernest L. Bogart, University of Illinois; vice presidents, Edmund E. Day, New York City, and Eliot Jones, Stanford University; counsel, John E. Walker, Washington, D. D.; and secretary and treasurer, Frederick S. Deibler, Northwestern University.

**ECUADOR**, ek'wá-dór. A South American republic situated on the northwest coast of the continent between Colombia on the north and Peru on the south. The capital of the republic is the city of Quito.

**AREA AND POPULATION.** The area in 1931, still undetermined because of the boundary dispute with Peru, was variously estimated at from 110,000 to 284,000 square miles, including the Galapagos or Colon Islands (2868 square miles), situated 600 miles West of Ecuador in the Pacific. The population in 1929 was estimated at 2,533,000 (2,000,000 in 1926), including 10,000 foreigners. One estimate placed the white population at 10 per cent of the total; Indians, 38 per cent; mixed, 41 per cent; Negroes, 5 per cent; others, 6 per cent. The chief cities, with their approxi-

mate populations in 1929, are: Guayaquil, 100,000; Quito, 91,600 in 1930; Cuenca, 50,000; and Riobamba, 27,000. Births in 1930 numbered 97,824; deaths, 44,673.

**EDUCATION.** Primary education is free and nominally compulsory but there is a large percentage of illiteracy. According to the President's message of Aug. 10, 1931, there were during the 1930-31 school year 2081 elementary schools, with 3618 teachers and 149,065 enrolled pupils. Seventeen secondary schools enrolled 2992 pupils and other vocational institutions and special classes, 5234. The four universities at Quito, Guayaquil, Cuenca, and Loja reported a total of 920 students in 1930.

**PRODUCTION.** Ecuador is primarily an agricultural country, whose prosperity has been undermined by an alarming shrinkage in the production and exportation of cacao, caused by plant diseases. Exports of cacao in 1930 represented only 29 per cent of the total value of exports, compared with 63.2 per cent in 1913 and 62.2 per cent in 1918. In 1930, cacao exports totaled 44,273,000 pounds, valued at \$4,681,000 (40,142,000 pounds, valued at \$4,251,000, in 1929). Production of the other chief crops in 1930 was: Coffee, about 21,600,000 pounds (18,800,000 in 1929); rice, about 82,000,000 pounds; cotton, about 5,760,000 pounds in 1930-31 (3,245,000 in 1929-30); sugar, about 20,000 long tons for 1929-30. Cereals, potatoes, and fruit are other important crops. Livestock in 1930 was estimated at 1,280,000 cattle, 700,000 sheep and goats, 150,000 swine, and 85,000 horses. Tagua nuts (vegetable ivory), kapok, and rubber are the chief forest products. The output of the principal minerals in 1930 was: Petroleum, 1,559,000 barrels (1,351,000 in 1929); gold, 69,482 troy ounces; silver, 100,128 troy ounces. The leading industries are the making of straw hats, textiles, and shoes, the grinding of sugar cane, and rice hulling.

**COMMERCE.** Preliminary figures showed general imports in 1930 of \$12,796,000 (16,967,000 in 1929) and general exports of \$16,129,000 (\$17,207,000 in 1929). As compared with 1929, imports declined 24.6 per cent and exports 6.3 per cent. The leading exports, in order of value, were: Cacao, petroleum, coffee, straw hats, gold and silver, tagua nuts, and rice. The United States is the principal export market and source of imports, taking 47.2 per cent of all exports in 1930 (45.2 per cent in 1929) and supplying 40.1 per cent of all imports (40.8). The United Kingdom in 1930 furnished 18.2 per cent of the imports and Germany 13 per cent. For the 12 months ended June 30, 1931, exports to the United States were valued at \$4,719,000 (\$5,523,000 in 1929-30) and imports from the United States were \$3,975,000 (\$5,302,000).

**FINANCE.** According to a preliminary statement covering the supplementary period only up to the end of January, 1931, national revenues and expenditures in 1930 were below budget estimates and amounted to 60,112,141 sucres and 60,704,060 sucres, respectively. Expenditures included funds set aside for service of the national debt and for the treasury reserve. Customs receipts during 1930 totaled 22,287,337 sucres, as compared with 26,249,203 sucres in 1929. The national budget for 1931, enacted in the latter part of the year, calculated both revenues and expenditures at 61,476,600 sucres. During 1930 the Government deposited the amounts due as

service on the external debt, exclusive of the Swedish match loan, in the Central Bank rather than remitting payments to the bondholders. On Dec. 31, 1930, the public external debt totaled \$22,701,000, as against \$22,165,000 on Jan. 2, 1930, while the internal debt was 10,837,000 sucres (\$2,167,400), compared with 11,950,000 sucres (\$2,390,000) on Jan. 2, 1930. The sucre was stabilized at about \$0.20 U. S. currency in 1927.

**COMMUNICATIONS.** In 1929, there were 652 miles of railway line in operation, divided into nine systems. Main highways in 1930 extended about 1388 miles; new motor roads were under construction in 1930 and 1931. Of the two airlines in operation, one, the Scadta line, suspended service during 1931. Guayaquil is an important port of call for European and American lines.

**GOVERNMENT.** The Constitution promulgated Mar. 26, 1929, vested executive power in a president elected for four years by direct suffrage, and legislative power in a congress of two houses. The Senate has 32 members elected for four years by the Provinces and occupational groups; the Chamber of Deputies, 56 members elected for two years by direct vote of literate male and female citizens. A drastic reorganization of the central administrative system became effective Jan. 1, 1931, under a law promulgated Dec. 9, 1930. The law established the following ministries: Government and Social Welfare; Foreign Affairs; Public Education; Public Works, Agriculture, and Promotion; Finance and Public Credit; War, Navy, and Aviation. President at the beginning of 1931, Dr. Isidro Ayora, reelected Mar. 27, 1929, for the term ending Aug. 31, 1932.

#### HISTORY

**THE GOVERNMENT OVERTURN.** On Aug. 24, 1931, Dr. Isidro Ayora resigned as President of Ecuador, a post he had filled with ability and patriotism since assuming power in April, 1926, through a military *coup d'état*. Under his leadership the Constitution was amended and restored to operation and he was reelected as Constitutional President on Mar. 27, 1929, by a Constituent Assembly. Dr. Ayora succeeded in reorganizing the fiscal and banking systems and inaugurating much-needed public works, despite the continued economic depression, which commenced in 1927. The collapse of agricultural prices forced his Government repeatedly to reduce expenditures in order to balance the budget. The civil servants affected protested and unrest was reported in the army. In the spring of 1931 all expenditures on public works were stopped, arousing the hostility of leading cities, particularly Guayaquil, where sanitation and dock works were in progress. The failure in May of the Banco del Ecuador, one of the principal private credit institutions of the country, and of other banks, aggravated the financial distress. Communist propaganda was reported to be making rapid headway among the laboring classes, and there were several attempts at Indian risings, especially at Cayambe, near Otavalo, to secure distribution of the large landed estates.

There was also friction between the President and Congress, and much public dissatisfaction at the awarding of a match monopoly to the Swedish Match Company in return for a \$2,000,000 loan. Discouraged by his numerous problems

and the loss of congressional support, President Ayora resigned following a mutiny of the Chimborazo Regiment and took refuge in the American Legation. Col. Luis Larrea Alba, whom Dr. Ayora appointed Minister of Government, became Acting President. In accordance with the Constitution, Colonel Larrea Alba immediately fixed October 20 as the date for a presidential election. On October 15, however, he proclaimed a dictatorship with the support of two regiments, but the opposition of the other regiments of the Quito garrison and of the populace frustrated his plans and he was forced to resign, with his entire Cabinet. Stoned by indignant citizens, one of the regiments supporting Colonel Larrea Alba fired into a crowd, killing seven.

Larrea Alba, on resigning, appointed as his successor Former President Alfredo Baquerizo Moreno, then serving as President of the Senate. Under the latter's direction, elections were held October 20, in which Señor Neptali Bonifaz, an independent in politics and one of the country's wealthiest landowners, was victorious over Señor Modesto Larrea Jijon, a cousin of Larrea Alba and presumed to have official support. While the election was reported to be free and orderly, only 26,000 votes were cast out of a population of more than 2,000,000. President-elect Bonifaz, however, was closely affiliated with the landowning and conservative classes and his election widened the breach with the liberal and radical elements. Predictions that a violent effort would be made to prevent his taking office were borne out when an insurrection broke out in the Province of El Oro early in November. The revolt was crushed and the leaders arrested without serious fighting. At the same time Alfonso Larrea Alba, brother of the former Provisional President, and about 15 other army officers were arrested.

One result of the overthrow of the Ayora government was the cancellation by Congress on September 15 of the match monopoly granted the Swedish Match Company. This involved the repayment of the Kreuger-Toll loan of \$2,000,000, which was to be taken from deposits for the service of the foreign debt in the Bank of the Republic. Manuel Navarro, Speaker of the Chamber of Deputies, was mobbed by occupants of the gallery when he cast the sole dissenting vote against cancellation of the match monopoly. On Dec. 13, 1931, the Minister of Public Works announced that the contract of the J. G. White Engineering Company of New York for the installation of a sanitation system at Guayaquil would be cancelled. During 1931, Ecuador was in default on debt service payments due on seven railway and salt loans, the principal outstanding aggregating \$16,658,550.

Ex-President Ayora was cleared of charges of misuse of government funds by a congressional committee on November 26. A landslide on the Guayaquil and Quito Railway early in 1931 cost nearly 200 lives and extensive damage to the railway. For the resumption of diplomatic relations between Ecuador and Colombia, see COLOMBIA under *History*.

**EDDINGTON, A. S.,** THEORIES OF. See ASTRONOMY.

**EDESON, ROBERT.** An American actor, died in Hollywood, Calif., Mar. 24, 1931. He was born in New Orleans, La., June 3, 1868. He made his debut in Brooklyn, N. Y., in 1887 in *Fascination*, and after playing in stock and road com-

panies for about 10 years returned to New York to support Maude Adams as the Rev. Gavin Dishart in *The Little Minister*. In 1899 he appeared as David Brandon in *The Children of the Ghetto*, making his first appearance on the London stage in that year in the same part. He commenced his career as a star in *Soldiers of Fortune* in 1902 and appeared as Soangataka in *Strongheart* on both the New York and London stages in 1905-07. He next appeared in *Classmates* (1907); *The Sinner* (1908); *The Call of the North* (1908-09); *The Offenders* (1908); *The Noble Spaniard* (1909); *The Outpost* (1909); *A Man's a Man* (1910); and his own play, *Where the Trail Divides* (1910). Then followed *The Cave Man* (1911); *The Indiscretion of Truth* (1912); *Fine Feathers* (1912); *Husband and Wife* (1915); *His Brother's Keeper* (of which he was author, 1916); *The Knife* (1917); *The Riddle: Woman* (1918); *A Good Bad Woman* (1919); and *The World We Live In* (1922). After 1921 he devoted himself to motion pictures in connection with the Famous Players-Lasky Corporation, appearing as an actor in silent films and later as studio director and coach.

**EDISON, THOMAS A (LVA).** An American electrician and inventor, died in West Orange, N. J., Oct. 18, 1931. He was born in Milan, Ohio, Feb. 11, 1847, and when he was 7 years of age his family moved to Port Huron, Mich., where the remainder of his boyhood was passed. His schooling was limited, but he received some instruction from his mother, and at the age of 12 he became a newsboy on the Grand Trunk Western Railway. His spare hours were spent in reading and in boyish experiments, largely with electrical and mechanical apparatus, while in addition with a small printing press he published a weekly known as the *Grand Trunk Weekly Herald*, doing the printing in a baggage car where he installed his chemical apparatus. He was forced out by the conductor on account of a fire caused by some of his chemicals.

Due to his saving the child of a station master from the wheels of an approaching train, Edison became a pupil in the telegraph office at Stratford Junction, Ont., in 1863, and shortly made himself a brilliant and rapid operator. He was enabled to carry on studies in electricity and telegraphy, and his inventive genius manifested itself in an automatic reply signal indicating his presence in the station instead of the manual signal required every half hour when on duty. The automatic signaling device became the forerunner of the familiar messenger call box, but unfortunately, led to his discharge, and he sought and secured employment as an operator in several cities, arriving at the Western Union office at Boston in 1868.

During this time he made his first important invention, namely, a repeating telegraph instrument which enabled a message to be picked up and transmitted automatically on a second line without the presence of an operator. In New York, whither he went from Boston, he secured a mechanic's job in the office of the Law Gold Reporting Company, which maintained a ticker service, and not only repaired instruments but developed an improved stock ticker and other telegraphic appliances. His two-wire Universal stock ticker invented in 1870 remained standard and unchanged for over 50 years. With money received from his invention he established a shop in Newark, N. J., where he was enabled to develop his

duplex and multiplex telegraphs. From 1872 to 1876 his inventions included the motograph, the automatic telegraphic system, the duplex, quadruplex, and multiplex telegraphic systems, the carbon rheostat, the microtassimeter, and other devices. In the years between 1860 and 1910 in the telegraph field alone Edison applied for 1328 patents. Between 1876 and 1877 he devised the carbon telephone transmitter which made telephony a commercial art and fitted in with the telephone as invented by Bell. The carbon transmitter also involved the microphone, which had constantly increasing application and was finally utilized in radio transmission. In 1877 he invented the phonograph which eventually he improved with various subsequent inventions so that by 1890 it could be put on a commercial basis as a widely used industrial instrument.

Edison removed his workshop from Newark to Menlo Park, N. J., in 1876, where he invented the incandescent lamp on Oct. 21, 1879; the first modern incandescent lamp was placed in a circuit and maintained its incandescence for more than 40 hours, demonstrating the practical quality of this invention. The incandescent lamp was more than an isolated invention, for with it came improved dynamos, a system of distribution for current and its regulation and measurement, including such devices as the sockets and switches ordinarily used together with the meters. In fact, Edison invented not merely a lamp but a complete system, or more properly the art, of incandescent electric lighting which was first exemplified in the Pearl Street Station, New York City (1881-82). In 1881 the first commercial incandescent lamp factory was established in Harrison, N. J., and the various devices invented and devised for incandescent lighting were placed in production on a commercial basis. At this time he had invented and developed a full-sized electric railway for freight and passengers at Menlo Park. In 1883 he discovered the "Edison Effect" which became so important a consideration later in radio tubes.

In 1887 Edison removed to West Orange, N. J., where he established the laboratory in which his subsequent scientific and inventive work was carried on. About this time he had invented an induction system of wireless telegraphy to and from trains in motion or between moving trains and railroad stations, and worked on an improved cylinder phonograph which was available for commercial dictation and carried with it various adjunct and auxiliary devices. This work alone involved more than 80 patents. About 1891 he made a number of inventions relating to electric railroads and was the first to perfect the motion-picture camera where a rapid succession of pictures were made on a traveling film and then reproduced in his so-called kinetoscope. Between 1900 and 1910 he invented and developed the Edison alkaline storage battery and in addition to his electrical work became interested in the production of Portland cement. Between 1910 and 1914 he was engaged on an improved disk phonograph with a diamond-point reproducer and an indestructible record. In 1912 came the kinetophonograph, or talking motion-picture system, where the phonograph was combined with the kinetoscope. About 1913, desiring to become independent of ordinary sources of carboic acid, he devised a plan of making this material synthetically, and in 1915 developed extensive chemical processes so as to secure chemical materials which

previously had been imported from Germany. In 1914 he developed the telescribe, which combined the telephone and dictating phonograph for the recording of telephone messages. In July, 1915, Edison was made president of the Naval Consulting Board, and when the United States entered the World War he made many war inventions for the U. S. Government.

Edison's honors included appointment as chevalier, officer, and commander of the Legion of Honor by the French Government. In 1903 he was made honorary chief consulting engineer of the St. Louis Exposition held in 1904. He received the award of the John Fritz Medal in 1908, of the Rathenau Medal (a German honor), and a medal of the American Museum of Safety in 1914. A most unusual number of his many inventions were of extraordinary value from the practical standpoint and in their effect upon human life. Edison was the first to apply electrical energy on a large and practical scale and it is doubtful if any single invention has had more effect on civilization than the incandescent lamp, and few devices have found wider application than the phonograph in its various forms. Edison was distinctly a true and real inventor and often was able to utilize in a practical way the scientific thoughts or discoveries which had been the works of others. No one ever had a saner and surer instinct in combining in correct and useful form mechanical or electrical elements to secure a useful purpose. He was able to apply a scientific truth to a practical end to an extraordinary degree, and so rapid were the developments secured by his efforts that he was popularly known as a wizard. He received a congressional gold medal in 1928 on the occasion of the fiftieth anniversary of his invention of the electric light, a medal from Pope Pius XI in 1930, and numerous honors from governments, universities, and leading societies. His death occasioned world-wide expressions of grief and appreciation. Among the biographies are: Dyer and Martin, *Edison: His Life and Inventions* (2 vols., 1910); George Sands Bryan, *Edison: The Man and His Work* (1926).

**EDUCATIONAL PSYCHOLOGY.** See **PSYCHOLOGY**.

**EDUCATION ASSOCIATION, NATIONAL.** See **NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES**.

**EDUCATION IN THE UNITED STATES. STATISTICS.** *Attendance.* Attendance statistics for 1930 were issued by the U. S. Census Bureau and the following summary was in the *United States Daily*:

There were 38,387,032 persons from five to twenty years of age in the population of the United States on April 1, 1930, of which number 26,849,639, or 69.9 per cent, were returned as having attended school at some time since September 1, 1929. For males from 5 to twenty years of age, the percentage attending school was 70.2, and for females 69.7.

The number of persons from 5 to 20 years of age returned in 1930 as attending school, 26,849,639, represents a gain of 5,475,663 since 1920, when the number so returned was 21,373,976. The percentage attending school increased from 64.3 to 69.9 in the 10-year period.

Of the whole number of children 7 to 13 years of age, 95.3 per cent were attending school; of those 14 and 15 years, 88.8 per cent., of those 16 and 17 years, 67.3 per cent, and of those 18 to 20 years, 21.4 per cent. The number of persons 21 years of age and over reported in 1930 as attending school was 1,034,782, as compared with 844,789 in 1920.

Of the native whites of native parentage, 96.1 per cent of those from 7 to 13 years old were attending school; 90 per cent of those 14 and 15 years; 61 per cent of those

16 and 17 years, and 24.4 per cent of those from 18 to 20 years. For native whites of foreign or mixed parentage in these age groups, the percentages were, respectively, 98, 91.3, 54.4, and 19.8.

In the foreign-born white population, 97.5 per cent of those from 7 to 13 years old were attending school; 92.6 per cent of those 14 and 15; 52.3 per cent of those 16 and 17, and 15.6 per cent of those from 18 to 20 years.

**Costs.** The U. S. Office of Education reported that more than 23 per cent of all public revenue from tax collections was being expended for elementary and secondary school instruction. The cost of such schools amounts to more than \$2,180,000,000. More than \$5,486,000,000 are invested in buildings, grounds, and equipment. The cost of public instruction has risen from \$1,580,671,296 in 1922 to the figure given. It is shown that the income of the nation and the cost of maintaining the schools have increased at approximately the same rate. The Office of Education reported that salary increases among teachers appeared in practically every class of school during the school year ending in June, 1931. In individual instances, however, there was a drop. The median salary for rural school teachers in 1930 was \$926. This compared with \$1771 for city teachers. The median salary for the rural white teachers in the 17 States that segregate the negro children was \$945, while that of the negro teachers in these States was \$388.

The problem of financing the educational system received much attention during the year. Various forms of taxation to meet the needs of the schools were considered by the legislatures that met in 1931. In many places the problem of support had not been solved. Nearly all of the school systems had found it necessary greatly to curtail expenditures. This was done in a variety of ways. Among these may be mentioned the following: increasing the size of classes in order to reduce the number of teachers that are needed; shortening the school period in order to reduce the salaries of teachers and the cost of maintenance; reducing the salaries of the school staff (in some places this took the form of a 10 per cent reduction; in a few, the reduction was even larger); and reducing the school offerings and equipment.

During recent years there has been considerable extension in the offerings provided by school systems. Kindergartens have become common, and nursery schools have been maintained by some cities. There has been a great improvement in school buildings with a resulting increase in bonded indebtedness. In rural sections, provisions have been made for the transportation of school children. The National Association of Motor Bus Operators reported that more than 1,500,000 children were transported each day, and that the annual cost was approximately \$35,000,000. All of these improvements were justified by those who control the school, and they were approved by those who support the school. In 1931, however, the problem of supplying the funds had become critical in many sections.

**Illiteracy.** The 1930 census reports show that on Apr. 1, 1930, there were in the United States 4,283,753 illiterate persons. For the purpose of the census, any person ten years or older who was unable to read and write was considered illiterate. It was not required that he read and write the English language. Of the illiterates in the United States in 1930, 407,218 were white, 1,513,892 were negroes, and 362,643 were of other

racers. For native whites the percentage of illiteracy was 1.5, for foreign-born whites 9.9, for negroes 16, and for the other races 25.

Iowa ranked first in literacy. In that State only 0.8 per cent of the persons ten years of age or over were not able to read or write. There has been a reduction of illiteracy from 6 per cent in 1920 to 4.3 per cent in 1930. Dr. Louis I. Dublin, vice president and statistician of the Metropolitan Life Insurance Company, stated that on the bases of census figures, there were more than 3,000,000 children between the ages of seven and seventeen who were not in school. He estimated that about 2,000,000 of these were gainfully employed; the others were not. He called attention to the fact that this group of children out of school represented approximately 10 per cent of that age group in our total population.

*Public, Society, and School Libraries.* During the year, the Federal Office of Education issued a report on the statistics for American libraries, collected for 1929. It shows that there are 33 books for every 25 persons. There is one library for every 11,226 American citizens. In the 6429 libraries and 4387 branch libraries that reported, there was a total of 154,316,858 bound volumes. In 6057 libraries that reported, 10,453,672 volumes and pamphlets had been added during 1929. In 4134 libraries that reported, there were in force 19,635,906 borrowers' cards. The books issued for use outside of the library in 4380 that reported this item numbered 336,758,203. The report shows that there are 1982 school libraries having more than 3000 volumes each. In 1923, there were only 947 such libraries. The annual cost of the libraries is \$69,294,121, of which \$52,620,396 is supplied by taxes. Of the total library expenditures, \$16,590,538 was used to buy books. Sixteen of the forty-eight States had one or more libraries containing more than 500,000 volumes. New York State had seven such libraries. Illinois and California each have four. See LIBRARY PROGRESS.

**EDUCATIONAL CONDITIONS.** For a decade or more the improvement of public education had received marked consideration. The attempts at improvement have taken one or more of three forms. These may be described as curriculum changes, improvement of teachers, and improvement of buildings and equipment.

The changes in curriculum, particularly of the elementary school, have been very marked. Many cities have expended large sums in the employment of those who devoted their time and attention to work on the curriculum. There have been some outstanding results.

The improvement of teaching has in general taken the form of increased training for the teaching profession. Until 1920 the normal school was considered adequate for the purpose of training the elementary teachers. As a matter of fact, many who entered the schools as teachers had received their training in one year in classes conducted in connection with high schools. The emphasis that has been placed upon better preparation of teachers has led to the changing of normal schools into teachers' colleges and the requirement that the prospective teacher receive three or even four years of training instead of two.

The improvement of buildings and equipment has been remarkable. Better lighting, better ventilation, and more desirable surroundings have resulted.

It was surprising that after this period of intensive effort to improve the schools, there should come into existence the most pronounced criticisms of elementary and secondary education that have appeared in years. All features of the educational system were under severe condemnation in many quarters. Laymen looked upon the changes in curricula as serious defects. Parents whose children sought admission to college were often very greatly distressed with the difficulties that their children experienced in entering the institutions of their choice. The parents believed that this difficulty was due in large measure to the newer notions that were operating in the public schools. Even within the profession itself there was no definite agreement in regard to the value of some of the changes that were proposed. In some cities where new courses had been formed the old ones continued in use because the teachers and school officials did not have confidence in the new provisions.

Many of those who criticized the modern school were equally critical of the educational system which it was supposed to replace. Such critics did not desire to return to the old form, but they believed that school people had not worked out a thoroughly reliable and effective scheme for education that was in keeping with modern demands.

The problem of improving teaching through increasing the amount of training that teachers receive was also clouded with uncertainty. Within the profession there was a conception that length of training and efficiency in teaching were closely correlated. This would seem to be a reasonable assumption, yet no one presented evidence that is conclusive. In the meantime there was a larger number of trained teachers entering the schools each year. It was startling that there should be a growing conception that teaching was not being as well done now as it was earlier. Unquestionably there was an oversupply of teachers. There was, however, not a sufficient number of those who had two years or more of training to fill the positions.

It was true that the aims and purposes of public education were less well defined than at any previous time in the history of the United States. Even those who are regarded as leaders in the educational field do not agree among themselves as to what the school should accomplish and there is even less agreement as to how the purposes of the school may be accomplished. This leads to a distressing amount of uncertainty on the part of teachers. They assert that their efforts are judged in respect to the opinions of those who observe, yet the results of their work are determined by testing the achievement of their pupils in the identical subjects that were required before the newer conceptions came into existence. It was certain that increased training of teachers cannot bring the desired improvement in instruction until the aims and purposes of education are more clearly defined. It was true that such teachers as were found in the schools could render far better service if they knew more definitely what was expected of them.

Every one connected with the schools believes that proper buildings and surroundings are a very decided factor in the educative process. Now, however, the time has come when those in control of the financial aspects of education find it very difficult to persuade tax-payers that money spent for such improvements is essential. As a

consequence, in nearly every city in the United States there was an attempt to economize on the equipment that was supplied. Textbook publishers reported a startling decrease in the number of books ordered by the schools. One system even considered the possibility of defraying part of the expense of books by the sale of advertising in such books.

The U. S. Office of Education, acting under the authority of Congress, undertook extensive investigations in three fields that relate to the welfare of the schools.

The first of these investigations had to do with secondary education in the United States. The report of the commission working on this topic was awaited with great interest. It seemed certain that the report would serve to clarify many ideas in respect to the field of secondary education. Some of the best persons in the profession were associated with this commission and there had been funds sufficient to employ a number of thoroughly competent helpers.

The second investigation to be started dealt with teacher training in the United States. The commission was considering every aspect of the teacher training problem. Its report was not to be forthcoming for another year.

The third investigation to be undertaken related to the financing of public education. The Office of Education brought together in this commission a group of prominent persons representing various fields of interests. The attempt was to be made to have the investigation thorough and comprehensive. The report was not due for two years.

**MOTION PICTURES AND RADIO.** Plans for the use of motion pictures, talking pictures, and radio progressed during the year. Not as much was written in regard to motion pictures as appeared earlier. Probably this was due to the fact that motion pictures were established in most prominent school systems in the United States. The problem that confronted the producers was connected with the development of more suitable pictures and more effective ways of employing them for instructional purposes. The Department of Visual Instruction of the National Education Association urged that a course in visual and other sensory aids in teaching be required of all persons preparing for the profession of teaching, and that teacher training institutions in every State be requested to organize and offer such courses, beginning with the scholastic year of 1931-32.

The use of radio as an educational means received a large amount of attention during the year. There were two national organizations for the furtherance of radio in education. One was the National Advisory Council on Radio Education organized in 1930 and supported for a period of three years by John D. Rockefeller and by the Carnegie Corporation. Dr. R. A. Millikan, California Institute of Technology, was the president of the Council. Both the National Broadcasting Company and the Columbia Broadcasting System were in sympathy with the purposes of the Council and had representatives in its active membership. Committees of the Council were undertaking the preparation of programmes of high quality in such subjects as agriculture, art, history, foreign languages, mathematics, philosophy, political science, and science.

The second organization concerned with radio was the National Committee on Education by

Radio. The purposes of the committee as stated in the by-laws are:

To secure to the people of the United States the use of radio for educational purposes by protecting the rights of educational broadcasting, by promoting and coordinating experiments in the use of radio in school and adult education, by maintaining a service bureau to assist educational stations in securing licences and in other technical procedures, by exchange of information through a weekly bulletin, and by serving as a clearinghouse for the encouragement of research in education by radio.

This committee published a weekly bulletin of information. It was urging Congress to set aside 15 per cent of all available radio channels for education. It was also developing a programme of research in education by radio. The work of this committee was financed for a period of five years by the Payne Fund.

**NATIONAL ADVISORY COMMITTEE ON EDUCATION.** In his annual message to Congress on Dec. 3, 1929, the President said:

In view of the considerable difference of opinion as to policies which should be pursued by the Federal Government with respect to education, I have appointed a committee representative of the important educational associations and others to investigate and present recommendations.

The report of the National Advisory Committee on Education entitled, *Federal Relations to Education*, was presented to the President and printed late in 1931. The report occasioned much discussion in educational circles. In some quarters it was opposed; in others it was vigorously praised. In effect, it again raised the issue of forming a Department of Education having a Secretary in the President's Cabinet.

The committee found that Federal appropriations authorized for the aid of general and special education amounted to \$23,778,680 in 1930. Of this amount, the Office of Education in the Department of the Interior received \$351,624, agricultural and mechanical colleges \$2,550,000, agricultural experimental stations \$4,335,000, agricultural extension work \$7,662,936, vocational education \$7,800,000, and vocational rehabilitation \$1,079,120. It appeared, therefore, that the Federal government was participating in education with the States, yet the report asserted that there was "no inclusive and consistent public policy as to what it should or should not do in the field of education. Whatever particular policies it seems to be pursuing are often inconsistent with each other, sometimes in conflict. They suggest a haphazard development wherein policies of far-reaching effect have been set up as mere incidents of some special attempt to induce an immediate and particular efficiency."

The committee found that there were seven distinguishable fields, in each of which the Federal government has either at the origin or at subsequent periods in its development definitely assumed responsibility for education. There are various overlappings, but these fields may be broadly classified as:

1. The education of the people in the several States. In this the function of the Federal Government has largely been one of cooperation in fostering the education of the people under State jurisdiction.
2. The education of persons resident on special Federal areas, such as Government reservations and Federal districts, lying outside the legal jurisdiction of State and other regional governments.
3. The education of the American Indians and other indigenous peoples within the national jurisdiction.
4. The education of the peoples of the Territories and outlying possessions.

5. The training of persons in the service of the National Government.
6. Scientific research and the collection and diffusion of information regarding education.
7. The intellectual and educational coöperation of the United States with other nations.

The report considers each of these fields and offers specific recommendations. In respect to Federal relations to education in the States the following recommendations are offered.

- a. That the special aid now in force be continued for at least five years and until a comprehensive financial survey of tax systems, distribution of national incomes, living costs, etc., can be completed.
- b. Amend existing laws so as to prevent the Federal Government and its agencies from interfering with the autonomy of the States in matters of education. This would mean the repeal of all provisions that require the States and the local community to match Federal funds or that grant power to the Federal agencies to approve or reject State educational plans.
- c. Make all future grants to States as grants in aid of education in general, expendible by each State for any or all educational purposes as the States themselves may direct. The only restriction to be placed on such grants should be the provision that every State, when it accepts the grant, agrees to make each year to the Federal headquarters for education a full report on all questions on which the Federal headquarters for education may require information concerning the manner in which the State has used the grant.
- d. Provide adequate Federal headquarters for educational research and information.
- e. Increase the Federal appropriations for educational research and information service.

Concerning education in special Federal areas, it is recommended:

- a. That the Federal Government assume direct responsibility for the education of the residents of Federal reserve areas, districts, reserves or reservations.
- b. Formulate a general programme and set up an efficient organization by which the Federal Government shall provide or contract for educational facilities.
- c. Leave the central administration of school facilities for Federal area school children under the control of that particular Federal department responsible for the special governmental function for which the area is reserved.
- d. Establish expert local supervision.
- e. Cooperate with the State systems.

As applied to the education of the Indians and other indigenous peoples, the recommendations made are:

- a. That there be established in the Bureau of Indian Affairs a planning and development division which shall be concerned only with basic investigations, this division to be responsible for developing a new type school suitable for the education of peoples with different cultural backgrounds.
- b. Provide for a permanent conference to consider all problems arising in connection with the development of primitive and native peoples under the jurisdiction of the Federal Government.
- c. Gradually delegate the management of Indian affairs to local officials.
- d. Provide a trained personnel.

Among the recommendations made for education in the Territories and outlying possessions are the following:

- a. Continue to emphasize educational means as an instrument in the life of our politically dependent peoples.
- b. Formulate a more comprehensive and unified Federal policy of education in regard to these peoples.
- c. Employ educational advisors.
- d. Provide conferences such as that recommended for the Indians and other indigenous peoples.

The committee has considered the training of government personnel. It recommends:

- a. The encouragement of the widespread use of school and course training in improving the administrative and other services of the Government.
- b. The maintenance of a training professional educational advisory service in every department or independent establishment that conducts any considerable number of classes or schools.

- c. The organization of representatives of these advisory educational services as a subcommittee on the Interdepartmental Council for Education.
- d. The authorization of an inclusive survey of all the policies and practices followed throughout the different divisions of the Government, with the idea of recommending a more consistent, effective, and economical programme for the training of government personnel.

In the field of research and information service, the committee recommends:

- a. The development of the Federal Government's research and information services with increasing emphasis on comprehensive research and on the diffusion of information that is pertinent to the decision of critical national issues.
- b. The expansion of the Federal research and information service in the field of education.
- c. The coordination of activities through the Interdepartmental Council for Education.
- d. The granting of a proper status in the general headquarters for education, such that it may present forcibly both to Congress and to the President the scientific and other professional facts which are pertinent and crucial in determining the policies of the Federal Government with regard to education.

One section of the report is devoted to international intellectual relations. The recommendations include:

- a. The encouragement of international coöperation.
- b. The selection of appropriate commissions to represent the United States in international educational matters.
- c. The study of foreign education.
- d. The coordination of the visa machinery.

Each of the recommendations grows out of the facts that are presented by the committee. Of the 51 members of the committee who voted on the recommendations that have here been presented, 45 were in favor, and 6 opposed.

In the part of the report that deals with policies and procedures, the committee employed the name "Federal headquarters for research and information." The second section of the report deals with the governmental organization necessary to establish such a central agency. The report urges that—

The lack of such an official spokesman for education, competent and influentially situated in the Government, has been one of the conditions, and a major condition, which has permitted us to drift into our present dilemma where a nation, by tradition and experience opposed to the federalized administration of education, has in fact developed a pluralized Federal control of education in the States through various Federal agencies, which are not even coordinated in their efforts.

The committee therefore recommended "that a Department of Education with a Secretary of Education at its head be established in the Federal government." It recommended that there be transferred to this Department the present Office of Education and the duties of the Federal Board of Vocational Education. It stated:

The Department of Education, when properly established, will have sufficient financial support to enable it to collect and publish critical data and pertinent information on all significant phases of education. Some of the more important phases now needing this service are education in the outlying possessions and in foreign countries, education of the physically, mentally, and socially handicapped; education of government personnel under the various Departments; education on governmental areas; and the educational aspects of clinics, playgrounds, parks, libraries, museums, motion pictures, radio and other similar environmental activities that are such powerful influences in molding the spirit and character of American youth.

The committee safeguards the power of the Department of Education by stating that "it will have no legal or financial power and no regula-

tory or executive authority, direct or indirect, explicit or implied, by which it may control the social purposes and specific processes of education." The proposals that have been made by this committee in regard to the Department of Education in the Federal government differ from those previously made in that the "Secretary is without administrative portfolio. He is merely advisory and is left deprived of coercive authority. His influence is that of intellectual assistance based on fact-finding and experience reporting."

The committee was not as thoroughly agreed on this proposal as on the first part of the report. Thirty-eight were in favor, eleven were opposed, and two did not vote. The report includes a minority report which gives the views of those who voted against the proposal.

Another part of the report which was not accepted by some members of the committee is that which deals with Negro education. This group believes that the government will be compelled to give special grants for negro schools for at least a limited number of years. To assist in solving the problems raised by this group, Secretary Wilbur authorized the establishment of a National Advisory Committee on the Education of the Negro. The general purpose of this committee, he stated, will be to give advice and counsel in respect to the national problems and questions which are likely to arise in meeting the educational needs of the colored race. See *UNIVERSITIES AND COLLEGES*; also see under *PHILOLOGY, MODERN* for *Bibliography*.

**EDWARDS, MAJ. GEN. CLARENCE RANSON**, U. S. A., RET. An American soldier, died in Boston, Mass., Feb. 14, 1931. He was born in Cleveland, O., Jan. 1, 1860, and was graduated from the U. S. Military Academy in 1883. By successive promotions he attained the rank of major general and was retired in that grade in December, 1922, after 40 years of service. He participated in the campaigns in the Philippines, serving as adjutant general on Gen. Henry W. Lawton's staff in 1899. In 1902 he was made chief of the Bureau of Insular Affairs. In 1912 he returned to line service, and during 1915-17 was in command of the United States troops in the Panama Canal Zone. Later, he had charge of the Department of the Northeast, comprising the New England States, where he organized in 1917 the 26th or "Yankee" Division, going to France in command of that body. He participated in such important offensives as the Aisne-Marne, St. Mihiel, and Meuse-Argonne during the latter part of the World War. On his return to the United States he resumed command of the Northeastern Department, and in 1921 was assigned to the command of the 1st Corps Area, with headquarters in Boston. He received the Croix de Guerre with palm and was made an officer of the French Legion of Honor.

**EDWARDS, EDWARD IRVING**. A former United States Senator and Governor of New Jersey, died by suicide Jan. 20, 1931, in Jersey City where he was born Dec. 1, 1863. He attended New York University, and after 1882 had been connected with the First National Bank of Jersey City, becoming president in 1916 and chairman of the board in 1925. He was State Comptroller of New Jersey during 1911-17 and member of the State Senate in 1919, resigning the following year to become Governor. He was elected to the United States Senate for the term 1923-29, but was defeated for reelection.

**EGGS**. See *LIVESTOCK*.

**EGYPT**. A state in northeastern Africa, established as a nominally independent kingdom Mar. 15, 1922, following the termination on Feb. 28, 1922, of the British protectorate declared Dec. 18, 1914. It occupies the lower valley of the Nile and parts of the Libyan Desert, the region between the Nile and the Red Sea, and the Sinai Peninsula. Egypt's claim to jurisdiction over the Anglo-Egyptian Sudan is denied by the British. Capital, Cairo. Ruler in 1931, King Fuad I.

**AREA AND POPULATION**. While the total area of Egypt proper, excluding the Sudan, is about 386,000 square miles, the cultivated and settled area covers only about 13,600 square miles. The total population at the census of 1927 was 14,213,364, as compared with 12,750,918 at the census of 1917 and 9,734,405 in 1897. The estimated population in 1929 was 14,493,000. During the period 1925-29, births averaged 626,724 and deaths 378,027 annually, the excess of births being 248,698. The cultivated areas in 1929 were among the most densely populated in the world, with an average of three persons to an acre. Populations of the leading cities in 1927 were: Cairo, 1,064,467; Alexandria, 573,063; Port Said, 100,899; Tanta, 90,016; Mansura, 63,676; Asyut, 57,136; Faiyum, 52,863; Zagazig, 52,839; and Damanhur, 51,709. At the 1927 census, Moslems formed 91.19 per cent of the population; Christians, 8.34 per cent; Jews, 0.45 per cent.

**EDUCATION**. Primary instruction is supplied mainly by native schools called *maktabs*. In 1929-30, there were 2073 *maktabs*, with 188,789 pupils in attendance. The University of El-Azhar at Cairo and its six affiliated institutions had 2174 students enrolled in the same year. The total school population (5 to 19 years) in 1927 was 4,734,071, of whom 841,711 were attending school. About 88 per cent of the population 10 years of age or over were illiterate in 1927.

**PRODUCTION**. Agriculture is the main support of the population and cotton is the leading crop and chief export commodity, comprising 74 per cent of the total value of exports in 1930. In 1929, there were 8,504,000 acres of arable land, or 3.4 per cent of the total area; most of it was irrigated land in the Nile valley. Additional land was being brought under cultivation through the completion of the Nag Hamadi Barrage, a large irrigation project in Upper Egypt, in December, 1930, and a great drainage project for reclaiming more than 1500 square miles of saline land on the lower Nile delta. The cotton crop in 1930 totaled 811,166,000 pounds, compared with 825,028,000 pounds in 1929. Exports declined 22.3 per cent in quantity and 42.5 per cent in value, as against 1929 figures, causing acute depression among cotton growers and necessitating extensive Government aid. Other leading crops were: Wheat, 41,100,000 bushels in 1930 (45,228,000 in 1929); barley, 10,590,000 bushels in 1930 (12,669,000 in 1929); raw sugar, 108,000 metric tons in 1930-31 (107,000 in 1929-30); corn, beans, onions, millet, and rice. Livestock in 1929 included 801,000 cattle, 823,000 buffaloes, 1,003,000 sheep, 13,000 swine, 731,000 goats, 172,000 camels, and about 759,000 asses.

The chief manufactured products are sugar, cigarettes, petroleum products, boots and shoes, rugs, leather goods, furniture, and matting. The Government established a sugar monopoly in 1930. In the same year mineral production in-

cluded: phosphate rock, 313,478 metric tons; manganese ore, 121,211 metric tons; petroleum, 1,910,000 barrels. Gold, zinc, lead, silver, and salt are also produced.

**COMMERCE.** Imports during 1930 totaled £E47,488,000 (\$237,028,000) and exports £E31,942,000 (\$159,430,000), compared with imports and exports in 1929 of £E50,275,000 (\$280,885,000) and £E52,187,000 (\$260,479,000), respectively. The adverse trade balance in 1930 was £E15,546,000 (\$77,598,000), as against £E4,088,300 (\$20,408,000) in 1929; exports declined 38.8 per cent in value to the lowest dollar value since 1921, while imports decreased 15.6 per cent to the smallest since 1924. The principal exports in 1930 were: Cotton, \$118,735,000 (\$206,445,000 in 1929); cottonseed, \$9,306,000; cottonseed cake \$4,401,000; gold bullion, \$4,045,000; onions, \$2,697,000. Cotton piece goods, iron and steel, fertilizers, machinery, and wheat flour, in the order named, were the leading imports. The United Kingdom supplied 20.4 per cent of all imports (21.2 per cent in 1929) and took 34.5 per cent of the exports (34.9). France supplied 9.4 per cent and took 14.4 per cent; Germany, 7.9 per cent and 7.9 per cent; the United States, 4.7 per cent and 6.1 per cent, respectively. In 1931 imports declined roughly 36 per cent to £E31,528,790 and exports 13 per cent to £E27,937,110.

**FINANCE.** The budget estimates for the 1931-32 fiscal year (ending Apr. 30, 1932) placed receipts at £E39,316,000 and expenditures at £E38,884,000. This compared with estimated receipts and expenditures balancing at £E44,915,000 for 1930-31 and with actual receipts and expenditures of £E41,886,000 and £E41,128,000, respectively, for 1929-30. The 1931-32 budget estimates were the first since 1925 to balance without drawing upon the reserve fund, which amounted to £E40,509,190 on Jan. 1, 1931, and to £E39,852,370 on May 1, 1929. Part of the reserve fund, however, represented cotton purchased by the Government in an effort to stabilize prices. The public debt on Oct. 31, 1930, totaled £89,762,000 (\$436,827,000), including bonds held by the Government to the amount of £15,603,000 (\$75,932,000). The unit of currency is the Egyptian pound, with a par value of \$4.9431. The gold standard was abandoned on Sept. 27, 1931, when the pound fell to \$3.70.

**COMMUNICATIONS.** In 1929, there were 2874 miles of railway lines, of which 2008 miles were government owned. In the same year the government lines carried 27,225,000 passengers and 5,502,000 metric tons of freight, with gross receipts of £E7,163,000 (\$35,408,000). Highways in 1930 included 3760 miles of graded or drained dirt roads and 205 miles of macadam. In 1930 through air service to Persia and a weekly air postal service between Alexandria and Athens were established and the traveling time between Alexandria and London was cut to 60 hours. Ships arriving at Alexandria in 1929 numbered 2286, of 5,420,000 registered tons (2175 of 4,960,000 tons in 1928). See SUEZ CANAL.

**GOVERNMENT.** Under the Constitution promulgated Oct. 22, 1930, Egypt was declared an independent hereditary monarchy, in which the King exercises full executive powers as well as legislative powers concurrently with Parliament. His other extensive powers include the right to veto all laws passed by Parliament, the sole right to initiate financial laws, to dissolve the Chamber of Deputies to which the Ministers jointly and

separately are responsible, and the right to appoint and remove Ministers. He appoints 60 of the 100 members of the Senate, the other 40 being elected by universal suffrage, as are the 150 members of the House of Deputies. The King also nominates the President of the Senate. The term of Senators is ten and that of Deputies five years; one-half of the Senate is renewed every five years. Prime Minister in 1931, Ismail Pasha Sidky, who took office June 21, 1930. The Cabinet formed by Oct. 9, 1930, included: Prime Minister, Minister of Finance, and of Interior, Ismail Pasha Sidky; Foreign Affairs, Abdel Fattah Pasha Yehia; War and Marine, Mohamed Tewfik Pasha Rifaa; Justice, Aly Pasha Maher; Agriculture, Hafez Pasha Hassan; Public Works, Ibrahim Pasha Fahmy; Wakfs (religious foundations), Mohamed Halim Jassa Pasha; Education, Murad Sid Ahmed Pasha; Communications, Tewfik Pasha Doss.

### HISTORY

**THE MAY ELECTIONS.** During 1930, the Nationalist (Wafdist) movement for complete independence from British control was diverted by the outbreak of a violent internal struggle between King Fuad and the overwhelmingly Nationalist Parliament, headed by Premier Nahas Pasha. The struggle resulted in the dissolution of Parliament, the resignation of Nahas Pasha, the formation of a Conservative Ministry under Sidky Pasha, with very little popular support, and finally the promulgation of a new Constitution (see above under *Government*), which was repudiated by both the Wafd and the Liberal Constitutional party of former Premier Mohammed Mahmud Pasha.

Early in April, 1931, the Wafd and Liberal parties made public a pact pledging their mutual cooperation in opposing the Sidky Government. A boycott of all elections held under existing conditions and in accordance with the new Constitution was declared. The manifesto insisted that the 1923 Constitution was still valid, that the existing Cabinet was illegally appointed, and that only a constitutional government, supported by a lawfully elected parliament, could conclude a definitive treaty with Great Britain. Nevertheless, at the end of April, Sidky Pasha announced that on May 14, 16, and 18 elections would be held in different districts of Egypt to select electors, who in turn would vote for members of Parliament on June 1. The Government prohibited campaigning on the part of the Wafd and Liberal leaders and suppressed the Opposition Arabic newspapers. But demonstrations against the Government and the elections assumed menacing proportions, requiring vigorous action of troops and police to disperse them. With the holding of the first election on May 14 occurred the most sanguinary rioting since the revolt of 1919. In Cairo, where government agents sought to force citizens out of their homes to vote, troops fired upon frantic mobs, which retaliated; casualties included 86 killed and over 500 wounded. In villages and towns throughout the country, polling booths were attacked or boycotted by a large majority of the population, according to foreign correspondents, and clashes only less severe than those in Cairo were reported from numerous points. Similar, but somewhat less intense, rioting marked the subsequent elections on May 16 and 18.

At the end of the elections Sidky Pasha an-

nounced that 1,541,315 voters, or 65 per cent of those eligible, had gone to the polls, while the Opposition leaders declared that scarcely 6 per cent had voted. The reports of foreign correspondents seemed to substantiate the Opposition leaders. Nahas Pasha openly charged that the Government used fraud and intimidation to secure the election of handpicked electors. On June 1 the electors, each of which was supposed to represent 100 voters, gave 119 seats out of the 150 in the new Chamber of Deputies to members of the two Conservative parties supporting Sidky Pasha and King Fuad. About 10 per cent of the electors refrained from voting. King Fuad opened the new Parliament with customary pomp and ceremony on June 20 and the Sidky Government, apparently assured of a long lease of life, proceeded to reinforce its restrictions upon the press and upon Wafd activities. Parliament was prorogued on July 21 remaining in recess until December.

With the country firmly in the grip of the King and his Ministers, there ensued a period of unusual political quiet, partly attributed to the precedence which economics was taking over politics. This was due primarily to the low price of cotton, which had adverse effects throughout Egypt. King Fuad convened the second session of Parliament December 17. His speech from the throne called for high tariffs, the limitation of cotton acreage, establishment of an Egyptian air force, and the renewal of treaty negotiations with Great Britain. The latter point brought forward the important question as to whether the British Government would recognize the new Parliament as legitimate, or insist upon the election of a more representative Parliament prior to the resumption of negotiations for a final treaty settlement.

**OTHER DEVELOPMENTS.** Following the abandonment of the gold standard by Great Britain earlier in the month, Egypt on September 27 took similar action by prohibiting the export of gold. The step was taken to prevent the general dislocation of trade resulting from the fluctuations in Egyptian currency, which by an agreement concluded in 1923 was linked with the pound sterling. The Government at the same time announced that it planned to pay the Egyptian consolidated debt on a non-gold basis. The French representative on the Public Debt Commission notified Premier Sidky Pasha November 5 that he would file suit in the Mixed Courts to compel the Government to pay interest on the Egyptian unified preference debt bonds in gold. Faced with the prospect of declining revenues and a budget deficit of between \$20,000,000 and \$25,000,000 in 1932-33, the Government in December, 1931, submitted to the General Assembly of Mixed Tribunals, representing the capitulatory powers, a proposal for the taxation of foreigners in Egypt. New taxes on natives were also proposed.

A photographic air survey of an area of 30,000 square miles in the Sudan was completed in 1931. One result of the survey was a proposal for the diversion of the Nile waters through a 350-mile by-pass to eliminate the loss of water in the absorbent sands of the so-called sudd area of the Eastern Sudan. In return for his renunciation of all claims to the Egyptian throne, the Government granted ex-Khedive Abbas Hilmi an income of £E30,000 annually for life, beginning Jan. 1, 1931. See RECLAMATION and ARCHÆOLOGY.

**ELECTRICAL ENGINEERS, AMERICAN INSTITUTE OF.** A national organization representing the electrical engineering profession, founded in 1884. The objects of the institute are the advancement of the theory and practice of electrical engineering and of the allied arts and sciences, the maintenance of a high professional standing among its members, and the development of the individual engineer. It is governed by a board of directors, elected by the membership, consisting of a president, the 2 junior past presidents, 10 vice presidents, 12 directors, and a treasurer. In 1931 there were 60 sections of the institute located in various cities throughout the United States and 109 branches in colleges giving courses in electrical engineering. Three annual conventions are held, in addition to regional, local section, and branch meetings. The 1931 winter convention was held in New York City, January 26-30; the summer convention in Asheville, N. C., June 22-26; and the Pacific Coast convention at Lake Tahoe, Calif., August 25-28. Much of the institute's work is accomplished through its standing and technical committees, of which there were 41 in 1931. It maintains, in cooperation with other national engineering societies, the engineering societies library and a national employment service. There are three grades of members as follows: Associate, member, and fellow. The total membership on Oct. 1, 1931, was 18,178.

The principal publications of the Institute are the monthly *Electrical Engineering*, the quarterly *Transactions*, the *Standards of the A. I. E. E.*, and the *Year Book*. The medals awarded by the institute in 1931 included the Edison Medal, to Edwin Wilbur Rice, Jr., honorary chairman of the board of the General Electric Company at Schenectady, N. Y., for "his contributions to the development of electrical systems and apparatus and his encouragement of scientific research in industry"; the Lamme Gold Medal, to Giuseppe Faccioli, associate manager and works engineer of the General Electric Company at Pittsfield, Mass., for "his contributions to the development and standardization of high voltage, oil-filled bushings, capacitors, lightning arrestors, and numerous features in high voltage transformers and power transmission"; and the John Fritz Medal, to Rear Admiral David Watson Taylor, U.S.N., for "outstanding achievement in marine architecture, for revolutionary results of persistent research in hull design, for improvement in many types of warships, and for distinguished service as chief constructor of the U. S. Navy during the World War." The Commission of Washington Award for 1931 was voted to Dr. Ralph Modjeski for "preëminent service in advancing human progress."

The officers of the institute elected for 1931-32 were: President, C. E. Skinner; junior past presidents, Harold B. Smith and W. S. Lee; vice presidents, H. V. Carpenter, G. C. Shaad, I. E. Moulthrop, H. P. Charlesworth, T. N. Lacy,

A. W. Copley, W. B. Kouwenhoven, W. E. Freeman, P. H. Patton, and L. B. Chubbuck; directors, J. Allen Johnson, A. M. MacCutcheon, A. E. Bettis, J. E. Kearns, F. W. Peek, Jr., C. E. Stephens, A. B. Cooper, A. E. Knowlton, R. H. Tapscott, L. W. Chubb, H. R. Woodrow, and B. D. Hull; national treasurer, W. I. Slichter; national secretary, F. L. Hutchinson. Headquarters are in the Engineering Societies Building, 33 West Thirty-ninth Street, New York City.

**ELECTRICAL INDUSTRIES.** The steel mills of the United States were preparing themselves for the next period of activity by putting in new, electrically operated apparatus and devising new methods of operation. One electric manufacturer alone supplied in 1931, 90,000 horse power in electric motors of various sizes to the steel industry. The largest motor was of 8000 horse power, operating at 40-100 r.p.m. and capable of giving instantaneous outputs of 22,000 horse power. Two 7000 horse power blooming mill motors were sold to U.S.S.R. (Russia). One installation in the United States was a slabbing machine using two 5000 horse power and one 2500 horse power motor. A new ore bridge at the Edgar Thompson Steel Works had a span of 190 ft. between rails and a bucket capacity of 17 tons of ore. The bridge can supply 100 tons of ore per hour to its four blast furnaces and moves along its track at a speed of 2.9 ft. per second.

Among new electric furnaces installed were: a Heroult furnace for the Ford Motor Company, capable of making 15 tons of high grade steel in one and one-half hours, and a 40-ton capacity three-phase arc furnace for Japan.

The rapid development of the application of electric heating in industry seemed little affected by adverse business conditions. Large, three-phase arc furnaces were built for the melting and refining of metals, a 750-kw. induction furnace for non-ferrous metals and a 1250-kw. induction furnace for steel were built to operate at high frequencies (900 cycles). There was a considerable application of resistance furnaces for the annealing of high grade steel because of the accuracy of the time and temperature control by electrical means.

Because heating devices can be, and usually are, operated at times of the day when the other demands for power are low, or "off-peak" in the technical term, the public utilities were offering better rates both for industrial and domestic heating devices. Heating devices were being urged for the home. The ironing machine, dish and clothes washers, and electric cooking ranges were being vigorously pushed by the electrical industry following the great success of the electric refrigerator. Great scientific and technical advances have been made in the heating units for these devices. New metals for the heating resistance have been devised and these are cast in solid aluminum, thus protecting the hot resistance wire from oxidation, dirt, vibration, and mechanical injury. An unusual heating device was the "Fever Machine" which by means of a very high-frequency radio-electric field induces a fever in any part of the human body placed in the influence of the machine. It was claimed that this was a cure for some ailments and the medical profession was studying the effect of the phenomenon.

The vacuum tube has assumed a very important rôle in industry as a device to control and

operate larger devices. The three-element tube with mercury vapor known as a "Thyratron" or "Grid Glow Tube" has the ability to respond to very minute changes of voltage or current and produce much greater effects which may be used to open or close an ordinary electrically operated switch. The "Photo-electric Cell" has the ability to respond to changes in the amount of light it receives and produce a small change in the current in the circuit in which it is connected. Thus a control is built up which will turn on the street lights when it gets dark and turn them off when daylight returns. The diminished light causes the photo-electric cell to give a diminished current, this diminishing current affects a thyratron which causes a big change in its current and this large current-change closes the switch which supplies all the lights. There have been many other less simple and more important applications, such as controlling furnaces, opening doors, controlling theatre lighting, and it has been quite popular in the dramatic feature of having some prominent personage start up a plant many miles away by passing his hand over a tube as he sits at his desk.

The remote control of machinery and the reading of instruments may be accomplished by the above method or by a more general method of sending high frequency or radio currents over the same wires that carry the main power current. This is "Carrier Current" or wired radio. Many substations were installed during the year in accordance with this plan. Some pumping stations of considerable power on an oil pipe line in the Middle West operate in this manner.

Electric welding continued to develop in usefulness. Several large buildings, including two high office buildings in Wilmington, Del., and Dallas, Texas, and many factories were put together by welding instead of riveting. The makers of high pressure steam boilers found it advantageous and it was very generally used in the manufacture of electrical machinery. By the end of the year 100 cities and towns had included provisions for welded buildings in their regulations.

A great increase in the speed of elevators has been accomplished (1200 feet per minute or 14 miles per hour) without discomfort to passengers, by a careful study of the rate of change of the acceleration used. It was claimed that a high rate of acceleration was not necessarily a cause of discomfort, but sudden changes in the rate of acceleration or deceleration were unpleasant. The use of two elevator cars in one shaft, one above the other, either in one mechanical structure or entirely independent and interlocked electrically so they cannot collide, was being adopted. Automatic self-leveling at stops had become the rule in all new high class elevators.

In aviation the most popularly known advance was the completion of the dirigible *Akron* for the U. S. Navy. This was most completely equipped with electrical apparatus including auxiliary motors, lighting, radio, searchlights, cooking and control apparatus. This was all supplied from two 11-kw. 115-volt direct-current generators driven by gasoline engines. For the heavier-than-air type of airplane, new devices put in use were: Automatic directional control in combination with a magneto-compass, altitude control by means of a gyroscope, and a new "Sonic Altimeter" which indicated altitudes from 5 to 100 feet by means of a sound echo; the

ELECTRIC FURNACE OF THE HEROULT TYPE FOR MAKING STEEL

time between the original whistle and the return of the echo is nicely timed electrically and translated into feet by a special indicating instrument.

The telechron principle of clock control was extended to the operation of many devices that have to follow a definite time schedule, including traffic control, and heating devices. A convenient help to the lumber industry was developed which indicates the wetness or "moisture content" of any piece of wood by means of the electrical resistance of a portion of the surface. It is in the form of a two-bladed hatchet with the two blades electrically insulated from each other and connected by wires to an indicating instrument which measures the resistance of the wood between the blades and translates the resistance into "moisture content."

The potential applied to X-ray apparatus was increased to 70,000 volts for portable apparatus, to 900,000 volts for practical installation, and millions of volts for research work.

#### ELECTRICAL MARINE ENGINEERING.

In electrical marine transportation there was notable engineering achievement and considerable activity. The most noteworthy additions were the two ships *President Hoover* and *President Coolidge*, put into service by the Dollar Line between New York and Manila. These two are sister-ships, both having turbo-electric drive with synchronous motors. One equipment was supplied by the General Electric Company and one by the Westinghouse Company. The *President Hoover* is a passenger liner of 33,500 tons, 654 ft. long and 32 ft. draft. It is equipped with two turbo-electric generator sets of 10,100 kw. rating at 2060 r.p.m., which use steam at 275 lbs. pressure. There are two propeller shafts, each having a synchronous-induction motor of 13,250 h.p. at 133 r.p.m., the propeller speed. With 26,250 h.p. the vessel made 20.83 knots with an oil fuel consumption of 0.87 lb. per shaft h.p. hour. On the acceptance trial the vessel developed a speed of 22 knots with 32,872 h.p. These two vessels have 3000 h.p. in auxiliary motors for operating and loading the ship, and to supply these and the lighting and cooking, there are four auxiliary turbo-generator sets of 500 kw. giving direct current at 240 volts.

The U. S. Mail S. S. Co. was building six ships, of which two were completed during the year, the *Talamanca* and *Segovia* (later injured by fire). These ships are 440 ft. long, designed to operate at 17.5 knots, and each has two 5500 h.p. synchronous motors for 125 r.p.m. The synchronous-induction motor is a combination design which starts and operates at fractional speeds as an induction motor with its ease of speed control, but at high speeds operates as a synchronous motor with a high efficiency and a high power factor.

The *City of Flint*, a car ferry of the Pere Marquette Railway with turbo-electric drive, operated 364 days and 101,000 miles without interruption in the waters of northern Lake Michigan where frequently she had to plow through ice. Other new turbo-electric vessels were the yacht *Corsair*, the *Morro Castle*, and several new U. S. Coast Guard vessels of 2000 tons and 3200 h.p. In Europe there were the two P & O liners in England, each of 28,000 tons for a speed of 22 knots, and in France there was building the *Ile de France* to be propelled by steam-electric drive. In all, there was over 1,000,000 h.p. of electric motors installed for electric ship drive in 1931.

Much attention was given to the electric drive of auxiliaries on board ship. The design of the motors was improved to make them particularly suited to the purpose with especial attention given to protection from water, be it waves, splash, or merely the moisture in the air. As a consequence, there was a great increase in motor drive for auxiliaries on all new ships, even on the straight steam driven type. For smaller installations, particularly where ease and quickness of handling were important, the "Diesel-electric drive" was installed. Typical of these is a dredge for the city of St. Louis which has an aggregate of 3000 h.p. in motors for propelling, pumping, cutting, for the winches, and for the hoists. This equipment is also unusual in that the alternating current system is used, while most Diesel-electric plants use direct current. See SHIP-BUILDING.

**ELECTRICAL TRANSMISSION AND DISTRIBUTION.** The principle of operating electrical systems as a network, which was adopted for secondary distribution some years ago with the advent of the "Network Protector," was extended not only in secondary distribution, but in primary transmission systems. In this, the transformers, located at strategic places, which supply the 110-220 volts for the houses, receive their power from a network of 4400-volt feeders interconnected so that the current may find two or three paths to any one transformer. Thus if any feeder is injured, no one transformer or locality is without power. In the same way, there were "Vertical Networks" in tall office buildings, each building being treated like a city block put up on end in the air. In all these systems the automatic load ratio control transformer plays an increasingly important rôle.

In long transmission lines 220,000 volts was still the highest voltage in commercial use, but experiments were being carried on which would make it possible to operate at 330,000 volts when economically justified. The principal difficulties were still from lightning, but much valuable information was being accumulated by many correlated scientific investigations all over the United States. These investigations were of two kinds. First, getting records of the rise and fall of the voltage and current due to a real lightning stroke, by means of "Lightning Recorders" or Surge Indicators using the principle of the cathode ray oscillograph. In these tests, records of lightning strokes have shown values as high as 5,000,000 volts and 50,000 amperes, all occurring within an interval of a few millionths of a second. Second, applying artificial lightning of 1,000,000 to 5,000,000 volts from artificial lightning generators and recording its effects on various types of construction.

Protection from lightning was improved by advances in the design of the "Thyrite" and "Auto-valve" lightning arresters which had been adapted for high voltage lines. These use stacks of many plates or discs in series, each coated with a peculiar oxide which lets the lightning voltage through but stops the power current. The "Deion" principle was applied to the protection of individual insulators in exposed places. This takes the lightning discharge away from the insulator and quenches the arc when the line has discharged the lightning potential. The beneficial effects of an overhead "ground wire" were confirmed.

Improvements were made in oil circuit breakers by details of design in which a blast of cool

oil was forced directly across the path of particles of the arc at the instant that the current passed through its zero value. The "Deion" circuit breaker, described in the 1929 YEAR BOOK, was improved and was built in larger sizes for any voltage. This operates on the principle of the quench-gap.

Circuit breakers of any type may now be operated by "Thermostrip," as well as an overload coil. The thermostrip is a thermostat which operates after a moderate overload has existed for a certain period of time. Thus protection from overload as well as short-circuit is obtained.

The commercial use of oil-filled cables for underground transmission increased with addition of several new installations operating at from 66,000 to 132,000 volts.

The extension of electric transmission and distribution into rural districts for "Farm Electrification" was receiving much attention and encouragement. There were 650,000 farms in 1931 receiving electric service from central stations and 300,000 using electric current provided by small isolated generating sets.

Telemetering is a new term for a rapidly increasing practice of reading the indications of a number of instruments in a distant station without an attendant. It is usually accomplished by carrier currents and may be used to read volts, amperes, power, water, gas, and oil pressure and temperatures. By a similar means one "Load Dispatcher" for the new subways in New York City will control 89 substations containing 24 synchronous converters, 99 rectifiers, 202 ventilating fans and 817 circuit breakers.

**ELECTRIC LIGHT AND POWER INDUSTRY.** For the year 1931, the output of the electric central stations of the country was 87 billions of kilowatt-hours, a drop of 3.75 per cent from 1930, but there was an increase of 0.65 per cent in the income \$2,137,000,000, due to an increase in the number and demand of small customers and a decrease in the demand of industrial customers usually taking large units. There were a number of reductions of rates to small customers to encourage a greater use of domestic electrical appliances. The average rate for the whole country was 6.33 cents per kw-hr. in 1929, 6.03 cents in 1930, and 5.87 cents in 1931.

The total generating capacity of the central stations increased from 32,500,000 kw. in 1930 to 35,000,000 kw. in 1931 and of this latter figure, 25,000,000 kw. were obtained from steam prime movers and most of the balance from water wheels.

The Electric Light and Power business had become thirteenth in size and importance of the industries of the United States, employing over 230,000 people, having an investment of \$10,000,000,000 and doing a business of over \$2,000,000,000 per year. The revenue for 1931 was given as \$2,137,000,000. This makes the average price at which all the output was sold to be 2.46 cents per kw-hr.

The rate of consumption of coal per kw-hr. had been brought down from 4.4 lbs. in 1912 to 1.62 in 1930 and 1.56 lbs. in 1931. The investment per kilowatt of capacity had gone up to \$370 and the investment per customer to \$470.

The most interesting additions to the plant capacity of the industry were the two 200,000 kv-a. 60-cycle units for the Brooklyn Edison Company and the 115,000 kv-a. unit for the Pub-

lic Service Company of Northern Illinois. The Niagara-Hudson System increased the capacity of its Huntley steam-electric station in Buffalo to 622,000 horse power which was a greater capacity than all of the hydro-electric stations on the American side of Niagara Falls, and more than one-third of the total of 1,600,000 horse power in all the hydro-plants now installed on both sides of the river.

The principal developments in steam driven units were an increase in boiler pressure and steam temperature giving an increase in economy (See BOILERS), a decrease in floor space required per unit of power, and a reduction in weight of sets to about 15 lbs. per kv-a. Interconnection of plants and systems progressed, an example being the proposed interconnection of the New York Power and Light Co., with the New York Edison Co., at Peekskill, making it possible to exchange power between the territory around Albany and the plants of New York City.

The use of outdoor installations increased, transformers, synchronous condensers, and motor generators being constructed which required no building for protection, and the use of outdoor switching stations was quite general.

Among hydro-electric stations, new ventures were the Diablo plant for the city of Seattle with two generators of 77,000 kv-a. capacity at 171 r.p.m., the largest water wheel generators in the United States, and operating with the record head of 327 feet of water; the Safe Harbor plant to supply the city of Baltimore in which there were four generators of 31,000 kv-a., and which was planned for an ultimate capacity of 510,000 kv-a.; and the Osage River development in Missouri, with six generators of 27,500 kv-a. capacity. The civil engineering features of this plant involve a reservoir covering 95 square miles.

The Muscle Shoals plant was still awaiting the decision of the politicians before becoming useful. Work on the Boulder Dam started and contracts were concluded for the sale of some of its output at 0.163 cent per kw-hr. as measured at the switch-board of the generating station. The St. Lawrence River Development was still in the political stage, but meanwhile the Beauharnois plant on the Canadian side was progressing with its plan for an ultimate capacity of 500,000 horse power and two of the first six 50,000 horse power units were installed.

A unique incident was the use of the U.S.S. *Lewington*, airplane carrier, with its 160,000 kv-a. electrical installation, to help supply the city of Tacoma with electrical energy when the plants of the local system failed because of low water in the rivers due to drought.

Quite similar was the floating power station S.S. *Jacona*, which carries an electrical power plant of 20,000 kv-a. capacity which may be connected to the system of any seaboard city and give additional power. It was owned and operated by one of the public utilities of New England and was moved from city to city as needed.

**ELECTRIC LIGHTING.** There were sold in 1931, 557,000,000 incandescent lamps of which 350,000,000 were the large-sized lamps with metal filaments, 203,000,000 miniature metal filament lamps, and only 4,800,000 of the old carbon filament type. These figures are about the same as for 1930 but are slightly less than those for 1929. A change was made that affects many homes in that the 40-watt size was being made of the gas-

filled type with its better economy, while the 50-watt size was no longer sold. A five-watt lamp for 115 volts, the usual home system, was brought out. This was the smallest size available for 115-volt circuits, as small sizes require filaments so frail that they are difficult to produce and to handle in the making of the lamp. The filament for this 5-watt lamp is so fine that it cannot be seen by the eye until it is coiled into the spiral in which form it is used in the lamp.

There were several new types of lamps put on the market for the purpose of giving ultra-violet rays for therapeutic purposes, and some of these had the improvement of not requiring a transformer and were therefore more convenient and were less cumbersome. The so-called Sun-lamp with its special correx glass bulb, which, it was claimed, prevents danger from excessive action, was improved and two forms became available: the larger size with an inside-frosted bulb which protects the eyes, and a smaller size which has a small screen in the line of sight in order to protect the eyes. It was claimed for the correx glass that it will not transmit the dangerous rays of light, or in scientific words, it cuts off all radiations of a wave-length less than 2800 Angstroms, —an Angstrom being one ten-millionth of a millimeter. Light of shorter wave-length than this is regarded as being unusual and dangerous, while light of greater wave-length is found in the usual bright sunlight.

The "Windowless" building had arrived and being quite favorably considered for factories which use materials affected by changes in air conditions, such as moisture and temperature. Such a building in Fitchburgh, Mass., had a lighting system combining incandescent lamps and mercury lamps in groups, and the combination gives a light which resembles daylight. The ventilating system is very elaborate and the air is given the proper and constant temperature and humidity before delivery to the rooms.

Many new ideas were being introduced in interior illumination. The scheme of illumination as well as the lighting fixtures were made use of as part of the decorative scheme of the building and were made a part of the architectural scheme, both inside and outside. Many new buildings were built with a flood-lighting system as a permanent part of the exterior architectural decorative scheme.

It has become the practice to plan the illumination, the fixtures, and the wiring at the time the original plans of the building are made, and to recognize the illuminating system as one of the major parts of the building. Formerly it was the custom to leave the arrangements for the lighting system until after the plans of the building proper had been completed. The new practice is known as "built-in" lighting.

The National Electric Light Association prepared a set of standard specifications of minimum requirements for house-wiring which should make it easier for the home-builder to plan the electrical wiring of his house with proper protection against the risk of fire and shock.

An experiment was started in a school in New Jersey to investigate the beneficial effect of a constant high level of illumination in the school rooms where children work and study. The artificial illumination supplied provided an intensity of 30 foot-candles on all desks (10 foot-candles is high for the average home) and a photo-electric cell was installed to turn on the

electric lights automatically whenever the illumination by daylight falls below 25 foot-candles.

An entirely new scheme of lighting and lighting control was installed in a New York theatre which gives much more prominence to lighting effects and introduced the "Lighting Director." This rôle is filled by the electrician who sits out in front near the leader of the orchestra and controls all the lights in the theatre, both backstage and in the auditorium. There are 50 main groups of lights, each group sub-divided in minor groups by colors. These are turned on and off and graduated through all degrees of brightness on a master keyboard in front of the director. Very small switches here operate electron tubes which control the major currents and all the power apparatus, the latter being placed out of the way in an appropriate place. A total of 200 watts at the keyboard was all that is required to control the 367,000 watts for all the lamps.

For street lighting, the tendency has been to raise the level of illumination particularly where traffic is dense or dangerous, as well as for the sake of display. Data were being accumulated tending to show a definite correlation between points of frequent street accidents and poor illumination. An interesting new example of unusual street illumination was in Buffalo where an installation of luminous arc lamps gave an illumination of 1122 lumens per linear foot of street. The Illuminating Engineering Society had prepared a *Code of Street Lighting* for the help of municipalities in city planning.

There were quite a number of athletic fields and stadia equipped with a scientifically designed system of artificial illumination so that not only may the players see, but a large group of spectators may also enjoy sport outdoors at night.

Among minor miscellaneous developments were: the general use of photo-electric cells for the testing of incandescent lamps; the use of the photo-electric cell for sorting packages by their color or marking; large water-cooled incandescent lamps for moving-picture studios; the "photo-flash lamp" for taking flashlight photos. This contains aluminium foil in a rare atmosphere of oxygen properly proportioned to consume the aluminium by combustion but without explosion. The lamp is set off by a small electric current, the flash lasts an interval of about 1/20 second, and gives an illumination equivalent to two hundred and fifty 500-watt lamps.

Of purely scientific interest was the new sodium gas-lamp which uses sodium vapor as the usual window-display lamp uses neon gas, but gives a light more suitable to the eye and much more economically. The practical difficulty as yet is that the sodium attacks the glass, and the life of the lamp is short. See **ELECTRIC INDUSTRIES**.

**ELECTRIC RAILWAYS.** The principal activity in the transportation field during the year was among the steam railroads, there being only very minor progress among the electric urban and interurban roads. The Pennsylvania Railroad was the outstanding example in its electrification of the main line from New York to Washington. The New York-Philadelphia section at the end of the year was completed except for the gap between Newark and Trenton. The 11,000-volts single-phase trolley had been installed in the New York terminal, but the 600-volt third-rail was to be left for the use of multiple unit suburban trains. This road already had completed or had under construction 150 electric locomotives, 90 passen-

ger, and 60 freight. The passenger locomotives are known as the P-5 and are of 190 tons each, having six single-phase motors of 625 h.p. each making 3750 h.p. There are three driving axles with 115 tons on drivers. The locomotives can operate at 90 m.p.h. The freight locomotives rate at 2500 h.p. and can haul a 5000 ton train.

The Reading R. R. equipped 50 miles of track with a new and simple catenary construction for 11,000 volts. It had 70 motor cars.

The New York Central completed the electrification of its West Side freight line in New York City and had 42 six-axle locomotives with geared motors operating on direct current at 600 volts. It also had 35 oil-electric-battery locomotives for operation in lower New York City through the streets and on the piers. These have the ability to operate either by power from an oil engine-generator, from a trolley, or third rail or from a storage battery.

The Delaware, Lackawanna & Western had its suburban service well in operation as far as Dover with motor-car trains operating from its 3000-volt direct current trolley supplied by mercury arc rectifier substations. The Great Northern Railway put in service several large locomotives of a new kind. The overhead trolley is for 11,000 volts single-phase and a motor-generator set on each locomotive changes this to direct current at 600 volts for the traction motors. The New Haven R. R. added 10 new high speed passenger locomotives and 24 motor cars and had 577 miles of electrified track. See RAILWAYS.

New York City purchased 500 new motor cars for its new Eighth Avenue Subway. The cars were to run in 11-car trains and each car would be a motor car having two 190 h.p. motors. This installation also includes the largest installation of rectifier substations, consisting of 50 substations aggregating 153,000 kw. capacity of rectifiers, as well as 5 converter substations aggregating 53,000 kw.

There were a number of new gas-electric cars put in operation on steam roads, the most notable being one of 900 h.p. on the Santa Fe. It was claimed for the 57 cars of this type, which had been operated for several years on the Burlington road, that the cost of operation was 36 per cent less than that of steam trains.

Among the trolley roads there were introduced two new types of cars. The light-weight high speed cars for urban service weigh about 20 tons each and are equipped with four 35 h.p. or 50 h.p. motors with double reduction or worm drive and give higher acceleration with more smoothness due to improved control. The new light-weight high speed interurban cars for long distance have four 100 h.p. motors giving a speed of 80 m.p.h., have a streamline design and are equipped with magnetic track brakes. The Cincinnati and Lake Erie Railway was an example. See RAPID TRANSIT.

The trolleybus increased its hold on popularity, there being 225 in operation at the end of 1931. These operate by electric motors taking power from an overhead trolley, but require no track and weave in traffic and draw up to the curb to make a stop, like an automobile but with lower cost of operation than trolley cars.

**ELIOT, SIR CHARLES (NORTON EDGEUMBE).** A British diplomat and author, died at sea Mar.

16, 1931. Born in 1862, he was educated at Cheltenham and at Balliol College, Oxford, and became a fellow of Trinity College, Oxford. He entered the diplomatic service in 1886, serving as third secretary of the British Embassy at St. Petersburg (1882-92) and as chargé d'affaires in Morocco (1892-93), Bulgaria (1895), and Serbia (1897). In 1898 he was appointed secretary of the British Embassy in Washington, and from there was transferred the following year to Samoa as British high commissioner. He was British commissioner and commander-in-chief for the British East Africa Protectorate and agent and consul-general at Zanzibar from 1900 to 1904.

In 1905 he resigned to become vice-chancellor of the University of Sheffield, and in 1912 was chosen first principal of the University of Hong Kong. He was British high commissioner in Siberia during 1918-19 and British ambassador to Japan from 1919 to 1926. He was made Privy Councillor in 1919, Knight of the Grand Cross of St. Michael and St. George in 1923, and a member of the Imperial Academy of Japan in 1926. In addition to papers on marine zoölogy, he published *A Finnish Grammar* (1890); *Turkey in Europe* (1900); *The East Africa Protectorate* (1905); *Letters from the Far East* (1907); and *Hinduism and Buddhism* (1921).

**ELLIOT, DANIEL GIRAUD, MEDAL.** See ZOÖLOGY.

**ELLIOTT, MAJ. GEN. GEORGE FRANK, U. S. M. C., RET.** An American marine officer, died in Washington, D. C., Nov. 4, 1931. He was born in Alabama, Nov. 30, 1846. Entering the U. S. Marine Corps in 1870, he was promoted to 1st lieutenant in 1878 and captain in 1892. In 1894, during the war between China and Japan, he was stationed in China to guard American interests and won distinction for the forced march made by the marine guard under his command to protect the American legation in Seoul. He commanded company C of the 1st battalion of marines during the Spanish-American War and was advanced three numbers in his grade for eminent and conspicuous conduct in the battle near Guantanamo. He served in the Philippines during 1899-1900, commanding the marines in their first major engagement at Novalleta. In 1903 he was made commandant of the U. S. Marine Corps, with the rank of brigadier general, and until March, 1904, commanded the expeditionary brigade of marines on the Isthmus of Panama. He was advanced to major general in 1908 and was retired two years later.

**ELM DISEASE.** See FORESTRY under *Insects and Disease*.

**ELMIRA COLLEGE.** An institution for the higher education of women in Elmira, N. Y., founded in 1852 and operating under its present charter since 1855. The enrollment for the autumn of 1931 was 502. There were 60 members on the faculty. The endowment of the college amounted to 1,147,248; and the income for the year was \$431,251. There were 35,000 volumes in the library. President, Frederick Lent, Ph.D., D.D., LL.D.

**ELTINGE, BRIG. GEN. LE ROY, U. S. A.** An American soldier, died in Omaha, Neb., May 14, 1931. He was born in South Woodstock, N. Y., Sept. 17, 1872. On graduation from the U. S. Military Academy in 1896, he was commissioned 2d lieutenant in the 4th cavalry and was promoted through the grades to brigadier general

in 1924. He saw service in the Philippines during 1898-99 and 1901-03 and was with the Army of Cuban Pacification during 1906-07 and on the Mexican border in 1914 and 1916.

During the World War he was assigned to the general headquarters of the American Expeditionary Forces, being in charge of the operations section of the general staff until May, 1918, and thereafter deputy chief of staff. In 1921 he was sent to Manila as assistant chief of staff of the Philippine Department, and on his return in 1924 made assistant chief of staff in the war plans division at Washington. He received the Distinguished Service Medal and the Croix de Guerre with palm, and was made a companion of the Order of the Bath (Great Britain) and a commander of the Legion of Honor (France), of the Order of the Crown (Belgium), and of the Order of the Crown (Italy).

**EMERSON, HARRINGTON.** An American efficiency engineer, died in New York City, May 23, 1931. He was born in Trenton, N. J., Aug. 2, 1853, and attended the Royal Bavarian Polytechnic Institute in Munich, Germany (1872-75) and universities in Italy and Greece (1875-76). After acting as instructor in modern languages at the University of Nebraska during 1876-82, he became engaged in banking and real estate operation. He was one of the first to advocate the adoption of efficiency methods in business and industry, and in 1900 founded the Emerson Engineers in New York City so as to carry out these ideas. He remained as president of this firm until 1923. During 1898-1901 he put into operation some of the first long-distance mail routes in Alaska. He also reported on all the known coal deposits of the western coast of North America and on the advisability of the northern submarine cable route to Asia, the latter report being largely followed by the War Department in laying its Alaskan cables. In addition, he gained recognition on account of the results obtained by the efficiency methods which he installed on the Atchison, Topeka & Santa Fe Railway. In 1921 he was appointed a member of the Committee for the Elimination of Waste in Industry of the Federated American Engineering Societies. He also acted as engineering and industrial counselor to various foreign governments, including those of France, Germany, China, and Soviet Russia. He was the author of *Efficiency as a Basis for Operation and Wages* (1909) and *Twelve Principles of Efficiency* (1912).

**EMIGRATION.** See IMMIGRATION; GREAT BRITAIN, ETC., under *Population*.

**EMORY UNIVERSITY.** An institution for higher learning in Atlanta, Ga., coeducational only in the upper division of the college and in the graduate and professional schools (except the school of medicine), founded in 1836. The enrollment for the autumn of 1931 was 1225, distributed as follows: College of arts and sciences, 539; school of business administration, 119; graduate school, 61; school of theology, 67; school of law, 51; school of medicine, 209; library school, 50; junior college at Oxford, 81; junior college at Valdosta, 48. The enrollment for the 1931 summer session was 809. The faculty numbered 232. The endowment amounted to \$4,559,922, and the income for the year was \$747,317. There were 129,000 volumes in the library. In the autumn of 1931, the Thomas Fiske Glenn Memorial Church was completed

and opened for use. A new dormitory was also completed on the campus of the junior college in Valdosta. President, Harvey W. Cox, Ph.D., LL.D.

**ENGLAND, CHURCH OF.** The Established Church of England. Its faith is represented in the United States by the Protestant Episcopal Church (q.v.). The King is the supreme governor of the church, possessing the right to nominate to vacant archbishoprics and bishoprics. The King and the First Lord of the Treasury also appoint to certain deaneries, prebendaries, and canonries, and the Lord High Chancellor to certain canonries. For administrative purposes, the country is divided into two provinces: The Convocation of Canterbury and the Convocation of York, each under the control of an archbishop.

The church assembly, established in 1920 "to deliberate on all matters concerning the Church of England and to make provisions in respect thereof," consists of three houses, composed of bishops, clergy, and laity, respectively, the laity being elected every five years by the lay members of the diocesan conferences, which consist of representatives elected by members of the church. Every measure passed by the church assembly must be submitted to an ecclesiastical committee, consisting of 15 members of the House of Lords and 15 members of the House of Commons. This committee reports on each measure to Parliament, and the measure becomes a law if it is passed by both Houses of Parliament. Parochial affairs are managed by parochial church meetings of parishioners and by church councils elected by such meetings.

In 1930 there were 2,401,635 East communicants in the 43 English dioceses and 12,807 incumbents. Baptisms numbered 430,021. Total parochial contributions received during the year amounted to £8,833,092.

There were many indications during 1931 that the Lambeth Conference, which made 1930 a notable year in the annals of the church, had done much to direct the attention of churchmen generally to the problems discussed by the bishops at that great gathering. Of these problems the unity of the church and the question of disarmament were particularly prominent. In January the Archbishop of Canterbury appointed representatives of the Church of England to constitute, with representatives of the Patriarchates and Autocephalous Churches of the East, a doctrinal commission to prepare a joint statement on the theological points about which there is difference

and agreement between the Anglican and Eastern Churches. The commission, the chairman of which was the Bishop of Gloucester (Dr. A. C. Headlam), concluded its sittings on October 21. The Federal Council of the Evangelical Free Churches also accepted on September 22 the invitation of the Archbishop of Canterbury to resume the conferences with representatives of the Church of England which were, by consent, suspended in 1925. The conferences were resumed on November 21, and it was hoped, to quote the archbishop's invitation, "that some further step may be taken towards at least fuller understanding and fuller spiritual coöperation, or it may be by God's will towards even closer union."

An important conference was held in Bonn, Germany, beginning July 2 between representatives of the Anglican Communion and the Old Catholic Churches. At this conference, which was an outcome of the Lambeth Conference, terms of inter-communion between the Anglican and Old Catholic Churches were accepted. The terms of the agreement provided that each communion respect the independence of the other but permit its clergy to administer the Holy Communion to members of the other communion, and further insured coöperation in the ordination of priests and consecration of bishops. The agreement, which was confined to churches in communion with the See of Utrecht, was ratified by the general congress of the Old Catholic Churches in Vienna in September. On receiving the synodical approval of the Church of England it marked the first instance since the Reformation of formal inter-communion between Anglican and non-Anglican churches. See OLD CATHOLICS.

The doctrinal position of the Church of England itself continued to be the subject of inquiry by the Archbishops' commission on doctrine. This commission was appointed in 1923 "to consider the nature and grounds of Christian doctrine with a view to demonstrating the extent of existing agreement within the Church of England, and with a view to investigating how far it is possible to remove or diminish existing differences." After its session at Cambridge from September 21 to 26, the commission was able to report "steady progress with its immense task" and that "every session receives new encouragement from the realisation of unity between representatives of the most diverse schools of thought."

The declaration of the Lambeth Conference "that war as a method of settling national disputes is incompatible with the teaching and example of our Lord Jesus Christ" was affirmed, though with varying degrees of emphasis, at many diocesan and other conferences during the year, and many leaders of the church were insistent on the paramount importance of "the grave issues for world peace which are involved in the forthcoming Disarmament Conference." Widespread attention was aroused by the sermon preached by the Archbishop of Canterbury to the congregation which filled St. Paul's Cathedral at the disarmament service on December 15. Among inter-denominational gatherings at which the subject was discussed was the conference of the World Alliance for International Friendship through the Churches at Cambridge in September.

The church assembly held its usual five-day sessions in February and June. Its most important legislative achievement was the passing of the Cathedrals Measure, which in one form or

another had occupied the attention of the assembly for more than three years. The measure provides *inter alia* for the establishment of a new statutory body, known as the Cathedral Commissioners for England. Their principal function will be to provide, by means of "schemes" under the measure, for the establishment and revision of constitutions and statutes for the cathedrals and for the administration of their property and revenues. The measure received the Royal assent on July 8.

The Royal assent was also given on July 8 to the Benefices (Exercise of Rights of Presentation) Measure, which had received the final approval of the assembly at its summer session in 1930. The measure was an attempt to provide machinery for giving to parishioners an effective voice in the appointment of their incumbent, and to bishops a discretionary power of refusing any really unsuitable nominee, while avoiding any undue restriction of the patron's right of presentation or injury to the reputation of the clergyman whose name is put forward. The "appointed day" under the measure was Jan. 1, 1932. The Ecclesiastical Commissioners (Loans for Church Training Colleges) Measure, which received the Royal assent on March 27, enables the commissioners to make loans for purposes in connection with the Church of England training colleges. The other measures which became law during the year included one bringing the bishopric of Sodor and Man within the provisions of the Episcopal Pensions Measure of 1926; two measures providing for the application to the Channel Islands of measures passed by the church assembly and for the representation of the islands in the house of laity and in the Winchester diocesan conference; and a measure enabling the ecclesiastical commissioners to make provision for certain unbeneficed clergymen who did not come within the scope of the Ecclesiastical Commissioners (Provision for Unbeneficed Clergy) Measure, 1928.

At the assembly's spring session a long discussion took place on the report of the commission on staffing of parishes. The report set out the facts relating to the admittedly grave shortage of clergy and put forward a number of suggestions as to possible methods of redistributing existing resources and of increasing the supply of ordinands. The present deficiency of clergy was estimated by the commission as 1583, and the view was expressed that "the church should aim at an ordination list of 630 per annum." The assembly resolved that the report should be referred to the diocesan conferences. Most of these conferences discussed the matter during the latter part of the year. The assembly also requested the archbishops to ask the diocesan bishops of the two provinces to write a pastoral letter, to be read at one of the Ember seasons, stating the present position as to the supply of clergy, and calling upon clergy and laity "to pray, work, and give for an increase in the ministry." The archbishops and bishops subsequently appointed the third Sunday in Advent for this purpose, when pastoral letters upon the subject were read in the majority of churches throughout England.

Difficulties as to a suitable venue prevented the holding of the church congress. No Anglo-Catholic congress was held, but a successful joint anniversary meeting was held in conjunction with the English Church Union. The 104th Isling-

ton Clerical Conference met in January, the subject for discussion being "The Church of To-day and To-morrow," and the Conference of Evangelical Churchmen held at Oxford in April considered "The Basis of Anglican Doctrine and Fellowship." "Man" was the sufficiently comprehensive subject of the Modern Churchmen's Conference, held at Oxford in September under the presidency of the Dean of St. Paul's.

The religious value of broadcast services was among the subjects discussed by the Convocations of Canterbury and York during the year, both houses of the Convocation of Canterbury putting on record their appreciation of the service rendered to the cause of religion by the British Broadcasting Company and commending to the attention of the clergy, lay readers, and choir trainers the high standard of preaching, reading, and singing attained in broadcast services. A committee of both houses of the Canterbury Convocation also was appointed to consider the bearing of Resolution 11 (marriage) of the Lambeth Conference upon the practice of the church in the province and to confer with any similar committee appointed by the Convocation of York.

There were few changes during 1931 in the episcopate. The long vacancy in the see of Worcester, caused by the death of Dr. E. H. Pearce in the preceding October, was filled in January by the translation from Bradford of Dr. A. W. T. Perowne, who was succeeded by the Rev. A. W. F. Blunt, vicar of St. Werburgh's Derby. The consecration of the Rev. Mervyn G. Haigh, appointed to the see of Coventry at the close of the previous year, took place on February 24. Bishops Suffragan consecrated during the year included Canon G. A. Hollis (Taunton) on January 6, the Rev. C. R. Hone (Pontefract) on February 2, and the Rev. E. Priestley Swain (Burnley) on November 30.

The officers of the church assembly in 1931 were: Chairman, the Archbishop of Canterbury; vice chairman, the Archbishop of York; treasurer, Col. Sir R. Williams; secretary, Sir Philip W. Baker-Wilbraham; assistant secretary, Guy H. Guillum Scott; chairman of the house of bishops, the Archbishop of Canterbury; chairman of the house of clergy, the Archbishop of St. Albans; chairman of the house of laity, the Earl of Selborne. Headquarters are at 8 Dean's Yard, Westminster, S. W. 1, London.

**ENGLISH STUDIES.** See **PHILOLOGY**, MODERN.

**ENTOMOLOGY, ECONOMIC.** The devastating outbreak of grasshoppers which occurred from New York westward to the intermountain region and centering in the Dakotas and Nebraska in the Great Plains area was perhaps the most notable event of 1931 in the field of economic entomology. The complete eradication of the gipsy moth from an area in New Jersey that in 1921 covered 400 square miles was an outstanding achievement in quarantine and control work. The successful completion of the campaign against the Mediterranean fruit fly, the world's most important insect enemy of fruits, with the discontinuance on March 31 of inspection of the formerly infested area in Florida, marks an accomplishment in applied entomology that has never been equalled.

The influence of the weather conditions that obtained in 1930 a year with a prolonged dry period and extremely hot weather throughout the central and eastern United States was re-

flected in the occurrence of insects in 1931. Many, including the chinch bug, codling moth, San Jose scale and others, were favorably affected. Others as the Mexican bean beetle, oriental fruit moth, Hessian fly and European corn borer were checked. Still others such as the white grubs were not visibly influenced.

The retirement of Dr. Leland O. Howard on June 30 after 53 years of service with the Federal Bureau of Entomology, 33 of which were as Chief of the Bureau, was an event of particular interest. Following his retirement the Capper Prize for 1931, consisting of a gold medal and \$5000, was awarded to Dr. Howard for his distinguished service to American agriculture in perfecting insect control measures. The year saw the passing of Prof. John H. Comstock (q.v.), for more than 50 years a leader and teacher in the field of Entomology, on March 20 at the age of 82. He was the author of many publications including several standard textbooks.

**CODLING MOTH.** Severe infestations of the codling moth, the most important insect enemy of the apple, were quite general in the eastern part of the United States. Counts made of collections under bands in Illinois indicated that the population was from 10 to 25 times as great as at the same time in 1930. The side-sting injury of the apple was observed at harvest time to be unusually prevalent throughout the New England and Middle Atlantic States, and across the lake region into Minnesota and Iowa. The extensive work with chemically treated corrugated paper bands has shown that they can be applied successfully as a supplementary control measure. Their use in Indiana almost entirely prevented adult emergence or more than 98 per cent of the larvæ captured. Bait traps kept in orchards in Missouri and filled with a ferment caught large numbers of the moths each night when they were emerging; it is thought that these may prove to be a valuable aid in worm control. The egg parasite *Trichogramma minutum* was used in experimental control work, as many as 30,000 being shipped daily and distributed in orchards in Colorado.

**ORIENTAL FRUIT MOTH.** The unfavorable weather conditions of 1930 and the dissemination and increase of parasitic enemies appeared to have combined in reducing the numbers of the oriental fruit moth, which was much less serious in 1931. Encouraging results were obtained from control work with parasites. Mass production and distribution of the most important parasite of the larva, *Macrocentrus ancylivora*, were commenced by the Federal Bureau of Entomology in 1929 from the field laboratory in southern New Jersey. Up to the close of 1930 adults had been produced and successfully shipped and liberated in 86 colonies in 13 States. Preliminary recovery collections indicated establishment in slightly less than one half of the colonies liberated. The egg parasite *Trichogramma minutum* produced in mass and liberated in infested orchards was found to infest a high percentage of the oriental fruit moth eggs.

**SAN JOSE SCALE.** The destructive San Jose scale, enemy of fruit and other trees and shrubs, is on the increase in the East Central States, on the Atlantic seaboard from Pennsylvania to Georgia and westward over the Gulf region. It was more abundant in the apple orchards of the Niagara peninsula, Ontario, than for many years.

**MEDITERRANEAN FRUIT FLY.** The campaign

against the dreaded Mediterranean fruit fly in Florida, which was begun in April, 1929, when an infestation was found in Orange County, was brought to a successful close on March 31 when Federal inspection of the formerly infested areas was discontinued.

**MEXICAN FRUIT FLY.** An infestation of the Mexican fruit fly which attacks citrus fruit was found in April in a small lot of grape fruit in storage that had been grown near Mission, Tex. This was the first discovery of the pest in the United States since Nov. 10, 1929, when it was found in three back yards in Brownsville, Tex. It was thought that the infestation may have persisted since the original discovery in the United States in 1927. The greatly enlarged acreage and greatly increased tonnage of citrus, both constantly expanding, make more difficult the control work, which has included inspection, certification, clean culture and a host-free period of six to seven months.

**JAPANESE BEETLE.** The spread of the Japanese beetle continued, a few individuals having been found at Charleston, South Carolina, and a single beetle at Cleveland, Ohio. The beetle was generally distributed as far north as Plainfield and Metuchen, New Jersey, with localized colonies beyond this region. A local and serious infestation that was discovered in western Connecticut during the summer was traced to a quantity of sod moved to the estates the preceding summer from New Jersey. It was possible to establish the identity of those responsible for the shipment and fines aggregating \$290 were paid for violation of the quarantine law.

**EUROPEAN CORN BORER.** There were reductions in abundance in the one-generation area of the European corn borer extending from New York and Pennsylvania westward, resulting from the unfavorable climatic conditions of 1930, which averaged 25 per cent. Although the general spread was less than normal more isolated infestations were found in 1930 than any preceding year. In order to prevent the spread to the west and south of the two-generation or more important form, the regulated area under quarantine was extended on January 23 to include New York City and parts of New York State and New Jersey. Since the one-generation strain had reached the two-generation area in Massachusetts and New Hampshire, no further attempts were to be made to retard the spread of the one-generation form in New England.

The outbreak of the borer in the corn-growing counties of Ontario that commenced in 1920 and which resulted in the devastation by 1926 of all the corn within an area of 1200 square miles had as a result of the extensive cleanup each spring been reduced until the farmers felt that they could again grow corn and escape the extensive damage.

**MEXICAN BEAN BEETLE.** The Mexican bean beetle was found as far east as Washington County, R. I., in fields in southern New Jersey and on the eastern shore of Maryland. Considerable damage was done by the first generation in Connecticut but in the older infested region in the southern Middle Atlantic States there was comparatively little damage. It caused considerable injury in North Carolina and had by May extended its range southward to Albany, Ga., 37 miles south of the record for 1930.

**GIPEY MOTH.** The apparently complete extermination of the gipsy moth in New Jersey

which covered an area of 400 square miles in 1921, in which year 3,000,000 egg clusters were found, was an outstanding achievement in quarantine and control work. Substantial progress was made in the cleanup and eradication work with the infestation on Long Island. In the work in the barrier zone in New England and New York somewhat fewer infestations were found with indications that marked progress had been made in cleaning up infested locations.

**SATIN MOTH.** The continued spread of the satin moth resulted in the prohibition on December 1 of interstate movement into uninfested territory of poplar and willow trees and parts thereof capable of propagation from 51 additional towns and municipalities in Maine, Vermont, Massachusetts, and Connecticut, representing 155 square miles of territory. The amount of defoliation in June was less than in 1930, due partly to migration from densely infested areas, effectiveness of spraying, and the rather heavy winter mortality.

**ALFALFA WEEVIL.** Surveys under way in July indicated that the damage from the alfalfa weevil would, except in western Nevada and northern Utah, be almost negligible. It appeared at Casper, Wyoming, in increased numbers, in some fields the foliage of the first cutting being practically destroyed. Control measures were necessary in western Nevada.

**PINK BOLL WORM.** The eradication work with the pink boll worm in the long lint cotton fields of the Salt River Valley of Arizona failed of the success desired due to the discovery that the infestation extended over a much larger area of the State than was anticipated. Because of the discovery of many slight, widely scattered infestations the maintenance of the non-cotton zone was deemed impractical and the non-cotton restrictions were removed near the beginning of the year. An effort was undertaken through State regulation of planting dates and cultural methods to reduce the population of pink boll worms to a point where eradication may again be undertaken. The pest was present in all of the older areas of infestation from Midland County, Texas, to eastern Arizona with the exception of the Duncan Valley. See COTTON.

**DATE SCALE ERADICATION.** The cooperative State and Federal eradication work with the date scale in California and Arizona was continued as in 1930, nearly half of the infested palms found in various districts having been dug out and destroyed and the others defoliated and treated.

**OUTBREAK OF GRASSHOPPERS.** The devastating grasshopper outbreak which took place in the Great Plains area was the most serious of any since the early settlers were demoralized by the invasion of the Rocky Mountain locust in the decade following 1870. Serious outbreaks were quite generally reported from New York westward to Idaho, Nevada, and Arizona and southward to Arkansas, Oklahoma, and Texas. The Dakotas and Nebraska appear to have suffered most seriously.

**A NEW TOBACCO PEST.** The destructive moth pest *Ephesia elutella* was discovered in August, 1930, attacking stored leaf tobacco in warehouses in a restricted area in Richmond, Virginia, this having been its first appearance in tobacco. The work of eradication through fumigation was at once commenced and is thought to have resulted in its extermination.

**INSECTICIDES AND INSECT CONTROL.** The activ-

ity in work with insecticides continued. In experiments conducted the powdered root of the American plant known as devil's-shoestring was found to be efficient in the control of a number of insects, especially animal parasites. The addition of a one-half per cent Penetrol to Derrisol increased its efficiency as an arachnicide and commercial control of the red spider in the greenhouse was obtained from two applications, eight days apart. Ethylene oxide which was tested as a substitute for carbon disulphide destroyed both adults and larvæ, of the Japanese beetle and adult Colorado and Japanese bean beetles in two hours at 75° F. when used at the rate of 2 pounds per 1000 cubic feet of room space. The application of paradichlorobenzene dissolved in crude cottonseed oil at the rate of 1 pound to 2 quarts of oil, with a paint brush, was found the most satisfactory control measure for the lesser peach borer. Hydrated ferric oxide when mixed with lead arsenate increased the adhesive properties of the arsenical to apple foliage and prevented arsenical injury.

Investigations in the Pacific northwest showed that the lubricating oil emulsions had several advantages over lime sulphur in combating the San Jose scale and certain other fruit pests. The oil emulsions are more economical than lime sulphur, are easier to apply thoroughly, and are more effective against the eggs of the red spider, tree hoppers, and the fruit leaf roller and against aphids. Experiments in Idaho demonstrated that the dormant oil sprays may be applied safely to apple trees in the spring only before bud scales begin to separate. Oil of 50 to 70 sulphonation and of not less than 100 viscosity test may be safely used for dormant spraying.

PARASITES AND INSECT CONTROL. Much was accomplished in the control work with insect parasites. Two important wasp-like forms of minute size were being produced in great numbers for distribution, a larval parasite of the oriental fruit moth and the cosmopolitan insect egg parasite *Trichogramma minutum*. The introduction of parasites of the sugar cane moth borer from Peru was successfully accomplished in May through the use of air transportation. The egg parasite of the range caterpillar, a pest which ravages the grasslands in the southwestern United States, was artificially reared during the winter and liberated by the millions as a means of control. This egg parasite was similarly reared and released in orchards in many States to combat the fruit worms that cause serious injury to the apple and peach. In Louisiana the field colonization of from 5000 to 6000 egg parasites per acre was effective in preventing from one-third to one-half of the damage to sugar cane caused by the sugar cane moth borer. The eggs of the bagworm were found to be fairly satisfactory as hosts for hibernating egg parasites for periods of time from 40 days to six months at temperatures approximating 40° F. A parasite of the citrus black fly introduced from Malaysia into Cuba now effectively controls the black fly.

INSECT TRANSMISSION OF PLANT DISEASES. The work of the year resulted in a considerable advance in the knowledge of the insect transmission of plant disease. The causative organism of fire blight of deciduous fruits was isolated in Arkansas in the early spring before the development of blight, from beehive material collected and from bees themselves, indicating that this may be a way in which it is carried over and

the manner in which it is spread. Work conducted in Wisconsin indicated that while aphids probably do not disseminate ordinary tobacco mosaic disease, they do play an important part in the dissemination of this disease in tomatoes and from tomato to tobacco where the two crops are grown in close proximity. It was shown conclusively in work in New York that aphids feeding on the sprouts of seed potatoes spread leaf roll very rapidly and widely, provided the aphids are numerous.

In California yellows disease of plants was transmitted by the six-spotted leaf hopper. Non-infected leaf hoppers feeding on infected carrots and parsley plants became infective and transmitted the disease to healthy asters and celery. The disease was then transmitted from infected asters and celery back to carrots and parsley. It was also transmitted from infected carrots to healthy carrots and similarly from parsley to parsley, carrot to parsley and parsley to carrot.

In Hawaii the onion thrips was found to transmit yellowspot of pineapples, the larvæ imbibing the infection and transmitting it after reaching the adult stage. The common wilt disease of the pineapple was discovered to be transmitted by the pineapple mealybug. It was determined that the cabbage maggot may serve as an agent of dissemination and inoculation of the soft rot bacteria of the cabbage, turnip, and other crucifers.

INSECTS, TICKS AND DISEASE. The common American dog tick often referred to as the wood tick was found to be a carrier of the causative organism of tularemia, of the eastern type of Rocky Mountain spotted fever, and also to be capable of transmitting anaplasmosis of cattle, a disease that had in the last few years appeared from coast to coast as far north as Kansas and caused some heavy losses. The transmission of relapsing fever of man in Texas by the tick *Ornithodoros turicata* was demonstrated. It was proved experimentally that the tropical rat mite not only causes a dermatitis of man but that it may transmit endemic typhus, a disease widespread in the United States.

A severe outbreak of the so-called buffalo gnat occurred in portions of Mississippi and Arkansas in the spring and caused a considerable loss of livestock. Much was accomplished in the perfection of methods and technique in securing and maintaining a stock of living blowfly larvæ in adequate numbers to be used in the post-operative treatment of osteomyelitis as developed by the late Dr. William S. Baer of Baltimore (q.v.).

**ERITREA**, *âr-rê-trê'â*. An Italian colony on the African coast of the Red Sea, extending 670 miles from Cape Kasar to Cape Dumeirah on the Strait of Bab-el-Mandeb. Area, 44,795 square miles; population, at the census of 1928, 510,000 natives and about 3650 Europeans, mostly Italians. The seat of government is Asmara, situated 7765 feet above sea level, with a population of 18,500 (3500 Europeans). Massawah is the principal trade centre, with an estimated population of 12,275. The natives are chiefly Coptic Christians and Mohammedans. The culture of coffee, cotton, tobacco, flax, bananas, and agave (a fibre plant) has been successfully introduced. The local trade is almost entirely confined to camels, oxen, sheep, goats, and their products. Imports by sea and land in 1929 were valued at 251,557,962 lire (about \$13,232,000) and exports at 104,910,481 lire (\$5,518,000). The lira equals \$0.0526 at par. The budget for the 1930-31 fiscal year estimated colonial revenue at 58,161,980 lire, the contribution from the Italian government at 26,200,000 lire, civil expenditures at 40,754,730 lire, and military expenditures at 17,456,250 lire. There is a military force of 200 Italian officers and 4000 native troops. Railways in 1930 extended 194 miles and 65 miles of a new line from Agordat to Tessenei had been completed. Much traffic is by camel caravans. Governor in 1931, Riccardo Astuto dei Duchi di Lucchesi.

**ESPERANTO.** See **PHILOLOGY, MODERN.**

**ESSAYS.** See **LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; ITALIAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH LITERATURE; ETC.**

**ESTONIA.** A republic on the eastern shore of the Baltic, bounded by the Gulf of Finland on the north, Union of Soviet Socialist Republics (Russia) on the east, and Latvia on the South. Formerly a part of the Russian Empire, it was declared independent on Feb. 24, 1918, and its independence was recognized by Soviet Russia by the treaty of Feb. 2, 1920. Capital, Tallinn (Reval).

**AREA AND POPULATION.** The total area is about 18,358 square miles and the estimated population in 1930 was 1,117,000 (1,107,059 at the 1922 census), of whom about 87.7 per cent were Estonians, 1.7 per cent Germans (Balts), and 10.6 per cent Russians and other nationalities. The populations of the chief cities at the 1922 census, with 1930 estimates in parentheses, were: Tallinn (Reval), 122,419 (131,429); Tartu (Dorpat), 50,342 (60,933); Narva, 26,912 (25,205); Pärnu, 18,499 (20,885). Births averaged 19,653 annually for the period 1926-30 and deaths, 18,393. Five-sixths of the population are Lutherans.

**EDUCATION.** Elementary education is free and compulsory. In 1929-30 there were 98,714 pupils in primary schools, 15,991 in secondary schools, and (in 1927-28) 9124 in higher and professional schools. There is a university at Tartu (Dorpat). At the 1922 census, 5.6 per cent of the population 10 years of age and over were illiterate.

**PRODUCTION.** Agriculture and dairy farming

are the principal occupations, engaging 70 per cent of the population. In 1930, there were 2,587,000 acres of arable land, about 4,379,000 acres of permanent meadow and pasture, and 2,220,000 acres of forests. Production of the chief crops in 1930, with 1929 figures in parentheses, was: Wheat, 1,635,000 bushels (1,260,000); rye, 8,885,000 bushels (5,737,000); barley, 5,893,000 bushels (5,687,000); oats, 10,870,000 bushels (10,277,000); potatoes, 31,713,000 bushels (27,679,000); flax fibre, 23,744,000 pounds (21,498,000). Livestock in 1930 included 627,000 cattle, 467,000 sheep, 290,000 swine, and 204,000 horses. Textiles, paper, and timber are the chief industries. There were 33,093 workers employed in 757 large and medium sized industrial enterprises at the end of 1930.

**COMMERCE.** Imports for consumption in 1930 were valued at \$20,363,000 (\$32,955,000 in 1929) and exports of Estonian products at \$25,844,000 (\$31,482,000 in 1929). Exports in 1930, in order of value, were butter, lumber, cotton cloth, wood pulp, cotton yarn, wood manufactures, and flax. Imports, in the same order, were raw cotton, rye, sugar, and wheat. Of the total 1930 imports, Germany furnished 28.3 per cent, the United States 12.7 per cent, the Soviet Union 9.3 per cent, and the United Kingdom 8.6 per cent. Exports went to: United Kingdom, 32.3 per cent; Germany, 30.1. Imports in 1931 were \$16,326,400; exports, \$18,952,900 (preliminary).

**FINANCE.** Ordinary returns for the fiscal year ended Mar. 31, 1930, showed revenues of 86,287,000 crowns (\$23,125,000) and expenditures of 83,455,000 crowns (\$22,366,000). As the revenues included a surplus of 4,546,000 crowns carried over from 1928-29, there was a slight deficit in 1929-30. In the budget returns for 1930-31, total receipts and expenditures were placed at 89,752,000 crowns (\$23,954,000) and 96,967,000 crowns (\$25,987,000), respectively; for 1931-32 (estimated), 83,831,000 crowns (\$22,467,000) and 80,614,000 crowns (\$21,604,000), respectively. Expenditures for grain price stabilization in 1930-31 increased the outlay, necessitating a deficiency bill of 7,215,000 crowns. The public debt on Mar. 31, 1930, was equivalent to \$30,005,000, of which \$20,251,000 were borrowed in the United States; all but \$144,000 was held externally. One crown exchanged at \$0.267 in 1930-31.

**COMMUNICATIONS.** The railway, telegraph, and telephone systems are government owned. There were 1175 miles of railway line in operation in 1930, the gross receipts totaling \$4,120,000. Highways in the same year extended 14,424 miles. During 1929, 2496 vessels of 892,057 tons entered the ports, Tallinn (Reval) being the principal calling point. The merchant marine in 1928 included 74 steamers of 38,767 tons.

**GOVERNMENT.** According to the constitution of Dec. 21, 1920, executive power is in the hands of a state head or "State Elder" and a ministry, both chosen by and responsible to the State Assembly; legislative power, in the hands of the State Assembly of 100 members elected for three years on the basis of proportional representation and by direct, universal, and secret suffrage. Provision is made for referendum and legislative initiative. The composition of the State Assembly following the elections of May 11-13, 1929, was as follows: Socialists, 25; Farmers' Union, 24; Settlers, 14; Radicals, 10; Populists, 9; Workers' party, 6; Minority Nationals, 5; Christian

party, 4; and Houseowners, 3. Prime Minister and State Head at the end of 1930, Otto Strandmann (Radical), heading a coalition of the Farmers' Union, and the Christian, People's, Radical, and Settlers' parties.

**HISTORY.** The principal developments in Estonia during 1931 were the collapse of the Strandmann Coalition government on February 3 and the establishment in November of strict government control over approximately 40 per cent of all imports in an effort to check an alarming drain on the country's gold reserve. The fall of the Strandmann Cabinet resulted from a division in Parliament on the Government's proposals for drastic reductions in the 1931-32 expenditure budget. Minister of Agriculture Kerem resigned January 21 because his party (the People's party) refused to support the coalition on the budget issue. It proved impossible to fill the vacancy by a man acceptable to the Farmers' Union, which represented constituencies gravely discontented with the agricultural situation. The Government accordingly resigned. Nine days later (February 12) a new government was formed under Konstantin Päts, with Jaan Tõnisson as Minister of Foreign Affairs. It represented a coalition of the Farmers' Union with the Socialists and other parties.

The Government's bill establishing monopolistic control over 30 leading import commodities was passed by Parliament November 6 and went into effect five days later. It was calculated to redress the adverse balance of trade by further reducing imports and at the same time to check the outflow of gold exchange resulting from the financial crisis in Central Europe and the abandonment of the gold standard by Great Britain. Thereafter permission of the Ministry of Finance was required to import grain, coal, oil, agricultural machinery, automobiles, textiles, and other important commodities. On November 17, the sale, purchase, export, and import of currencies and commercial paper were placed under control of the Government, acting through the Eesti Bank. Finance Minister Pung resigned in protest against these measures, and was replaced by August Jürman (Farmers' Union).

That the Communist Labor party, dissolved by the Government in April, 1930, was carrying on its activities underground was indicated by the announcement on June 9, 1931, that the Estonian secret police had discovered and raided its headquarters. Fifty alleged Communists were arrested and important documents were seized, including alleged plans for a revolt and evidence that the movement was being subsidized to the extent of 60,000 Estonian crowns (about \$16,000) annually from Moscow. Fearful that the voluntary bourgeois militia was preparing for a *coup d'état*, Estonian Socialists were reported to have formed a Red Guard in Reval and a number of other towns. Charges that Minister of Interior Hünerson and the crew of a Coast Guard vessel had cooperated with an Estonian company in the illegal export of liquor were made in Parliament October 15 by Tõnis Kalbus, former Minister of Justice. Conclusion of an economic pact with Latvia was officially announced May 5 (see *LATVIA* under *History*). For a concise review of political developments in Latvia since 1920, consult Malbone W. Graham, "Stability in the Baltic States," *Foreign Policy Reports*, May 27, 1931, vol. vii, no. 6.

**ETHICS.** See *PHILOSOPHY*.

**ETHIOPIA (ABYSSINIA).** A landlocked empire of East Africa, bounded by the Anglo-Egyptian Sudan on the West, Eritrea and French and British Somaliland on the north and northeast, Italian Somaliland on the southeast, and Kenya Colony on the south. Capital, Addis Ababa, with a population of about 65,000. Emperor in 1931, Haile Selassie I.

**AREA AND POPULATION.** With an area of about 400,000 square miles, approximating the combined area of Texas and New Mexico, Ethiopia has a population of approximately 10,000,000. The Abyssinians proper, Christians of Hamitic origin who constitute the ruling race, number less than 3,000,000. The Gallas, comprising two-thirds of the population, Somalis, and Danakil are other important tribes. Besides the capital, Direddawa, with about 40,000 inhabitants, and Harar, with 30,000, are the chief cities. The gradual abolition of domestic slavery was decreed in March, 1924.

**PRODUCTION.** Agriculture and stock raising are the principal industries. The chief export products, in order of importance, are coffee, hides and skins, beans, flour, wax, civet, and ivory. Coffee is cultivated in Harar Province, eastern Ethiopia, but grows wild in the western districts. Grain, cotton, sugar cane, dates, and grapes are grown for local consumption, but all agriculture is exceedingly primitive. Valuable forests and mineral deposits remain largely unexploited due to lack of transportation facilities. The minerals found include iron ore, placer gold, potash, coal, copper, silver, and platinum.

**COMMERCE.** Imports increased sharply after 1924, while exports remained virtually stationary, resulting in a continued adverse balance of trade. The volume of imports in 1930 was estimated at 56,162 metric tons (85,456 metric tons in 1929), while exports amounted to about 33,250 metric tons (28,718 in 1929). Approximately 75 per cent of the total foreign trade passes over the Franco-Ethiopian Railway from Djibuti (French Somaliland) to Addis Ababa. The remaining trade is carried on mainly by caravan across the Sudan and Eritrea frontiers. Cotton piece goods, kerosene, salt, sugar, flour, gasoline, and building materials are the leading imports.

**FINANCE.** There is no budget, no official currency, and but meagre data on public finances. The Maria Theresa silver dollar is the only currency used and its continued depreciation aggravated the economic depression experienced in 1929 and 1930. The Maria Theresa dollar was quoted at \$0.47 in January, 1929, and at \$0.35 in May, 1930.

**COMMUNICATIONS.** The only railway in the country extends 488 miles from the port of Djibuti on the Gulf of Aden to Addis Ababa. Highway mileage in 1930 was estimated at about 2050 miles, of which 50 miles were macadamized streets, 1000 miles were primitive roads, and the remainder caravan tracks. Telegraph and telephone lines link Addis Ababa with the chief cities.

**GOVERNMENT.** The Constitution adopted Oct. 31, 1907, and modified in May, 1919, vested supreme power in a hereditary and absolute monarch. After 1907 the ruler was assisted by a cabinet and, after 1910, by a council of elders. Until 1931, there was no popular representation, the governmental system being essentially that of a feudal monarchy, in which the Coptic Church

played an influential and conservative rôle. Tafari Makonnen, born July 17, 1891, became regent in 1917, and was crowned as King Oct. 7, 1928, and as Emperor Nov. 2, 1930. Upon his coronation as Emperor he assumed the title of Haile Selassie I. Early in 1931, Asfaou Wosan, eldest son of the Emperor, was proclaimed Crown Prince and heir to the throne, the proclamation being ratified by all the feudal chieftains. On July 16, 1931, the Emperor promulgated a new Constitution, establishing a two-chamber parliament with responsible Ministers to carry out its decisions, subject to approval of the Emperor. The members of the Legislature were to be designated by the Provinces, subject to royal consent. The Crown was secured to the ruling dynasty.

A party of American engineers, sent to Lake Tsana in October, 1930, to conduct a reconnaissance survey of the site of a proposed dam at the outlet of the lake and for a connecting road to Addis Ababa, returned to the capital in May, 1931, having completed their work. Their report was to be submitted early in 1932, but financial conditions in the Anglo-Egyptian Sudan were not considered favorable to immediate conclusion of a contract for the purchase of water from the Ethiopian government. Consequently there was no prospect of an early commencement of actual work on the project pending improvement of conditions in the Sudan. See EXPLORATION.

**ETHNOGRAPHY, ETHNOLOGY.** See ANTHROPOLOGY; EXPLORATION.

**EUGENICS.** See ZOOLOGY.

**EUROPEAN FEDERAL UNION.** See UNITED STATES OF EUROPE; INTERPARLIAMENTARY UNION; INTERNATIONALISM; LEAGUE OF NATIONS.

**EVANGELICAL CHURCH.** A denomination formed by the union of the Evangelical Association and the United Evangelical Church. The former was the outgrowth of a movement started in 1800 by the followers of Jacob Albright for the religious and spiritual awakening of the German communities in Pennsylvania. In 1892 a number of ministers and members organized themselves into a separate denomination, known as the United Evangelical Church. At length the growing conviction that the two churches should be reunited led to the appointment of commissions which drew up the so-called enabling act. The new organization was officially established in Detroit, Mich., in 1922.

In 1931 the denomination had 23 conferences in the United States, 2 in Canada, 1 in Japan, 2 in Germany, and 1 in Switzerland. There was a total membership of 262,547, of whom 225,369 were in the United States and Canada; 2469 churches, of which 2128 were in the United States and Canada; 2020 itinerant preachers and 411 local preachers. Sunday schools numbered 2773, with a total enrollment of 465,730. The Christian Endeavor Society membership was 49,171. There were also 1190 local societies, with a membership of 39,577, of the woman's missionary society, which works under the general direction of the board of missions. The total value of all church property was \$38,965,388, while the amount of money raised during the year was \$7,088,769.

The chief schools of the denomination are: North Central College and the Evangelical Theological Seminary in Naperville, Ill.; Western Union College in Le Mars, Iowa; Albright Col-

lege and the School of Theology in Reading, Pa. The denomination also maintains two orphanages and five old people's homes in the United States, as well as several hospitals. Official periodicals are the *Evangelical Messenger* and *Christliche Botschafter*, published in Cleveland, Ohio. A quadrennial general conference was held in Milwaukee, Wis., in October, 1930. All questions of law in the interval between general conference sessions are decided by the board of bishops, which in 1931 consisted of Bishops L. H. Seager, M. T. Maze, J. F. Dunlap, J. S. Stamm, G. E. Epp, and S. J. Umbreit. Headquarters are at the Evangelical Press, 1900 Superior Avenue, Cleveland, Ohio, and in Harrisburg, Pa.

**EVANGELICAL SYNOD OF NORTH AMERICA.** THE. A religious communion strictly evangelical in principle as historically crystallized from the Reformation of the sixteenth century and as embodied in the Reformed and Lutheran doctrinal statements, accepting these statements as far as they agree. When they disagree the Evangelical Synod adheres to the pertinent passages of Holy Scripture and avails itself of the liberty of conscience prevailing in the Evangelical Church. The communion was founded in 1840 at Gravois Settlement, Mo., and was consolidated in 1877 with similar communions. It is organized into 19 districts and has a synodical administration, with legislative powers vested in the biennial district conferences and the quadrennial general conference; the congregations are self-governing in strictly local affairs.

The Evangelical Synod of North America, in 1930, had 1260 congregations, 1165 pastors, and 255,337 individual members, also 1300 Sunday schools with an enrollment of 195,617. Money raised by the congregations for all purposes amounted to \$6,308,322, while the total value of church property was \$43,023,856. Missionary work was carried on in the United States, India, and Honduras. The home mission board, which reported a total income of \$116,250, employed 111 pastors in 133 fields in the United States. The foreign mission board, which reported a total income of \$174,446, employed 38 missionaries and 345 native helpers in India and 12 missionaries in Honduras.

The denomination supports three educational institutions: Eden Theological Seminary in Webster Groves, Mo.; Elmhurst College in Elmhurst, Ill.; and Oakwood Institute, Cincinatti, Ohio. It also publishes the following periodicals: *The Evangelical Herald*; *The Tidings*; *The Light Bearer*; and *Der Friedensbote*. The Rev. C. W. Locher, D.D., is president. Headquarters of the synodical administration and of the administrative boards are located at the Evangelical Synod Building, 1720 Chouteau Ave., St. Louis, Mo.

**EVOLUTION.** See BOTANY; ZOOLOGY.

**EWING, ROBERT.** An American publisher, died in New Orleans, La., Apr. 27, 1931. He was born in Mobile, Ala., Sept. 27, 1859. In 1887 he became associated with the New Orleans *Daily States* as telegraph editor, becoming assistant business manager in 1893, business manager in 1898, and publisher and owner in 1900. He had also published the Shreveport *Times* since 1908 and the Monroe *News-Star* since 1930, and had established the Monroe *Morning World* in 1929. He was an exponent of personal journalism, as opposed to control by manufacturing or other syndicates, and had wielded a powerful influence in State and national politics from 1898, when

he was a member of the Louisiana Constitutional Convention, until 1928 when he was chairman of the Louisiana delegation at the Democratic National Convention in Houston, Texas. He was also Louisiana member of the Democratic National Committee from 1908 to 1919. He was active in the Associated Press and the Southern Newspaper Publishers Association, being president of the latter during 1927-28 and chairman of the board in 1929.

**EXCAVATIONS, CLASSICAL.** See **ARCHÆOLOGY.**

**EXCHANGE, FOREIGN.** See **FINANCIAL REVIEW.**

**EXHIBITIONS.** See **ART EXHIBITIONS.**

**EXPERIMENT STATIONS.** See **AGRICULTURAL EXPERIMENT STATIONS.**

**EXPLORATION.** Economic and political conditions during 1931 served to postpone a number of expeditions. Yet the boundaries of geographic knowledge were notably extended by the explorations of adventurers and scientists. Expeditions to the Arctic and Antarctic regions are discussed under **POLAR RESEARCH**, while anthropological and archaeological investigations are described under their separate headings.

The outstanding development of the year, ranking with the great explorations of history, was the crossing of the Ruba-el-Khali, or the Great Southern Desert of Arabia, by Bertram Thomas, an English Orientalist and former Wazir and Finance Minister to the Sultan of Muscat. It was the first time in history that this desert wilderness of some 300,000 square miles had been crossed by a white man. Starting from Dhofar on the southern coast of Arabia, in December, 1930, Mr. Thomas traveled north by camel some 900 miles to Dohah on the Persian Gulf, arriving there on Feb. 21, 1931. By laying his plans in secret, his caravan managed to get through without arousing the tribes of the interior, whose hostility to strangers had kept the Ruba-el-Khali one of the largest blank spots on the globe. He started with 30 Arabs and 40 camels, but reduced his party to a mere handful for the last and hardest stages of the march. One hundred miles from the coast Mr. Thomas crossed a 1000-foot plateau, whose shifting sands were rumored to conceal the ancient city of Urbar. He found evidence of an ancient commerce in this region in caravan tracks, deeply cut in the steppe. Singing sands, an inland salt water lake about seven miles long, a fairly abundant animal life, and nomads subsisting almost entirely upon camels' milk were other discoveries.

**NORTH AMERICA.** During July and August, a party headed by Dr. J. N. Henry, of Philadelphia, explored the so-called "tropical valley" of Northern British Columbia. Located in the mountains near the junction of the Racing and Toad Rivers, 400 miles northwest of Fort St. John, the valley proved to be three-fourths of a mile in length and honeycombed with hot springs. Valuable botanical specimens were collected. In the Bridge River district of British Columbia, an ice field covering about 350 square miles and providing the source of the Bridge, Whitewater, Southgate, Squamish, and Lilloet Rivers, was discovered by Major F. V. Longstaff. Father Bernard R. Hubbard, Jesuit priest, explored on foot and by airplane the Aniukchak volcano in the centre of the Alaskan peninsula, following one of the greatest eruptions of modern times, which occurred there in May, 1931. A Canadian government air survey

was made of 2000 miles of coast along King William Island and the Adelaide Peninsula, in the Northwest Territories. Dr. W. S. Ladd and two companions in June made the first ascent of Mount Fairweather, a 15,292-foot Alaskan peak, and during the same month Miss Milina Jank, of Munich, Germany, with three male companions, made the first ascent of Mount Baker from the north side. The 1931 expedition of the Oxford University Exploration Club consisted of a scientific investigation of the interior of Akpatok Island in Ungava Bay, Northern Labrador. The party was headed by H. M. Clutterbuck.

**SOUTH AMERICA.** Exploration parties in various parts of South America were unusually numerous. The Shippee-Johnson expedition, sponsored by the American Geographical Society, mapped and photographed from the air little known regions of Southern Peru, discovering a great wall built for the defense of a former civilization and 15 extinct villages in the Calca Valley. The Venezuela-Brazil border region was explored and partly mapped by a National Geographic Society expedition under Ernest G. Holt, who returned with numerous plant and animal specimens. Dr. Herbert Spencer Dickey returned once more to the Orinoco with an expedition and was successful in locating the source of the great river. He reported that his observations, if confirmed, would change the boundary between Brazil and Venezuela as shown on existing maps. The Matto Grosso region of Brazil was explored by a large expedition sponsored by E. R. Fenimore Johnson and led by Capt. Vladimir Perfilieff. Photographs and sound-films were made of Indian and animal life. Another motion-picture and scientific expedition, led by Major Leslie G. Barbrook, was working in the Andes of Ecuador and Colombia at the end of the year. Dr. Parke H. Struthers, leading a Syracuse Andean expedition, explored the mountainous region in the interior of Venezuela and returned with live animals and birds for the Syracuse zoological park. Aerial photographic surveys were made of coastal areas in South and Central America and Porto Rico by Lieut. Carleton McGauley and an American party with three planes. Count Edmondo di Robilant, of Italy, crashed in the jungle along the Parana River while surveying an air route from São Paulo, Brazil, to Bolivia. He was rescued by a river steamer after 18 days. The Chilean Ministry of South Territories early in January sent a party of nine men to explore the little-known Aysen Territory, between Puyuhuapi and Lake Rosselot. The party lost its boats in the rapids of the Bordali River when within sight of Lake Rosselot and was forced to return.

**ASIA.** The most ambitious exploration of Asia during the year was that conducted by a large French motor expedition under Gorges-Marie Haardt, with which the National Geographic Society coöperated. Utilizing specially constructed tractor-type cars, the party started from Beirut, Syria, on Apr. 4, 1931, to follow Marco Polo's ancient route to the east. Traversing Syria, Iraq, Persia, and Afghanistan, the motor caravan entered India and penetrated the Himalayas to the village of Gilgit. There the party was forced to abandon the automobiles and to cross the Himalayas by ponies. At Urumchi, Sinkiang Province of China, on October 26, the party united with another unit, which had traveled westward from Peiping in motor cars built for

desert conditions. Returning to Peiping, the expedition planned in 1932 to return to Europe via Indo-China, Siam, India, Persia, and Arabia.

An aerial survey of a large part of Eastern Turkestan was planned by a British expedition under Lieut.-Col. J. E. S. Stewart, which left London in March, 1931. The expedition was to spend 18 months in western Sinkiang, with Yarkand as a base. Its object was to inspect the possibilities for better transport facilities eastward from Sinkiang, to create a channel for trade through India, and to discover areas for profitable development. Sir Aurel Stein and Dr. Sven Hedin continued their researches in Chinese Turkestan. The former was forced to discontinue his work by Chinese officials, after he had circled and mapped the great Tarim basin, site of an ancient inland sea. Dr. Hedin turned over to Chinese assistants four meteorological stations in Kansu and Sinkiang. Dr. Folke Bergman, an archaeologist working in the same area, reported important discoveries near the site of Edsain Gol, a city visited by Marco Polo.

Two mountain climbing expeditions visited the Himalayas. A British group led by Frank S. Smythe reached the summit of Mount Kamet on June 21, conquering the highest peak yet climbed by man (25,447 feet). A German expedition under Dr. Paul Bauer made an unsuccessful assault on Mount Kanchenjunga (28,146 feet), which in 1930 had repulsed an international group of climbers. After ascending to within 2156 feet of the top, the Germans were turned back by a wall of ice unassailable because of danger from avalanches. One member, Herr Schaller, was killed by fall during the climb.

Siberia was a field of investigation for various Soviet exploring and scientific expeditions during the year. The Proletarian Tourist Society sent an expedition to the Altai Mountains in northwestern Siberia and another to the Tien-Shan Mountains in western Siberia. Both parties carried on mapping and surveying work and prospected for gold and other minerals. A third expedition organized by the Academy of Sciences and the Proletarian Tourist Society under N. B. Krylenko, Assistant Commissar for Justice of the Russian Socialist Federated Soviet Republic, explored the high Pamirs to the northwest of the Pamir plateau. Geologists, cartographers, and prospectors worked with the expedition. Numerous other scientific parties reported valuable mineral discoveries in various parts of the Soviet Union. During the year an Academy of Science expedition returned to Leningrad, after spending three years among the descendants of early Cossack colonists living on the delta of the Indigirka River in northeastern Siberia. Isolated from the world for centuries and visited by no one during the previous 18 years, the "Russkoe Uste," as they were called, spoke a broken Russian with many old Russian terms, and preserved the customs and dress carried to the Siberian Arctic by their colonist forbears. The expedition covered 5000 miles by dog and reindeer-sled during its exploration of the Indigirka. It required five months to make the return trip of over 6000 miles to Leningrad.

**AFRICA.** In Africa, the year was marked by the discovery and mapping of a new lake in Ethiopia by American engineers engaged in a reconnaissance survey of the proposed Lake Tsana dam. The lake, named Lake Southard in honor of the American Minister to Addis Ababa, lay

9000 feet above sea level in the crater of an extinct volcano. An ancient manganese mine, the first of its kind known to science, was discovered by an Italian party under Commander Gatti during an archaeological study of the Broken Hill district of Northern Rhodesia. Three Italian aviators—Lombarde, Mazotti, and Rossini—circumnavigated the continent by air, a French expedition crossing the continent from Dakar to Djibouti continued its study of native peoples, and Mr. and Mrs. Martin Johnson returned to the United States after further explorations and photographic work in the Belgian Congo, Uganda, and Kenya. An extremely small cannibalistic pigmy tribe was found in the Belgian Congo by Herbert Bradley of the Bradley-Bigelow Expedition. An expedition headed by Sir William Simpson of the Royal Society of Tropical Research and including Dr. Arthur Torrance of Los Angeles, reported the discovery of a new tribe living in underground villages in the remote interior of the Southern Sahara.

**AUSTRALIA.** About 40,000 square miles of little-known territory in Central Australia was mapped from the air during the year by the McKay Aerial Survey Expedition. Stony mountains of great size and of queer formation were shown on the map, which was presented to the Commonwealth government. The largest scientific party ever sent into Central Australia was organized by Adelaide University to study the habits of the aborigines. The party also investigated meteorite craters along the Fink River, discovered earlier in the year by two geologists, Messrs. Alderman and Winzor. The craters ranged from 220 to 10 yards wide and the largest was 50 feet deep. A Harvard University expedition under Prof. W. M. Wheeler was at work in isolated areas of Australia and Tasmania, collecting rare animals; it planned to remain in the field until July, 1932.

**OTHER AREAS.** The South Sandwich Islands, Bouvet Island, the South Shetlands, the South Orkneys, and other of the Falkland Island Dependencies were surveyed during the year by the British Royal Research ship *Discovery II*. The geography and wild life of the mountains of the island of Dominica in the British West Indies were described by Dr. Paul G. Howes of the Bruce Museum of Greenwich, Conn., in a publication setting forth the results of two expeditions.

See **ANTHROPOLOGY**; **POLAR RESEARCH**; **GEOGRAPHIC SOCIETY, NATIONAL**; and **GEOGRAPHICAL SOCIETY, AMERICAN**.

**EXPOSITIONS.** The great exposition of the year was the one mentioned under **EXPOSITIONS** (YEAR BOOK, 1930, p. 255) with the subtitle *Paris. International Colonial and Overseas Exposition*. This important exposition had for its purpose the exhibition in one small area of a living cross-section of all the colonies of France, and also of the colonies of other exhibiting nations. According to Marshal Lyautey, the commissioner general: "This exposition will enable all civilized countries to compare their methods one with the other in order that those recognized as most effective may be improved and expanded both in a social and economic way."

The site selected was in the Bois de Vincennes, near and to the east of Paris, beautiful with rolling lawns, lakes, and tree-clad hills, containing 250 acres, and easily reached from the centre of the metropolis by a new subway or busses and

tram lines to Vincennes, and these connecting with a railway that made the entire circuit of the grounds, rendering it possible to visit easily the leading objects of attraction.

The general plan of the Exposition was divided or grouped in three major sections as follows: 1, General section, 2, Colonial Sections, and 3, Foreign Sections.

The General Section included a permanent Museum of Colonies built of stone and which at the close of the exposition became a colonial Museum. On the front façade of this building was carved in white Anjou stone in a style evolved from ancient Assyrian and Egyptian art, the story of life from its beginning and culminating in the development of its modern commercial aspects. Here will be gathered and preserved the valuable collections of native arts and industries which will long serve to remind its visitors of the glory and wealth of the French Colonial possessions in 1931. Also in this section was the International City of Information, a large building containing a hall for furnishing general information, the offices of the various nationalities equipped with means for distributing descriptive matter to inquirers, and finally one assembly hall for conferences, lectures, the presentations of films, etc., and also where the international congresses were held. Finally there were the Metropolitan sections in which were grouped all the French industries that export to the colonies. These industries were subdivided into four sections which included something like 31 groups and 62 series.

The Colonial Sections contained the exhibits from the French Colonies, which were shown in buildings aligned for the most part along the Grand Avenue des Colonies and included representations from Algeria; Cameroon and Togo; French West Africa; Guadeloupe, Réunion and Martinique; Madagascar; Morocco; Somali; Syria and Laban; Tahiti; Tunis, and other minor possessions. They were housed in special buildings erected by the respective colonies and were painstaking reproductions, of original structures. These included the Mosque of Djenné (French Western Africa); the famous temple of Angkor-Vat (Indo-China); the Royal Palace of the Hova dynasty (Madagascar), and one of the palaces of Marrakech (Morocco.) They were distinctly characteristic of the peoples they represented—bizarre, colorful, and unusual—and were well worthy of careful study.

The exhibits of the colonial possessions of Belgium, Denmark, Holland, Italy, Portugal, and the United States were shown in special buildings erected by their respective governments. That of the United States was a copy of Mount Vernon, the home of George Washington. All the rooms on the first and second floors at Mount Vernon were reproduced as they were in the eighteenth century. There was the central hall with the main staircase, the west parlor, Miss Custis's music room, the family dining room, the banquet hall, Washington's room, Mrs. Washington's sitting room, the library, and Lafayette's room. Historically, the reproduction of Lafayette's room, on the second floor, was of special interest to the French. The rug in the west parlor at Mount Vernon, woven by order of Louis XVI and sent by him as a present to Washington, was produced in stencil pattern. The bronze key to the Bastille, which after the French Revolution found its way to Mount Ver-

non as a present from Lafayette, was also duplicated. It was included with other furnishings of particular French interest, especially a chair presented to Martha Washington by Lafayette, the original of which was in Mrs. Washington's sitting room in the old mansion. At the close of the Exposition the American building was presented to the French government. The exhibits of the United States came from the territories of Alaska, Hawaii, the Philippine Islands, Samoa, and the Virgin Islands.

The amusement features were not over conspicuous but included spectacular illuminated water effects, weird in their conception and brilliant in their execution. The native exhibitions of colonial every-day life were of remarkable beauty. The shops with their strange local wares and the brilliant costumes from overseas were fascinating in their interest. A collection of native animals, forming a sort of zoological exhibit at the southeast end of the grounds, attracted much attention.

This great Colonial Exposition, the product of 10 years' planning, was formally opened on May 6, when amid the gleaming sabres of an escort of 100 Moroccan horsemen, Marshal Lyautey, France's outstanding colonial proconsul, conducted President Doumergue from the Elysée Palace to the exposition grounds, just outside the gates in Vincennes. Ambassador Walter E. Edge attended the ceremonies with members of the diplomatic corps. The reproduction of Mount Vernon was formally inaugurated on May 16 with addresses by Ambassador Edge and Marshal Lyautey.

The Exposition was brought to a close with a series of gala performances of a most brilliant character, rich with oriental splendor. The remarkable exhibits of unusual products and the presentation of unique attractions of native peoples proved so fascinating that the attendance was unexpectedly great (much greater than had been anticipated) and the financial returns far exceeded the hopes of the management. It was a great success. It was proposed to extend the life of the Exposition but the temporary character of many of the buildings, some of which had already begun to deteriorate, as well as the fear that the natives would find winter weather difficult to stand, led the authorities to decide against its continuance. See ARCHITECTURE under *France*.

CHICAGO EXPOSITION. A press statement issued on November 1 by the exposition authorities announced that so well advanced were the preparations for Chicago's Century of Progress Exposition, scheduled to open in June, 1933, that the project could be completed in 1932, if necessary. Five structures at the end of 1931 were completed or were under construction, and \$10,000,000 in bonds sold, insuring ample financial backing. Contracts for exhibition space had been received in such number as to threaten the ultimate capacity. Forty-two States and twenty foreign nations had indicated their desire to send exhibits. The States were to exhibit in a single Hall of States, adjoining the Federal building, and the foreign countries in a different section. General Manager Lohr declared that the management was not depending on the sale of the exhibition space to finance the venture. Of the \$10,000,000 bond issue only about \$3,000,000 had been expended to the end of 1931. Ten per cent of the issue had been called as needed. Seven

calls, varying between \$500,000 and \$750,000, had been made. In October work was begun on the electrical buildings group on Northerly Island, on which is the Adler planetarium. The cost was estimated at \$750,000. This group, like most of the other buildings, was to be of modern architecture. The unit was to be 1200 feet long and 300 feet wide, and for a considerable portion was to be two stories high. One section was to be devoted to radio, the second to telephone and telegraph, and the third to power generation, distribution, and utilization. The power section was to be in the form of a huge G facing west, it would rise from a series of terraces and surround a landscaped court, back of which would run a hall 500 feet long and 60 feet high. An electric cascade will play on the upper terrace. The radio and communication sections will form an E-shaped structure facing the lake. The entire unit will be embellished with hanging gardens and fountains. When the exposition opens the South Park system, much of which had been reclaimed from Lake Michigan, was expected to be a continuous succession of palaces, plazas, esplanades, and driveways from Grant Park to the University of Chicago in the Jackson and Washington Park section.

No world's fair in history had been so far advanced in its preparation nineteen months before its opening date, according to Mr. Dawes. Expenditures of private corporations for exhibits and private exhibit halls would raise the total cost of the exposition to \$50,000,000.

**CUBA.** A plan for an International Exposition to be held in Havana from Dec. 20, 1931, to Apr. 15, 1932, as a preliminary step in the holding of a Universal Exposition during the years 1932 and 1933 was proposed by a French Syndicate. It was suggested that the exposition grounds be on the reclaimed land at the foot of the Prado and extending along the harbor following the same lines of the Colonial Exposition in Paris. The grounds would also contain a cabaret, a Parisian restaurant, and an amusement park. Eight nations proposed to participate in the Universal Exposition.

**RIO DE JANEIRO** was preparing for an international fair to be held on the same grounds used for the 1925 exhibition. Although it was to be international, the fair expected to display mostly national goods. The buildings were being reconditioned for this purpose.

**TEXAS.** It was proposed to hold a centennial exposition in Texas in 1936, to commemorate the hundred years of independence from Mexico and to call attention to the industrial and agricultural rank of the State. An exposition to surpass the Chicago Fair in 1933 is suggested. Cities and towns of Texas are to be asked to levy a tax to support the exposition and Congress will be petitioned to grant Federal aid. It is estimated that from \$15,000,000 to \$25,000,000 will be needed.

**TRADE FAIRS: Leipzig.** As usual the spring fair of 1931 was held in Leipzig, Germany, during March 1-7. Foreign buyers showed willingness to buy only at the lowest conceivable price. It was generally believed that the fair served chiefly to accelerate the delayed fall in manufacturers' prices in accord with lower wages and lower costs of raw materials. The demand centered on medium priced products, not on lowest quality goods, and on novelties. The buyers believed novelties would get a more rapid turnover

and were eager to borrow working capital on as short terms as possible. About 95 per cent of 1772 important companies in all parts of Europe which exhibited in the Spring Trade Fair believed that abolition of all tariff barriers would materially benefit their own businesses. This large figure was obtained from a questionnaire sent out by the Institut für Konjunkturforschung, working in conjunction with the permanent office of the fair in an effort to derive a cross-section of opinion of the European business community.

The autumnal fair was held during August 30 to September 4. Notwithstanding the world's economic crisis never was competition to obtain business keener, for with a winter of many unemployed ahead and many industrial firms in difficulties the need for orders was urgent. A fortunate circumstance was that many dealers at the spring fair put off buying to see how the economic condition would tend, and their stocks accordingly were depleted. It may be said that business exceeded expectations, which somewhat offset the effects of the existing depression. The usual home demand bulked above foreign buying, and the domestic purchases reflected the continuing tendency of consumers to convert cash into goods. The Leipzig press alluded to the dearth of American buyers. A moderate price decline was noted at the autumn fair in comparison with the spring fair in March. The decline for textiles averaged 10 to 15 per cent, with a drop amounting to 20 per cent or more for certain items.

**FAILURES.** See BANKS AND BANKING; BUSINESS REVIEW; FINANCIAL REVIEW.

**FAIRS.** See EXPOSITIONS.

**FALKLAND, fôk'lând, ISLANDS.** A British crown colony in the South Atlantic 300 miles east of the Strait of Magellan, consisting of: East Falkland, 2580 square miles; West Falkland, 2038 square miles; including in each case various adjacent small islands, about 100 in number. In addition to these are South Georgia, with an estimated area of 1000 square miles, and other dependencies, including the South Shetlands, the South Orkneys, the Sandwich group, and Graham Land, together with all unknown seas and lands of the Antarctic Ocean extending as far as the South Pole. Title to the Falkland Islands also is claimed by Argentina. The estimated population in 1929 was 2375 (1041 females). Stanley, the capital and chief city, had 1000 inhabitants in 1929. Sheep raising, whaling, and seal hunting are the chief occupations. A total of 613,052 sheep were pastured on about 2,248,000 acres in 1929. In the same year 1,047,142 barrels of whale oil were exported and sealing operations yielded 9224 barrels of oil. Exports (1929) were valued at £5,433,579; imports, £787,894; revenue, £196,413; expenditure, £98,426. There is no public debt. Arnold W. Hodson was succeeded as Governor in 1931 by Sir James O'Grady, former Governor of Tasmania.

**FALLIÈRES, fâ'lyâr', CLEMENT ARMAND.** A French statesman and eighth president of the French Republic, died June 21, 1931, in Mézin, Lot-et-Garonne, where he was born Nov. 6, 1841. On completing his law studies in Paris he practiced for several years in Nérac, where he also acted as mayor and as councilor-general of the department of Lot-et-Garonne in 1871. In 1876

he was elected to the Chamber of Deputies, sitting with the Republican Left. After serving as Under Secretary in the Ministry of the Interior during 1880-82, he held that portfolio in the cabinet of Duclerc, which fell in 1883 on account of the Premier's disapproval of the policy of expelling the royalist pretenders to the throne. Fallières became Premier in February, 1883, but resigned less than a month later through a similar defeat in the Senate over the royalist question. Subsequently he was Minister of Public Instruction under Ferry (1883-85), of the Interior under Rouvier (1887), of Justice and Public Instruction under Tirard (1887-88, 1889), and of Justice again under Freycinet (1890-92). In 1890 he was elected to the Senate, and in 1899 became president of that body, being re-elected eight successive times.

In 1906 Fallières was the successful candidate of the Radical Republican and Socialist "bloc" for President of the Republic. On assuming office on February 18 he indicated his policy by grouping in the same ministry Poincaré, Moderate (*Finance*); Savrien, Radical (*Justice*); Clémenceau, Socialist Radical (*Interior*); and Briand, Socialist (*Public Instruction*), thus displaying a tendency towards the Left and a desire to give greater recognition to the working classes. In 1909 a separate Ministry of Labor was formed to which a Socialist was appointed. His administration was marked by the consolidation of relations with the future Allies of France by such agreements as the Anglo-French-Italian treaty maintaining the *status quo* in Ethiopia (1906) and the Anglo-French-Spanish treaty of mutual guarantee in the Mediterranean (1907), and by the Franco-German accord, following the Agadir crisis in southern Morocco in 1911, which confirmed the French right to establish a protectorate in that country. He was succeeded in the presidency in 1913 by Raymond Poincaré.

**FAROE ISLANDS, fār'ō; fār'ō.** A group of 21 islands belonging to Denmark and lying midway between the Shetlands and Iceland. Area, 540 square miles; population in 1930, 24,200. The capital is Thorshaven, with 2896 inhabitants. Sheep farming and fishing are the main occupations. Administration is under a prefect named

by the Danish King. There is a local parliament (Lagting) of 23 elected members, which elects one representative to the Danish Landsting (upper chamber). The people elect one deputy to the Danish Folketing (lower chamber). An autonomist movement has been gaining ground in recent years. The Faroe Lagting elected in 1927 included 10 autonomists, 10 unionists, and 2 Social Democrats. Prefect in 1931, H. Ringberg. See DENMARK.

**FASCISM.** See GERMANY, ITALY, FRANCE, AUSTRIA, and FINLAND under *History*.

**FAULKNER, fak'nēr, JOHN ALFRED.** An American theologian, died in Madison, N. J., Sept. 6, 1931. He was born in Grand Pré, N. S., Canada, July 14, 1857, and was graduated from Acadia College in 1878 and from Drew Theological Seminary in 1881, studying later at the Andover Theological Seminary and the universities of Leipzig and Bonn. Ordained to the ministry of the Methodist Episcopal Church in 1883, he held several pastorates in Pennsylvania, and at Binghamton, N. Y., and in 1897 became professor of church history at Drew Seminary. He was also Stone lecturer at the Princeton Theological Seminary in 1923. His works include *The Methodists* (in the *Story of the Churches* series, 1903); *Cyprian, the Churchman* (1906); *Erasmus, the Scholar* (1908); *Crisis in the Early Church* (1912); *Wesley as Sociologist, Theologian, Churchman* (1918); *Value of Study of Church History* (1920); *Modernism and the Christian Faith* (1921); *Miraculous Birth of Our Lord* (1924); and *Burning Questions in Historic Christianity* (1930). He also contributed to Hurst's *History of the Christian Church* (1897-1900) and to the NEW INTERNATIONAL ENCYCLOPEDIA.

**FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.** An organization established in 1908 by 28 Protestant denominations to act for them in matters of common interest. At the end of 1931 it included most of the major Protestant denominations of the United States, as follows: Northern Baptist Convention; National Baptist Convention; Free Baptists; Seventh-Day Baptists; General Convention of the Christian Church; Churches of God in North America (General Eldership); Congregational Churches; Disciples of Christ; Evangelical Church; Evangelical Synod of North America; Friends; Methodist Episcopal Church; Methodist Episcopal Church, South; African Methodist Episcopal Church; African Methodist Episcopal Zion Church; Colored Methodist Episcopal Church in America; Methodist Protestant Church; Moravian Church; Presbyterian Church in the United States of America; Protestant Episcopal Church; Reformed Church in America; Reformed Church in the United States; Reformed Episcopal Church; United Brethren in Christ; United Presbyterian Church of North America; United Lutheran Church in America. Of these, all were full and official members with the exception of the United Lutheran Church, whose relationship was consultative, and the Protestant Episcopal Church, whose national council co-operates in certain specified areas of work.

The total number of local churches included in the constituency of the Federal Council, according to the *Handbook of the Churches*, 1931, was 110,650; clergymen numbered 135,605, and the total communicant membership, 22,385,695.

The council, made up of members designated

by the several denominations to act for them, meets quadrennially, the last meeting having been held in Rochester, N. Y., in 1928. It has an executive committee, of about 100, meeting annually. An administrative committee, including one or more official representatives from each of the denominations, meets monthly in New York City. This committee includes cooperative agencies carrying on specialized work for the churches, among them being the Home Missions Council, the Council of Women for Home Missions, the Council of Church Boards of Education, the American Bible Society, the Student Volunteer Movement for Foreign Missions, and the International Council of Religious Education. The council also serves as a connecting link between the churches and great social agencies, such as the American Red Cross, child welfare organizations, and the U. S. Bureau of Public Health.

Special tasks of the council are carried on by a group of commissions. The commission on evangelism develops a united approach to the evangelistic work of the churches. The commission on the church and social service is the centre through which the churches deal unitedly with social issues, giving particular attention to the developing of better relations in industry. During 1931 it carried on an educational campaign in the field of Christian family life, including a study of birth control. The department of research and education issues a weekly information service bulletin in which contemporary social questions are discussed from the standpoint of Christianity; it also makes special studies from time to time, the outstanding one in 1931 being an inquiry into the public relations of the motion picture industry.

The commission on church and race relations furthers efforts of the churches in promoting coöperation and good will between the white and colored peoples in the United States. The commission on international justice and good will endeavors to mobilize the Christian forces to abolish war by building up effective international agencies for coöperation, devoting its attention during 1931 especially to the development of a project for good will between children of the United States and of the Philippine Islands, to the promotion of the reduction of armaments, and to support of American membership in the Permanent Court of International Justice. Other commissions of the council deal with Christian education, relations with religious bodies in Europe, religious work in the Canal Zone, army and navy chaplains, and relations with the Eastern churches.

In part, the programme of the council in carried on with funds contributed by individuals interested in the work and in part by appropriations from the various denominations. The official organ is the *Federal Council Bulletin*, issued monthly and furnishing general religious news. The council also sponsors a series of religious radio programmes, broadcast over a nation-wide hook-up of stations and including three Sunday afternoon addresses and a daily period of morning worship.

The officers of the council in 1930 were: President, the Rev. Francis J. McConnell, Methodist Episcopal bishop of the New York City area; chairman of the executive committee, the Rev. George W. Richards, president of the Theological Seminary of the Reformed Church in the United States, Lancaster, Pa.; chairman of the

administrative committee, the Rev. Luther A. Weigle, dean of the Yale Divinity School; chairman of the Washington committee, the Rev. William F. McDowell, Methodist Episcopal bishop of the Washington area; and chairman of the Western committee, the Rev. Herbert L. Willett. National offices are at 105 East Twenty-second Street, New York City, the general secretary being the Rev. Samuel McCrea Cavert. Offices also are maintained in the Woodward Building, Washington, and at 77 West Washington Street, Chicago.

**FEDERAL PRISONS.** See CRIME.

**FEDERAL RECEIPTS AND EXPENDITURES.** See PUBLIC FINANCE.

**FEDERAL RESERVE BANKS.** See BANKS AND BANKING; FINANCIAL REVIEW.

**FEDERAL TERRITORY.** An area of 940 square miles within the State of New South Wales, set aside in 1909 as the site of a Federal capital for the Australian Commonwealth. Estimated population Jan. 1, 1931, 8541, of whom about 6900 resided in the new capital city, Canberra. The Federal Government was moved to Canberra in 1927. See AUSTRALIA.

**FEDERATED MALAY STATES.** A group of Malay states under the protection of Great Britain, constituting a large part of the Malay Peninsula. They comprise:

State	Capital	Area	Population (1921)
Perak . . . . .	Taiping . . . . .	7,875	599,055
Selangor . . . . .	Kuala Lumpur . . . . .	3,195	401,009
Negri Sembilan . . . . .	Seremban . . . . .	2,573	178,762
Pahang . . . . .	Pekan . . . . .	14,006	140,064
Total . . . . .		27,649	1,324,890

The 1921 population included 510,821 Malays, 494,548 Chinese, 305,219 natives of India, 5086 Europeans, and 3204 Eurasians. The 1931 census population totaled 1,651,573. The principal cities are Kuala Lumpur, with 80,424 inhabitants in 1921, and Ipoh, with 36,806. Port Swettenham is the principal port. In 1929, there was a total of 1475 schools, with an attendance of 79,110.

**PRODUCTION.** Tin mining and the growing of rubber are the chief industries. The leading agricultural products are rice, coconuts, rubber, sugar, tapioca, pepper, gambier (a wood extract used in tanning and dyeing), and nipa palms. The forests produce resins, canes, and gutta-percha. Gold and coal are mined extensively; lead, iron, copper, tungsten, manganese, silver, zinc, plumbago, mercury, and arsenic deposits have been found.

**COMMERCE AND FINANCE.** Excluding bullion and specie, imports in 1930 were valued at £19,602,382 (£23,495,898 in 1929) and exports (including reexports) at £24,920,067 (£40,718,135 in 1929). The aggregate revenue in 1929 amounted to £9,543,285 (£11,159,815 in 1928) and expenditure to £9,877,114 (£12,717,161 in 1928). The public debt on Jan. 1, 1930, stood at £9,355,000. Drastic revenue declines accompanied the depression of 1930 and 1931. Revenues in 1930 were 65,560,800 Straits dollars, leaving a deficit of 16,909,000 dollars. On June 1, 1931, import duties were raised in an effort to increase revenue by 5,000,000 Straits dollars (1 Straits

dollar being equivalent to \$0.5678 U. S. at par).

**COMMUNICATIONS.** Railway mileage open for traffic in 1929 totaled 1114 miles and in 1930 46 miles of new line were under construction. All railways are government owned or controlled. A 328-mile line connecting Gemas, Johore, with Tumpat, Kelantan, was opened Sept. 5, 1931, after 23 years of construction. This provided through rail connections between Singapore and the east coast of the Malay Peninsula, and passed through the States of Pahang and Negri Sembilan. Cart roads surfaced with broken stone extended 2734 miles (1929) and there were 1818 miles of bridle roads and paths.

**GOVERNMENT.** The states are under British protection, with the Governor of the Straits Settlements (q.v.) as *ex officio* High Commissioner. There is a native ruler, assisted by a British Resident, in each of the four states. High Commissioner in 1931, Sir Cecil Clementi. See **BRITISH MALAYA.**

**FEDERATION OF LABOR, AMERICAN.** See **LABOR, AMERICAN FEDERATION OF.**

**FELLOWSHIPS.** See **UNIVERSITIES AND COLLEGES.**

**FENCING.** Miss Marion Lloyd, representing the Salle d'Armes Vince team of New York City, was the foremost woman fencer in the United States in 1931. This young woman won the Metropolitan foils championship for the fifth consecutive year, led her team to its second straight national team championship, and capped the year by leading an invasion of Europe by a team of United States women. The tour was successful from every point in the winning of matches, 36 events out of 51 being won. In one match Miss Lloyd defeated Miss Helene Mayer, of Germany, 1928 Olympic champion.

Lieut. George C. Calnan, U. S. N., who was third with the épée in the 1928 Olympics at Amsterdam, retained his national foils honors, in the tournament held at the Hotel Astor in New York in April. John R. Huffman, won the sabre honors and Miguel A. deCapriles, professor of economics at New York University, captured the épée crown. The fencers from West Point won the three-weapon as well as the épée championship at the Intercollegiates, and Columbia took the sabre and Harvard the foils titles. It was the first time in many years that Yale had not captured at least one team championship, although John F. Potter of Yale did win the individual foils honors. Haakon Gulbrandsen of Columbia won the individual sabre crown and Cadet Gustave Heiss of the Army the épée title. New York University won the women's intercollegiate team title and Miss Elizabeth Ross, of Cornell won individual honors with the foil.

**FERTILIZERS.** Due mainly to the low purchasing power of agriculture, the total consumption of fertilizers for the year in the United States was only about 75 per cent of the consumption in 1930, and apparently much of this amount was moved at a loss to the fertilizer industry. There was a sharp decline in production of fertilizers throughout the world which was accompanied in most quarters by a decline in wholesale prices. Price decline was especially marked in the nitrogen industry and all the countries engaged in production on a major scale noted a marked export reduction.

However the industry continued to take advantage of the rapid developments in the production of new fertilizers, especially the more

concentrated materials and was seeking more efficient and cheaper methods of production to offset the decline in prices. The perfection and use of new inorganic fertilizers and the gradual elimination of low grade fertilizers continued. According to the National Fertilizer Association the increased concentration of the fertilizer materials sold represented a considerable increase in plant food consumption. The researches and investigations again were concentrated largely on the development of new and cheaper manufacturing processes and the improvement of those already in use, the production of new fertilizer compounds, the development of new sources of raw materials, and the more efficient utilization of available fertilizers.
